culture. She reserved her minimal maternal instincts for little Claudia, who remembered her as a gentle figure, who liked to play records of Italian operas on her Victrola and read Norse tales aloud. Neighbors saw a less benevolent figure, who showed little interest in anyone but herself. On the rare occasion she took a stand on a community matter, T.J. was sure to be found on the opposite side. Her sole foray into politics is a case in point. After Texas granted women the right to vote in primaries in 1918, Minnie began crusading against a popular local candidate, whose relatives were T.J.'s friends. The candidate had been a "slacker" in the war, she argued, and did not deserve public office. T.J. and Minnie disagreed on just about everything. She still liked to travel, to attend musical events in Shreveport, fifteen miles away in Louisiana, and confer with doctors at the Kellogg Sanitarium. He stayed close to home, going to bed early so he could be up and at work before sunrise. The half of Harrison County that was African American interested him only as subjects for exploitation, but she assembled a few of them in her living room to talk about their religious practices. (She claimed she wanted to write a book on the subject but aggravating T.J. seems a more likely motivation.) He continued to strike back in ways that humiliated her. When a dog sniffed him out at his store one day, T.J. turned to a customer and said, "I've been with a black woman and that dog can smell her on me." What clearer evidence does one need to show that Lady Bird grew up in a home where marital fidelity carried little weight? The black youth named Sugar who came past the store for handouts was widely believed to be T.J.'s son, half brother to his three children borne by Minnie. What Lady Bird called a "stressful" marriage was actually one from hell, as the adults she called Mother and Daddy fashioned a reunion on the shards of a bitter, multiyear separation. Her brother Tony captured some of the rancor in that died, in mysterious circumstances that continue to raise questions nearly a century later. Was it suicide, as some Marshall residents believed? A botched abortion, as others suggested? Or did one historian get it right when he relayed rumors that T.J. had "pushed her down" a flight of stairs? Claudia, only five years old at the time, remembered little of her mother's death, and since her father permitted no discussion of the subject, she was unlikely to learn more. The sketchy version she relayed as an adult has become the accepted one—that Minnie, forty-four years old and pregnant, was tripped by a dog, causing her to fall down the stairs of her home, and then die from a subsequent infection. The graphic details haunted one of Minnie's granddaughters, who admitted that during her own pregnancies she stayed on high alert whenever a dog came near. Other information about Minnie's death raises strong doubts about whether a dog had anything to do with it, and the disappearance of documents that would help resolve those doubts maximizes the suspicion. Minnie's death certificate, on file at the Harrison County Courthouse, gives the cause as "septicemia," commonly called "blood poisoning," but not commonly associated with falls. Although the official date is September 4, multiple family communications place it ten, or even fourteen, days later. Tommy and Tony, aged seventeen and thirteen at the time, could offer little in the way of verification. Still hundreds of miles away, they did not learn of their mother's death for a full year because their father did not tell them.

While it would require an autopsy to pinpoint the exact cause of Minnie Taylor's death, a betting person would put money on a botched abortion. Septicemia frequently resulted—and was often fatal—when women tried to abort using metal objects. Since it was common knowledge around Karnack that she was pregnant, she must have been in an advanced stage. Yet neither her tombstone nor death certificate mentions a fetus or stillborn child. Since she had already sent her sons away and was investigating boarding schools in Washington, D.C., for little Claudia, it is reasonable to suspect she would not welcome a fourth child. She was buried, without a funeral service, within twenty-four hours of her death, highly unusual in that county at the time, and it was another physician, not the trusted neighbor, Dr. Baldwin—who had attended Claudia's delivery—who signed Minnie's death certificate. Issues of the county newspaper, which might fill in details of what happened, are missing for those weeks from the archives at the newspaper office and from an otherwise complete collection at the local college. Most suspicious of all is the completeness with which Minnie was erased from her children's lives. Not a single photograph of her survives, indicating that whoever possessed pictures taken of her during the forty-four years that she lived was very angry with her. And T.J. was certainly angry. The only time Lady Bird saw her father fly into a rage was when the local minister tried to console him by saying he should view his wife's passing as "the will of God." Whatever its cause, Minnie Taylor's death left her daughter, five months short of celebrating her sixth birthday, even more isolated. Without those tenuous ties that had once connected her to a remote, often absent mother, the lonely child became even lonelier. Claudia would later hear talk about her mother, how she treasured fine leather bindings on her books and liked to wander alone through the fields. But the picture emerged only in shadowy outline, like that of a distant mother's nighttime stories, he offered to read aloud to her. It was the first time, she later admitted, that she knew he could read. But this was busy cotton season, and he soon decided to cart her off to visit her Alabama cousins five hundred miles away. Rather than engage an adult to accompany her, he hung a sign around her neck and put her on a train. The sign, which read "Please deliver this child to Claude Pattillo, Autauga, Alabama," functioned perfectly, and she arrived without mishap. Behind the sign, a smart little five-year-old was learning the value of self-sufficiency. After his daughter returned to him, T.J. decided she needed a woman's guidance, and he invited Minnie's younger sister Effie to come and live with them. It was a little like asking an injured hunt dog to take care of the pack. Effie Pattillo, who had shown considerable talent as a pianist in her youth, was now in her early forties, a fragile, wispy woman for whom the phrase "having the vapors" could have been invented. Smaller and physically weaker than Minnie, Effie had grown to adulthood pampered like an invalid, and much as she valued appearing the "real lady," she acted more like a spoiled child who took little responsibility for financial decisions or other life choices. Shielded by Papa Pattillo's wealth and standing in the community, she had the luxury of not having to worry about what others thought of how she dressed or acted, and so she became more and more the eccentric bystander. Aunt Effie deserves some credit. She widened her niece's view of the world by taking her along on trips to the Kellogg Sanitarium, and she tried to foster what Minnie had started, introducing Claudia to nature's pleasures, teaching her to appreciate a colorful field of wildflowers or the special light of a setting sun.

T. J. Taylor's huge landholdings provided the space for exploring those joys, but neither he nor Aunt Effie could provide the reliable companionship of the "piney pine" woods and "true blue" wildflowers that had sustained Minnie in a place she hated. Nature was her preferred solace, and it would take center

stage in her daughter's life. As Lady Bird explained later, nature was "my daily companion. My kingdom, my place, my love." Outdoors, walking across her father's acres, she could shut out ugliness and forget the envious glances of the neighborhood children who had far less than she. To transport her to a world of her own, she supplied her own soundtrack, by humming to herself or whistling. The country house that T.J. had bought for Minnie was just the place for their daughter to develop a rock-hard self-sufficiency. With both brothers away at boarding school and only the children of hired help for playmates, Claudia Taylor had plenty of time to herself, to invent games she could play alone, to observe her father's strutting peacocks, to gaze off into the distance at the verdant hills and lush forests. After T.J. built her a detached two-room playhouse, she isolated herself within its walls, even sleeping there at night. Sometimes, as if pulled by a magic cord still connecting mother and daughter, the young Claudia descended the mansion's front steps and set off to ramble for hours across T.J.'s fields, just as her troubled mother had done before her. Did she imagine herself following paths her mother had crossed, sitting on rocky outcroppings where her mother had once stopped to rest and observe the exquisite scenery? As an adult, Lady Bird would always trace her love of the outdoors, its beauty and serenity, back to those solitary years in Karnack's meadows. Driven by her own curiosity and guided by Aunt Effie, she developed an encyclopedic knowledge of wildflowers, so that she became to botany what Theodore Roosevelt was to insect study—she rarely met a species she could not identify. It questioned about her own interest in wildflowers, admitted, "It did not come with the genes." By the time Claudia was no more than ten or eleven, she had figured out that Aunt Effie was someone to love, but a woman that "passive . . . weak and full of illnesses" did not provide a model to follow. Young Claudia set her "sights on being more like my father, who was one of the most physically strong people I have ever known." Lady Bird was very much T.J.'s daughter. Not only her dark hair, olive coloring, and oversized nose came from T.J. Taylor, but far more important, the ambition, business savvy, and almost incredible attention to ferreting out every cent in any exchange. She clung to his example in ways her brothers, separated from him at a young age, never did, and she became the risk taker in much bigger ways than they ever did. T.J. clearly loved and nurtured his only daughter, and he raised her, to a large extent, as if she were a son. At least he made no exceptions for the fact that she was a girl. He taught her the rules of success as if he fully expected she would one day run a business herself. Just as importantly, he made her comfortable with the idea of raw power, even if questionably achieved. Although T.J. was busy as local employer, lending banker, and "dealer in everything," he also served as his daughter's tutor—by example. He never read a book for pleasure, but he was a demon with numbers. Even the tiniest entry on the ledger drew his attention, and his daughter, who would later be described as able to read a balance sheet the way a truck driver reads a map, learned from him. She had her own checking account by the time she reached puberty, and she viewed it as distinctly hers. Informed as an adult that some of her female employees had joint checking accounts with their husbands, she retorted that she

"wouldn't share an account with the Angel Gabriel." T.J.'s talk of his own impoverished youth, of his mother being unable to provide "tea cakes" even at her children's birthdays, convinced Claudia that he wanted far more for her. She understood why for him "value-of-a-dollar" was one word. Unlike most people who knew T.J., his daughter saw only benevolence and kindness in him. She often talked about the time she inquired about a row of large wooden boxes in his store and he had assured her they were packing units. Only later did she learn they were coffins. Most of Karnack's population emphasized his miserly, manipulative ways, but she singled out his rare acts of charitableness, like extending credit to the family of her good friend, Emma Boehringer, whose father had died, leaving his widow with little to support herself and her children. For Lady Bird, T.J. was a gentle, compassionate figure while others were more likely to use the term his father-in-law relished—"the meanest man" around. Young Lady Bird was too smart not to know how T.J. was making his money. Although some of it was legitimately and fairly earned, much of it came from underhanded tactics and squeezing out his weaker neighbors. At the "company store" he operated, he took advantage of local residents who didn't have the means to go elsewhere, and he gouged them on prices. When local lumber mill workers went to his store with the chits in which they had been paid, he gave them less than face value toward their purchases, but he demanded full credit when he cashed in the chits at the mill. He kept hiring men to fish with nets in the neighboring Caddo Lake even after the state legislature prohibited net fishing. Not until a game warden burned his nets did he stop. This was the same Caddo Lake where his daughter liked to hang out in summer. As soon as she was old enough, she went with friends to picnic on its banks, under ferny cypress trees, and swim in its murky, green water. In spite of remained her hero. As Karnack's privileged little rich girl, Lady Bird learned early how to focus on the reality that worked to her benefit and block out the rest. Later in life, she talked about being able to stick her head in the sand, but her associates offered other descriptions of how she managed to ignore unpleasantness. One White House colleague noted she "had resources most people don't have"; she would start whistling and will herself into a place "of birds and sunshine." One acquaintance described her "veil" as a "Southern thing," that came down when she needed to block something out. Her longtime friend Harry Middleton observed, "She put on her mask and let the world go by." Historian Doris Kearns Goodwin called it "psychic leave," and said she witnessed it many times. Lady Bird would be sitting there, in body only, until Lyndon called out, "Bird, are you with me?" Then she would snap back. • • • The tiny one-room Fern School that Claudia Taylor started attending the year after her mother died offered limited companionship. Enrollment rarely reached ten, and when the number dropped to only two or three, the teacher moved classes to T.J.'s Brick House. After six years at Fern, with its potbellied stove, Claudia enrolled in a considerably larger school in the more upscale Jefferson, ten miles away. Sharing a room with Aunt Effie, she learned to imitate the deep Southern accents of the two retired schoolteachers who ran the boardinghouse,

and to roll her eyes, like them, when she wanted to feign ladylike ignorance. With those retired schoolteachers, she had two good examples of how a show of feminine weakness could mask real power. Cut off from so much in life, young Bird learned to disappear into books. Like her mother, she could spend hours at a time with only printed pages for company. She later singled out "The Emperor's New Clothes" by Hans Christian Andersen as an early favorite. One family acquaintance remembered driving up to the Brick House and seeing the eight-year-old girl on the front porch, a copy of the tome Ben-Hur in her little hands. Although T.J. had little schooling, he wanted the best for his daughter, but he was reluctant to send her away. When it came time for high school, he assigned one of his employees to drive her the fifteen miles to Marshall, the county seat. T.J. put little stock in keeping his vehicles clean, and Minnie's daughter was embarrassed when classmates saw her being delivered each day by a dusty truck that smelled of cowhides. Besides, ferrying her back and forth took a driver's valuable time. So T.J. bought her a car of her own when she was only thirteen, and since Texas did not require a driver's license at the time, she drove herself back and forth. Her privileged status did not go unnoticed. "She had her own car," one jealous classmate remembered, "when my family didn't even have a car." T.J. had his reasons for granting his daughter her independence. In 1920, two years after Minnie's death, he married his attractive young bookkeeper, Beulah Wisdom, twenty-four years his junior. Local residents knew her as a "looker" who wore the latest flapper fashions, the kind of woman only a rich man could hope to have. Eight-year-old Claudia did not see her new stepmother as a role model, and, when later asked, as an adult, if she found Beulah attractive, she said, "Yes, in a coarse and crude sort of way." The class chasm between the mercy of whoever was willing to take her in. Some of the Pattillo clan clearly welcomed the child and introduced her to watermelon evenings and Sunday picnics; they took her along on sightseeing trips to neighboring states, even as far as Colorado. Always aware that she was the visiting outsider, on probation, she was careful to mind her manners and look grateful as they bounced her from one household to another. One cousin recalled seeing this perfectly groomed little girl, arriving as the lone passenger in the backseat of a large car, her full skirt carefully spread out around her as if she did not mean to be touched. By the time she was in high school, Claudia Taylor sounded like T.J. on subjects such as finances and international relations. These were written assignments, rather than topics she picked herself, but already, at age fourteen, she appeared opinionated, arguing that the United States should grant independence to the Philippines, not because it was right

but because it would give the U.S. a monopoly on all rubber produced there. In another high school essay, on the subject of whether the United States should cancel debts it stood to collect from European nations, she wrote that she favored cancellation, not "because of sympathy" or because it would make other countries "like us better," but because it would help get those nations back on their feet and in a position to buy American products. Sounding like a cagey, mature bookkeeper, she admitted that $26 billion was "a large sum to erase from the 'right side' . . . of the ledger,"

but she reminded her reader that the U.S. "could make more money" from a strong Europe than from one strapped with debt. It's no wonder her classmates predicted a bright business future for Claudia Taylor when she graduated from Marshall High at age fifteen. The yearbook compared her to Erie Halliburton, the famed entrepreneur locally revered as the man who started out with only a borrowed wagon and a mule but quickly extended his oil and gas empire around the globe. That judgment was very much on the mark. Late in life she admitted that had she not married Lyndon, she would probably have become a businesswoman. At high school graduation, she was not yet set on that course but she was determined to strike out on her own. Staying in Karnack meant constant contact with her flashy, unsympathetic stepmother, and accompanying pathetic Aunt Effie to Alabama was equally unappealing. From the daughter of the local Episcopal rector, she learned about St. Mary's College, an Episcopal boarding school for girls in Dallas, and when she told T.J. she wanted to go there, he agreed. (She later said she hoped she granted her own daughters the same independence he gave her.) In Dallas, she would have a big city (population 158,000) and a chance to smooth out the rough edges of the schooling she had received in Marshall (population 14,000). St. Mary's wasn't exactly what her mother had in mind when she investigated boarding schools in Washington, D.C., but it appeared likely to offer similar rewards. The two years Lady Bird spent at St. Mary's gave her a chance to remake herself. After a religion teacher introduced her to a different version of Christianity than she had heard in the fundamentalist Baptist sermons in Alabama or the Methodist teachings in Karnack she decided to convert to Episcopalianism. An English teacher awakened her to the richness of her native language and encouraged her to write with vivid phrases: "Don't just say 'a man lightning lit up the landscape.' " St. Mary's gave little importance to domestic skills, like cooking and sewing—students at St. Mary's expected to have others do those tasks for them. But it was there that Claudia learned the excitement of live theater. In the world of drama, she could lose herself, and theater became a mainstay pleasure of her adult life. "I loved the theater," she would say: "I fed upon it." The young Lady Bird was game for adventure. On a trip to Shreveport, she insisted on going up in a tiny airplane, even though the wings looked precariously attached with wire. Her friend hung back, but Lady Bird loved it and called it "the most exciting ride of my young life." Fearless at the wheel of a car, she relished driving herself around. Both her mother and Aunt Effie had owned cars but relied on others to operate them, illustrating a kind of dependence that was not for Miss Claudia Taylor. When Aunt Effie needed her car driven the five hundred miles back to Autauga, Alabama, her sixteen-year-old niece volunteered to do it, accompanied by a friend the same age. Detained by road construction and the need to wire T.J. for more money, the two teens finally arrived more than a day late, in the middle of the night, at the home of a very anxious relative in Alabama. Before she turned eighteen, Claudia Taylor had formed the traits that would define her adult life. From her father she had learned the value of every cent and the importance of taking risks. From her mother came the equally strong pull to lose herself in nature and drama, in words and dreams of faraway places. The Southern belle demeanor she had absorbed from Aunt Effie and the two ex-schoolteachers in Jefferson, Texas, fooled many people, and when she rolled her eyes and drawled her vowels, she appeared soft and pliable. But her childhood

had toughened her, and she had mastered the priceless technique of insulating herself against intrusion and hurt, encasing herself in a protective cocoon that no one could breach. She could rationalize—or ignore—the shortcomings of others, even those adversely affecting her, without sacrificing a whit of her dignity. She had prepared herself to do what her mother never did—leave Karnack for a more exciting life.

Unlike her husband, Bird insisted on authenticity in her press releases and correspondence. He liked to put a grandiose slant on his naval service, describing it as a "mission for the President." One staffer picked up the phrase and used it in a letter to a constituent, explaining that Congressman Johnson was not in his office but "serving his country where the President considers he is most needed." Bird, in checking that letter, circled the phrase about the president and penned in as did most of the others. In her husband's absence, Bird continued his efforts to funnel federal money to Texas. Even before Pearl Harbor, Congress had allocated $10 billion for defense contracts, and Lyndon immediately started pushing for locating a military base in his district. Austin's mayor and other city leaders also pressed the case but the competition was fierce in early 1942, and the final decision was looking "a little bit too close." With people back in Austin eager to get a plum military installation there, Bird went to a key figure, assistant secretary of war for air Robert Lovett, and reiterated the advantages of the 10th District. When she left she wasn't sure of the outcome but the press secretary side of her asked for another favor. Before the decision was announced, she wanted Lovett to give her advance notice so she could issue the press release and make sure her husband received credit for his efforts. It is impossible to know what weight she carried in the final decision, but in September 1942 a military base, later renamed Bergstrom Air Force Base, opened on three thousand leased acres in Lyndon's district, and the congressman's name figured prominently in the announcement. Lady Bird Johnson's role in funneling more money to Texas, to a defense plant hundreds of miles away from Lyndon's district, is even more intriguing. The federal government, in its rapid conversion to a war economy, had to open up factories all across the nation to produce whatever its servicemen needed to fight—ammunition and guns, uniforms, fighter planes. While some factories could retool—to make tanks instead of cars—others had to start from scratch, and countless towns wanted the privilege of starting them. Among the winners was tiny Karnack, Texas, where Lady Bird's father still lived. Not all of the land

for Longhorn Ordnance Works came out of T. J. Taylor's considerable holdings, but a lot of it did. By mid-1942, he and his then wife, Ruth, were busy buying land from their neighbors and selling it to the government, sometimes for nearly twice what others received for the same acreage. In the month of August alone, T.J. and Ruth Taylor recorded $70,000 in land sales, equivalent to more than $1 million in 2014 dollars. There was nothing illegal about the land deals—T.J. had been buying and selling bits of Harrison County for more than forty years. But the rapidity of his acquisitions in 1942, followed by quick resale at inflated prices, does raise the question of whether he had inside information about the location of the new ordnance factory. Since Lady Bird and Lyndon had signed away any claim to her father's immediate profits, there is no paper trail connecting them to his windfall. But the question remains: Was Bird using her Washington network to gather information that substantially increased her father's net worth? As the summer of 1942 ended, it must have felt a lot like Christmas in T.J.'s big Brick House. Bird had come back for a visit and her two brothers had their own reasons for celebrating. Tony showed up with a new bride, Matianna, and Tommy, who still lived in Texas, had become the proud father of a baby girl. With Longhorn Ordnance set to open, the local economy looked good. During the half year that Bird managed Lyndon's congressional office, she performed so flawlessly that some of his constituents didn't even know he was gone, and others suggested she could win a House seat on her own if she chose to run. Jake Pickle, who handled the Texas office until he, too, went off to fight, praised the "bang-up job" she was doing. He proposed organizing some extra publicity for her: "I feel we could and should get some good

stories and features about her work. It would go over big." But Lyndon, always a little squeamish when anyone but himself was getting credit, did not push for flattering articles excel, taunting her that anyone with two degrees from the University of Texas should certainly be able to manage the project he had in mind. But when she delivered—making a useful contact or solving a thorny problem—he could turn petulant, not liking to be upstaged.

Diana Lee Taylor (born 1933)

Also known as Diana Lee Taylor MacArthur (born 1933)

Born - July 7, 1933

- Parents -
  - **Mother** is Julia Elizabeth Sibley (born 1905, passed in 1961) ...
    - Julia Elizabeth Sibley was Born Julia Elizabeth Steele (1905)
    - Julia Elizabeth Sibley married Antonio Jefferson Taylor (born 1904)
    - Divorced
    - Second marriage was to Charles Noel Sibley (born 1899) (of United Fruit Company) -
      - Thus Charles Noel Sibley (born 1899) is the **stepfather of Diana Lee Taylor**
  - **Father** is Antonio Jefferson Taylor (born 1904) (his father is Thomas Jefferson Taylor II (born 1874))
    - Married Julia Elizabeth Sibley (bonr 1905)
    - Divorced
    - Second marriage was to

Married as second husband, **Dr. Donald Malcolm MacArthur** (born 1931) , Pentagon bioweapons chief(1931-1988).

She has lived most of her life in Santa Fe, New Mexico, with a house in the Washington DC area.

Her father, Antonio Jefferson Taylor, was the brother of Lady Bird Johnson, wife of President Lyndon Baines Johnson.

She was President of Dynamac Corporation after 1988, a company founded by her husband Dr. Donald Malcolm MacArthur (born 1931) in 1970 .

2013 (Sep 3) - Bio in "The Santa Fe New Mexican" newspaper

Stepfather Charles Noel Sibley (born 1899) worked at United Fruit Company .

DIANA MACARTHUR

Diana MacArthur is a Santa Fe native. She was born at St. Vincent Hospital on Palace Avenue in 1933. Her parents, Elizabeth and Antonio "Tony" Taylor, were from East Texas. Her father was Lady Bird Johnson's brother. He was the first student at the Los Alamos Ranch School for Boys and later returned to the Santa Fe area as a tuberculosis patient.

MacArthur and her older sister, Gerry, were great friends of the three Ruthling children, Theo, Ford and Carlton. The sisters often stayed at the Ruthling ranch, where they slept outside in covered wagons, even in winter. The children all took dancing lessons from Jacques Cartier.

MacArthur's parents divorced, and she lived with her father and her father's wife, Matianna "Matti" Vigil. Her mother married Charles Sibley, a career employee of United Fruit Company. The first time MacArthur and Gerry visited them in Guatemala, the girls were 7 and 14. They traveled alone, taking a train through the Mexican jungle, and crossing the river that was the border between the two countries in a dugout canoe.

On a later trip to visit her mother, MacArthur sailed in a United Fruit Company boat. When the boat docked in Havana, she toured the city by herself at age 12.

She attended Loretto Academy and Harrington Junior High, before going to boarding school in Pennsylvania.

In 1955, she received a bachelor's degree in economics, with Phi Beta Kappa honors, from Vassar College.

She married and had her first child, Elizabeth in her senior year. Her husband, Nikolai Tschursin, was an émigré from the Soviet Union. Their son, Alexander, was born in Santa Fe.

The couple divorced after five years, and MacArthur raised her children as a single mother in Washington, D.C. She often spent time with her aunt Lady Bird and uncle Lyndon B. Johnson when he was speaker of the U.S. House of Representatives.

In 1962, MacArthur married Donald MacArthur, a Scottish scientist. He founded a firm, Dynamac, which she continued to run for 20 years after his death in 1988. She eventually sold the firm to another woman-owned company.

When Lyndon B. Johnson was president, he appointed MacArthur to the President's Council on Youth Opportunity. Under President Bill Clinton, she served on a committee of advisers for science and technology that included the Massachusetts Institute of Technology president, three Nobel Prize winners, the president of Lockheed Martin and President Obama's current science adviser.

Today, MacArthur lives on a ridge overlooking Tesuque. "One always knows, if you are born in Santa Fe, where you will retire," she said.

Her son lives in Santa Fe, as does her grandson, Nikolas. Her daughter died in 1994.

OF NEW MEXICO

105th Year, Issue No. 294 SANTA FE, NEW MEXICO, SUNDAY, NOVEMBER 7, 1954 B Section

Diana Taylor Is Married In New York

Of wide interest here is the Oct. 24 wedding in New York City of Diana Lee Taylor to Nikolai Tschurin. She is the daughter of Anthony J. Taylor and Mrs. Taylor of this city. The bride's parents were present for the ceremony returning to Santa Fe at mid-week.

Vows were exchanged at the Russian Orthodox Church on West 77th St. An all Russian choir directed by Boris Litkowsky sang for the service.

The bride's wedding dress was of ivory satin fashioned with molded bodice with full skirt flaring over foamy white underskirts. A fingertip tulle veil was attached to a dainty crown of orange blossoms. White roses formed her bridal bouquet.

Attending the bride as matron of honor was Mrs. Irving Glick of Great Neck, Long Island. Two classmates from Vassar, Miss Ann Bartholomew and Miss Vera Schnell, were bridesmaids. A special escort of three classmates from Smith College who had studied abroad with the bride last year was also present.

Attending the groom were Dimitri Tremble of New York City as best man, Michael Lineman of Washington, D. C., as ring bearer. In the Russian tradition, crowns were held over the heads of the couple during the entire ceremony. Bearers of the jeweled crowns were Horace Anderson of Santa Fe and M. Platanof of New York.

Immediately following the ceremony a wedding dinner was held at Hotel Fifth Avenue. Among the New Mexicans attending were Mr. Anderson and Mrs. Anita Anderson of Santa Fe, Mr. and Mrs. Paul Markman formerly of Albuquerque, Mr. and Mrs. Frost Roehsler, Mr. and Mrs. Taylor, parents of the bride; and Mrs. Jack C. Hopkins, sister of the bride.

After a honeymoon in Washington, D. C., the bride returned to Vassar where she is a candidate for her degree in June, 1955.

The bridegroom was born in Rostov-on-Don, Russia. His father was mayor of that city at the time of German defeat at Stalingrad and he and his family following the retreating German Army back to Germany. After several years of dodging the Soviets, they escaped to America under the Displaced Persons program. Mr. Tschurin recently completed service with the U.S. Marine Corps and is now a student at George Washington University in Washington, D. C. The young couple will reside there following the bride's graduation until he receives his degree two years hence.

They met through the bridegroom's mother, Mrs. V. Fram, who resides near Vassar in Poughkeepsie, N. Y.

GS LEADERS MEET WEDNESDAY

A final session of the basic course for Girl Scout leaders will be held at the Scout office Wednesday from 9:30 a.m. to 3 p.m. This work will conlcude the sessions begun last month under direction of

EXCHANGING VOWS in a Russian Orthodox service in New York City are Miss Diana Taylor, daughter of Anthony J. Taylor of Santa Fe and Nikolai Tschurin, son of Mrs. From of Poughkeepsie, New York.

THE SANTA FE HIGH SCHOOL BAND is one of the best known such organizations in New Mexico. During football season they perform as a marching unit switching to a concert band in mid-November. Wednesday is opening day for the annual drive for the Santa Fe Band Parents Association. Tickets go on sale at that time for four concerts scheduled for spring presentation. Pictured are Horacio Manzanares, Louise Hall, Bobby Felix, Jimmy Sikes and Candy Wilson. Just to prove how much the youngsters enjoy band under direction of Bennett Shacklette look at the broad smile on Louise's face. Must have been something very funny. (Max Spring, staff photographer)

Karnack Services Conducted For Thomas J. Taylor

MARSHALL, Tex.—Services were conducted at 4 p.m. Sunday at Karnack Methodist Church in Karnack for Thomas Jefferson Taylor, 86, father of Mrs. Lyndon B. Johnson, wife of the Democratic vice presidential nominee, who died in Memorial Hospital in Marshall about 3:15 p.m. Saturday.

Burial was in Algoma cemetery in Marshall. Officiating ministers were the Rev. R. E. Bischoff, pastor and the Rev. Billy Bonner, a former pastor.

Mr. Taylor was born in Alabama Aug. 29, 1874, and came to Karnack in 1899 when he was 25 years old. He opened a general store and erected a sign "Dealer in Everything" which identified the establishment as serving the entire area. He invested continuously in Harrison County land to become one of the largest landowners in East Texas.

His store is just outside the Longhorn Ordnance Works reservation, most of the Longhorn site having been acquired from him.

He also "dealt in everything," lending financial assistance to numerous individuals which from time to time had him in contracting, automobile, sawmill, fishing and other businesses.

Mr. Taylor was a lifelong member of the Methodist Church and had been a member of the Karnack Church for 60 years. He also was a continuous benefactor and erected the Sunday School building, which is known as Taylor Hall. He also presented the church with its organ.

Taylor had suffered a heart ailment for the past 15 months and had been in the Marshall hospital most of that time.

Besides Mrs. Johnson, Mr. Taylor is survived by his wife and a son, Antonio J. Taylor, of Santa Fe, N.M.; a sister, Mrs. Ida McKay; three half-sisters, Mrs. J. D. Jones Sr., Mrs. Harris Cory and Mrs. R. M. Prather, and a half-brother, Cecil Bishop, all of Prattville, Ala. Another son, T. J. Taylor Jr., died last summer.

— Hessler Studio

Diana Taylor Tschursin, Dr. MacArthur Will Wed

Antonio J. Taylor of Santa Fe announces the engagement of his daughter, Mrs. Diana Taylor Tschursin of Washington and New Mexico, to Dr. Donald Malcolm MacArthur of Washington and Stornoway, Scotland.

Mrs. Tschursin is the daughter of Mr. Taylor and Mrs. C. Noel Sibley of Marshall, Texas, and is the niece of Mrs. Lyndon B. Johnson. She attended the Shipley School at Bryn Mawr, Pa., and was graduated Phi Beta Kappa in economics at Vassar College in 1955. She is a vice president of the Thomas J. Deegan Company of New York City.

Dr. MacArthur is the son of Mr. and Mrs. Donald J. MacArthur of Scotland. He was graduated with a bachelor of science degree from St. Andrews University and graduated with a Ph.D. degree at the University of Edinburgh in 1957. He is the director of the Chemical and Biological Sciences Laboratories at Melpar, Inc. near Washington.

The couple plan a fall wedding.

Mrs. Julia Sibley Dies

Mrs. Julia Elizabeth Sibley, 58, died about 6:30 a.m. Thursday at Memorial Hospital after a short illness. She made her home at 1309 Mobile, Marshall.

Funeral services have been arranged for 4 p.m. Friday at the Colonial Chapel of the Sullivan Funeral Home. The Rev. William H. Benchoff, minister of the First Presbyterian Church, is to conduct the services. Burial is to be in Greenwood Cemetery.

Pallbearers are to be Bob Steele Jr., Reuben Ford, Herman Shivers, William Lane Jr., George Sullivan, Winston Taylor, Pat Allen and John DeWitt Furrh.

Honorary pallbearers are to be Dr. Robert Jones, Dr. Robert L. Koenig, Dr. S. W. Tenney, her friends and members of her family.

Mrs. Sibley was born on Sept. 2, 1905, in Marshall, the daughter of the late Dr. Madison D. Steele and Mrs. Julia Muntz Steele. She was a member of the First Presbyterian Church.

Surviving are her mother, Mrs. Julia M. Steele, her husband, C. Noel Sibley, four daughters, Mrs. Gerry Taylor Hopkins, Santa Fe, N. M.; Mrs. Diana Tschursin, Washington, D. C.; Mrs. Gwynne Barrias and Mrs. Thelma Lucero, both of Guatemala; one son, Pvt. Charles Sibley, in the U. S. Armed Forces in Europe; three brothers, John Steele and Robert Steele Sr., Marshall; and Junius Steele, Augie, Puerto Rico.

Scientist Group For Johnson Organized Here

The newly organized Scientists and Engineers for Johnson and Humphrey raised approximately $600 the past weekend in campaign funds and named a temporary chairman.

Dr. Donald MacArthur, of Washington, was here to launch the statewide link to the national group.

Dr. MacArthur and his wife, the former Diane Taylor of Santa Fe, niece of President and Mrs. Lyndon B. Johnson, departed early Monday for Dallas to continue organizing a coast-to-coast network of organizations of technical people for the Democratic nominees.

Temporary Chairman Named

Dr. MacArthur met with some 40 persons — all technical and scientists — Sunday at the home of Dr. Sidney Solomon, 2406 Morrow NE. Leo A. Dunn, of Sandia Corp., was named temporary chairman.

Dr. Julius R. Blum, of the University of New Mexico, will serve as temporary treasurer and Victor J. Goetz, with ACF Industries, Inc., acts as publicity chairman.

Another meeting of the newly formed group is planned for 7:30 p.m. tonight at the First National Bank Bldg. East.

Seek Big Victory

Dr. MacArthur said the technical and scientists are organizing " . . . to make sure of an overwhelming victory for Johnson and Humphrey.

Albuquerque will serve as state headquarters. Plans include forming at least one group in each state.

The meeting here was preceded by similar sessions at Santa Fe and Los Alamos.

A top speaker in the scientific - technical community is expected to address the group before the Nov. 3 election.

LBJ Clan Members Share His Triumph

BY JOHN MORT
Star-Telegram Washington Bureau

WASHINGTON, Jan. 20—President Johnson's Texas kin shared in his moment of glory Wednesday.

Numerous relatives of both the President and his First Lady occupied seats of honor among some of the nation's leading dignitaries at the inaugural ceremony.

Seated in the first row on the inaugural platform were Mrs. Johnson and their daughters, Lynda and Luci, with the First Lady placed immediately to her husband's right.

Other front - row occupants were the President's sister, Mrs. Birge Alexander of Fort Worth, her husband and their daughter, Becky, a University of Texas student; Mrs. Johnson's brother, A. J. Taylor of Santa Fe, N. M., and his wife; and two of the President's aunts, Mrs. Jessie Hatcher and Mrs. W. E. Saunders.

In the second row, seated next to U. S. Chief Justice Earl Warren, were Gov. John Connally, long-time Johnson intimate, and Mrs. Connally.

In the same row were Johnson's sister, Mrs. O. P. Bobbitt of Austin, and her husband; his brother, Sam Houston Johnson, also of Austin; and the Taylors' daughter, Mrs. Donald MacArthur of Washington.

Mrs. Johnson's sister-in-law, Mrs. T. J. Taylor Jr., and her daughter, Susan, were assigned third-row seats, along with two of the President's nephews, Phillip Bobbitt and Rodney White.

An uncle of the President, Huffman Baines Sr. of San Antonio, was in the fourth row, along with members of the cabinet.

Also on the presidential platform were Dale Miller of Dallas, chairman of this year's inauguration committee, and his wife.

The family of Vice President Hubert Humphrey also was well represented on the platform.

Mrs. Humphrey sat next to Mrs. Johnson, between the First Lady and the Johnson daughters.

Seated elsewhere on the platform were the Humphrey sons, Hubert H. III, Robert and Douglas; the daughter, Mrs. Bruce Salomson; and Humphrey's brother, Ralph, and his sister, Mrs. Frances Howard.

Three Beautiful Kin Of Lyndon Johnson Live Right Nearby In Captial

By VERA GLASER
Women's News Service

WASHINGTON (WNS)—Down Texas way relatives of the Lyndon Johnson are a dime a dozen, but few know they have three beautiful kinfolk living in the nation's capital.

Roxanne George, the President's niece; Patsy Derby, the First Lady's cousin; and Mrs. Donald MacArthur, her niece, discreetly play down their White House ties. People who see them daily often are unaware of the exciting relationship.

But having "Uncle Lyndon and Aunt Bird" in residence at 1600 Pennsylvania Ave., the girls admit, gives life in Washington a certain zest. The trio has been invited to glamorous official functions and occasionally find themselves swept up in spur-of-the-moment activities.

One Sunday morning 23-year-old Roxanne, daughter of Sam Houston Johnson, the President's brother (after her mother's remarriage to O. C. George of Mattoon, Ill., Roxanne was legally adopted), encountered the First Family at St. Mark's Episcopal Church services.

They took her home for a swim in the White House pool. A guest that day was Thomas Mann, later to be named Assistant Secretary of State for Latin American Affairs.

Another time she was a last-minute guest for Sunday lunch in the private living quarters of the Executive Mansion, along with the Clark Cliffords and Abe Fortases, long-time Johnson advisors, and Defense Secretary and Mrs. Robert McNamara.

Chuckling, Roxanne recalled the President's fund of funny stories and his enjoyment of a huge new battery-operated pepper mill at the dining room table. She lived with the Johnsons during her early days in Washington, both at the Sheraton Park Hotel and The Elms, his vice presidential residence.

Patsy, a slim, blue - eyed blonde, is working for her master's degree in American government at Georgetown University. Her mother, Mrs. Frank Derby of York, Ala., and Mrs. Johnson are first cousins. Patsy has been invited to White House receptions, occasionally helping Mrs. Johnson by serving as a hostess.

She shares a four-room apartment in Georgetown with Roxanne, who works for the Arms Control and Disarmament Agency as staff assistant. A graduate of MacMurray College in Jacksonville, Ill., Roxanne speaks fluent French, was assigned to Geneva last year for the disarmament talks, and hopes to return for the next conference.

"Lady Bird never ceases to amaze me with her thoughtfulness," Patsy said, "She took time out from a receiving line at the Smithsonian Institution to ask me about Roxanne when she was in the hospital." Later the Johnsons telephoned and sent flowers from Texas to their pretty niece.

Diana MacArthur, a graduate of Shipley School and Vassar, is the daughter of Lady Bird's brother, Tony Taylor, a Santa Fe, New Mexico importer. With her scientist husband and two children, 10-year-old Elizabeth and Alexander, 8, she lives in a spacious Dutch colonial home filled with paintings and art objects from the American southwest, Europe and Africa, meanwhile working as a consultant to the Peace Corps.

One evening, after a late dinner with the Johnsons, the MacArthurs were invited to spend the night. They slept in the historic Queen's Room, an elegant red-and-white chamber which has been occupied by the sovereigns of England, Greece and the Netherlands, just down the hall from the President's bedroom.

During the recent campaign the MacArthurs left their jobs to organize scientists, engineers and physicians for Johnson - Humphrey, signing up 150,000 members and raising $500,000 for the Johnson ticket.

Patsy worked in the campaign, too, first with the MacArthurs, then as a blue-clad hostess aboard the colorful "Lady Bird Special," Mrs. Johnson's Southern campaign train. After the election, she took a job at the inaugural committee before resuming her studies.

Bursting its seams, the girls' apartment was virtually a second inaugural headquarters during that eventful week. Patsy's mother stayed there. The Georges came from Mattoon, as well as Roxanne's "real" father who stayed in the White House. A special beau from Switzerland crossed the Atlantic to be with Roxanne during the ceremonies and festivities.

All three of their Washington kin have been invited by the Johnsons to sit in the presidential box when the Chief Executive addresses Congress. Patsy heard the State of the Union message. Diana and Roxanne were present when he delivered his first speech following the assassination of the late President Kennedy.

Lady Bird gets credit for bringing Roxanne and Patsy together in what has blossomed into a firm friendship and fulfilled living arrangement. She invited them both to Lynda Bird's high school graduation party, a Hawaiian luau given at The Elms in 1962.

Last November the pair surprised the Johnsons on their thirtieth wedding anniversary, calling at the White House with a bouquet of thirty yellow roses.

"We've always had a close family relationship," Roxanne said. The President gave the commencement address at her college graduation. She confesses, "Like all Johnsons, I love to telephone. My trans-Atlantic bills are pretty high."

Last year in Geneva she told Soviet delegate Semyon Tsarapkin that she knew only five words of Russian—"book, pencil, paper, magazine and newspaper."

"Enough for us to sign an agreement!" he quipped.

Diana's relationship with the First Family is better known than that of the other two girls. The MacArthurs were in the pavilion at the President's swearing in and attended his inaugural luncheon in the Capitol. Along with Patsy, they were invited to the Sunday night supper given on the eve of inaugural week by famed hostess Perle Mesta.

"The morning of the swearing in Mrs. Johnson had someone call me to say an extra ticket had turned up," Diana said. "She wanted to know if one of my children would enjoy using it. That kind of thoughtfulness just overwhelms you."

The kinfolk trio are always seeking ways to repay the First Family's hospitality. The Johnsons have been guests at a MacArthur party but have yet to visit Roxanne and Patsy. The two girls enjoy a "Joint hobby" of cooking, often serving a meal of fondue bourgignonne, for which guests use long skewers to cook their own meat in a chafing dish Roxanne brought from Switzerland.

"We hope the Johnsons can come for dinner. Uncle Lyndon would like this fondue," Roxanne said, helping herself to a taste.

10C St. Joseph, Mo., News-Press, Sunday, January 7, 1968 | was nervous," he told them,

BETTY BEALE'S WASHINGTON LETTER

Expert Job by Chuck Robb on Honeymoon Secrecy

Washington, D. C.
Jan. 6, 1968

Dear News-Press Readers:

Chuck Robb shouldn't be heading for an overt war; he should join the covert part of the CIA. He's new to the goldfish bowl life, but he pulled off the greatest coup of any publicized bridegroom in recent memory.

He managed to cloak himself and his bride in a cloud of secrecy that must be the envy of everybody from Jacqueline Kennedy and Princess Margaret to Charles Lindbergh.

Despite reports that they honeymooned at Caneel Bay, V. I., to this day not even the First Lady is sure they did, and she is not the kind to ask. It's a cinch the President doesn't know either because he would be the first to tell, said a White House staffer with a chuckle.

Press Corps Alerted

And Chuck pulled this off at a time when the press corps all the way from the White House to the Caribbean, from Dulles Airport to Honolulu, was alerted to be on the lookout.

Yet not a single camera though equipped with telescopic lens and trained around the clock on the suspected honeymoon spot ever caught visible proof of the newlyweds' arrival, presence or departure. Jackie and Princess Margaret should seek his advice the next time they want to go off swimming somewhere in privacy.

How did he do it? He won't say.

"About 75 per cent of what we saw in print was amusing but not necessarily factual," he said. So the true story may never be known.

Said Lynda, regarding their first stop after leaving the White House, "I didn't know where we were going until we actually got there." Incidentally, they did not spend their wedding night at the Georgetown Inn as definitely stated in one paper.

An Early Riser

Lynda Robb, new Arlington resident, found out what it was like to be the dutiful wife of a marine officer even before she left the White House.

Her husband, she discovered

Ambassador Jimmy Symington, chief of protocol, wowed his audience in the Shoreham Hotel's Blue room when he put on a fund-raising performance. A preview photo shows him with Mrs. Donald MacArthur, the First Lady's niece, and Warren Woodward.

wouldn't tell them when they looked at their social calendars.

The Middle East war, an earthquake and absences from town caused the swingingest diplomatic hostesses, the chatelaines of the Kuwait, Venezuelan, Spanish and Moroccan Embassies, to forego the usual ball on New Year's eve.

And there was even a new trend observed among the debutante set. The withdrawal from the exclusive Washington Debutante Ball of two girls whose parents had already paid $700 each for their participation and could not get their money back, is an indication of it.

Prefer to Travel

More and more prospective debutantes would rather have the money to go to Europe than have a coming out party. A lot would rather spend their vacation time at a ski resort where some of the most attractive stags are going. Many times it's the parents who nostagically are holding onto the traditional custom of presenting their daughters to society.

Even they skipped giving the usual holiday bashes for their contemporaries and spent their time instead keeping tabs on

The Peabodys are now residents of Washington, but she recalled the time she was scheduled to be the main speaker at a B'nai B'rith dinner in Boston and canceled out the same day because her daughter had just come home from school and wanted very much to talk over some things with her mother then and there.

Instead of not forgiving her for the last-minute cancellation, the same group gave Toni Peabody their next "Mother of the Year" award!

• • •

Ambassador Jimmy Symington, the socially impeacable, handsome young chief of protocol, made his professional debut as a singer at the Shoreham Hotel the other evening and was a smash hit.

The hotel's Blue room was packed with a society audience that cried "Fabulous!," "Sensational!," "Encore!" and "More!" when he finally put his guitar down and took a bow.

Guitar Project

The attractive director of the striped pants set, who may next run for Congress from Missouri, was making a one night appearance only to raise money for his pet project—guitar lessons and, if warranted, guitars, for

"and I said 'Why should a col of protochief be nervous?"

Before singing "Shadow of Your Smile," he observed that there were many kinds of smiles.

"There is the kind you get when you call a king 'your royal highness;' or the kind you get when you step on the foot of a president as he is getting out of his car."

• • •

AROUND THE TOWN:

Sen. Joseph Clark's divorced wife of 32 years will marry a Washington socialite realtor in a couple of months. The Pennsylvania legislator who instigated the divorce remarried as soon as it was final.

Noel Clark, daughter of Mrs. William Hall of Louisville, Ky., and Easthampton, L. I., will wed Cuthbert Train, widower and son of the late Adm. and Mrs. Charles Russell Train. He has a post-debutante daughter and three sons. She has one married daughter.

Marjorie Post sent Mrs. Johnson a check for $10,000 made out to the Society for a More Beautiful Capital on Christmas eve. She had given an earlier check for $5,000 for the landscaping of a public school in a poor part of town.

What do you send a woman who has everything? To thank her the First Lady dispatched to the General Foods heiress' palatial residence on Christmas day a basket of homey personal things such as loaves of bread baked at the White House, jars of peach and pear preserve put up at the LBJ Ranch, and a handwritten note.

CIA Director Dick Helms' estranged wife Julia made a recent sale that firmly establishes her as a Washington sculptor of note. Although people were aware of her artistic talents, until last summer she was best known as the wife of the CIA boss because glamorous government jobs get more publicity here than any interpreter of the arts.

Now the Washington Gallery of Art has sold for $3,000 her garden bronze fountain sculpture of a young boy—her own son at a tender age—who is crouching down on a log and looking with beguiling interest at a frog. The purchasers were James Ramsay Hunt and his wife who is sister to the wife of Deputy Secretary of Defense Paul Nitze.

Yours, B. B.

(Distributed 1968, by Publishers-Hall Syndicate)
(All Rights Reserved)

during the two weeks they spent at the Executive Mansion after returning from their honeymoon, got up at 6:30 in the morning on work days.

"I think 8 a. m. is early!" exclaimed the President's daughter who, despite the fact that she was still surrounded by servants, arose in time to fix Chuck a real morning meal.

* * *

Washington had its quietest holiday season in years. A lot of chic people thought they must be slipping socially or had something their best friends

their gallivanting offspring—the reason being, the new morals among the young and the incredible crime on the streets.

Mrs. Endicott Peabody, the attractive wife of the former Governor of Massachusetts, says there would be a lot fewer hippies if parents were always there when their children needed them most.

Received an Award

Children, she thinks, "are desperately looking for someone who cares. And if they don't get the care at home they turn to love-ins and all the other things that go with it."

the neglected poor children of Washington's dreary Junior Village.

"A guitar," said Jimmy, "is something you can treat with tenderness and love, and it gives you back the same." This was something these children need.

Washingtonians who have to go to so many dinners that when they have a night off they stay home—turned out in a large numbers to hear him. And what they heard was a very professional poised young man who interspersed his songs with an amusing patter.

"Doug Cater asked me if I

Campaign reform groups advocate limits to out-of-state individual donations

By Tom Bowman
Washington Bureau of The Sun

WASHINGTON — He might be head of the Maryland Democratic Party, but Nathan Landow likes to help fellow Democrats far from the state's borders.

Mr. Landow and three other family members donated $10,500 — mostly in $1,000 checks — to candidates outside Maryland during the past two years, including contributions to Sen. Sam Nunn, D-Ga., and Sen. Albert Gore, D-Tenn., according to Federal Election Commission records.

Meanwhile, Diana MacArthur, chairman of Dynamac Corp., a Rockville-based consulting and engineering company, spent $7,225 in out-of-state donations.

But those contributions pale in comparison with donations made by Bethesda lobbyist Denis M. Neill and his wife, who gave nearly $62,000 to dozens of congressmen and senators from California to New Jersey during the past two years, according to the FEC.

Such large donations would be sharply curtailed under campaign finance reform legislation being considered in Congress amid growing concern about the influence of wealthy out-of-state contributors in congressional campaigns.

Campaign reform advocates note that public attention has been riveted on the thousands of dollars funneled into campaigns by political action committees. But there has been little attention paid to the spending power of wealthy individuals and families, even though their donations make up the bulk of campaign spending and play an active role in the campaigns of Maryland lawmakers. Large contributors — those whose donations exceed $200 and must be listed on campaign finance reports — contributed 48 percent of all money raised by congressional candidates between 1987 and 1988, according to a study by Citizen Action, a campaign reform group. PACs contributed 30 percent, the group found.

Montgomery County was among the top areas in the nation for large donor campaign contributions, with as much as 89 percent of its donors' money targeted for congressional races outside the state, the study said.

Citizen Action found that large donors are often associated with special interests, particularly business. Unlike PACs, they are not required to register with the FEC.

Although individual donations are limited to $1,000 for each election and a total of $25,000 each year, families often skirt the provision by donating in the names of children and other family members, according to the study.

Large out-of-state donations also show up in the campaign war chests of the Maryland congressional delegation, with the state's two senators collecting the majority of individual donations above $500 from outside Maryland.

The 1986 campaign of Sen. Barbara A. Mikulski, D-Md., picked up $293,608 from outside the state and $202,794 from Maryland donors, according to FEC records. The 1988 re-election campaign of Sen. Paul S. Sarbanes, D-Md., pulled in $294,509 from individuals in other states and $185,145 from his constituents.

Of the $84,978 in individual donations collected in November by Representative Helen Delich Bentley, R-2nd, $21,925 came from outside the state. The FEC reported that her contributions included 13 checks for $1,000 each, many from business executives in the oil and marine industry.

Representative Steny H. Hoyer, D-5th, collected $67,665 in individual contributions in October and November, with $17,000 from outside Maryland. Most of this money was in $1,000 checks from lawyers and consultants, FEC records show.

Ms. Mikulski has scheduled a fund-raising trip to Arizona and California this week with events sponsored by law firms, Asian-American groups and other supporters. She is expected to pick up $10,000 to $20,000 in individual contributions at each event, according to the senator's office.

"It's a growing phenomenon," said Michael Podhorzer of Citizen Action. "It's essentially the same as a PAC contribution, but there's no PAC."

"People think that PACs are bad and individuals are good, but it ain't that way," said Larry Makinson of the Center for Responsive Politics, a non-profit research group that studies Congress and is investigating large individual contributions. "There's a tendency for people to think if you get rid of PACs, you get rid of the problem."

"The higher the [individual donation] limit, the easier it is to get large amounts of money to people you want to influence," Mr. Makinson said.

Mr. Landow brushed aside such talk, saying that individuals and families have a "civic obligation" to donate to candidates. Since lawmakers deal with questions that are "national in scope," contributions from out-of-state donors should not be curtailed.

"I don't think it's a good idea to limit [individual donations]," he added. "I agree with limitations on PACs." He doubted that any such contributions from families could be equated with PACs and said his own relationship with the candidates is "personal."

"Those I like and believe in, I support," he said.

Ms. MacArthur said she donates to politicians, primarily Democrats, "because I admire them."

"I think $1,000 is just a fine upper limit," she said.

Asked if she thought large donors wield undue influence, she said, "I don't have any opinion on that."

A Senate Democratic measure calls for voluntary spending limits and public financing that encourages individual contributions of $250 or less, with half coming from inside a candidate's state. A similar measure passed the Senate last year, supported by Mr. Sarbanes and Ms. Mikulski, but reached a stalemate with competing House legislation.

Another measure from Sen. John Kerry, D-Mass., would provide public financing to a candidate who collects individual contributions in amounts of $250 or less, with at least 55 percent from in-state donors.

Senate Minority Leader Robert Dole, R-Kan., advocates reducing the limit on individual donations from $1,000 to $500 to an out-of-state congressional campaign.

In the House, Representative Mike Synar, D-Okla., calls for reducing all individual contributions — inside or outside the state — to $500, "recognizing that money is interested whether it comes from PACs or individuals."

But Mr. Podhorzer said that decreasing the amount of money an individual can give will not dilute the spending power of wealthy contributors.

"They're going to find ways to give," he said. "They just have to go to a lot more trouble." Citizen Action believes public financing of campaigns is the only solution. The group supports the Kerry bill because it proposes the greatest amount of public financing.

Mr. Hoyer did not return phone calls.

Mrs. Bentley downplayed the money she received from contributors outside Maryland, saying, "I've never had a request from them for anything."

The congresswoman last year backed a failed Republican reform measure requiring that required that at least half of all donations come from constituents. But she declined to say whether the current $1,000 limit on individual contributions should be reduced for those outside Maryland.

"When I see the whole picture on reform, then I'll give you an answer," she said.

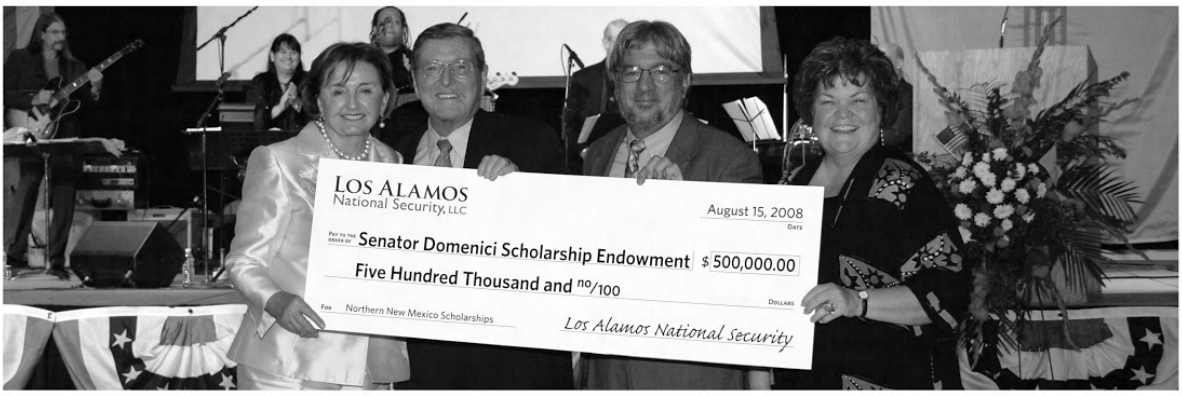
Los Alamos National Laboratory Foundation Thanks the Sponsors of its 12th Annual Banquet

In Honor of Senator Pete Domenici and In Support of the Los Alamos Employees' Scholarship Fund



Diamond Sponsor, Los Alamos National Security, LLC presents a check to the Senator Pete Domenici Endowed Scholarship Fund. (Left to right) Diana MacArthur, President, LANL Foundation Board of Directors; Senator Pete Domenici; Mike Anastasio, Director, LANL; and Susan Herrera, Chief Executive Officer, LANL Foundation.

Platinum Sponsors

Penny Britt; Doug Britt, President, Dynamac Corporation; Diana MacArthur, Chief Executive Officer, Dynamac Corporation; and Senator Domenici.

Steve Wells, Chief Executive Officer, Los Alamos National Bank.

Felicia Aguilar, Los Alamos Operations Manager, LATA.

Gold Sponsors

Bill Press and Jeffrey Howell, Immediate Past President, LANL Foundation Board.

It is important for friends and communities to gather together and celebrate our achievements and recognize the hope and promise of the future. On August 15, 2008, the LANL Foundation and its supporters joined in honoring Senator Pete Domenici for his 36 outstanding years of public service to New Mexico and the Nation.

In 2008, the LANL Foundation established the Senator Pete Domenici Endowed Scholarship Fund. In "Pete's spirit," this fund is dedicated to providing college scholarships to Northern New Mexico seniors who exhibit academic excellence and outstanding leadership in their schools and communities. Through gifts from the corporate and private sector, as well as proceeds raised from the 12th Annual Banquet, the LANL Foundation hopes to endow a $10,000 scholarship (four-year $2,500 award) annually in each of the seven Northern New Mexico counties served by the Foundation. This fund is also dedicated to fostering the competitiveness of New Mexico's workforce in an increasingly complex global economy. We hope Senator Domenici's legacy will continue to live on through the lives of outstanding students as they pursue their own quest for excellence.

2013 - Passing of first husband

https://www.washingtonpost.com/local/obituaries/nikolai-tschursin-former-translator-at-the-library-of-congress-dies-at-86/2012/02/07/gIQA9ywB2Q_story.html

Nikolai Tschursin, former translator at the Library of Congress, dies at 86

Nikolai Tschursin, 86, a Russian native who did translation work for the Library of Congress until retiring in 1989, died Jan. 31 at his home in Bradenton, Fla. He had congestive heart failure.

The death was confirmed by his daughter Anna Tschursin.

Mr. Tschursin translated military documents from Russian into English at the Library of Congress, which he joined in the mid-1970s. Earlier, he was an engineer at the Army Department's Harry Diamond Laboratories.

Nikolai Tschursin was born in Rostov, Russia. He settled in the United States after World War II and became a U.S. citizen in 1952. He was a Marine Corps veteran of the Korean War and a 1966 engineering graduate of George Washington University.

He moved to Florida from Vienna in 1998. He was a past member of the Russian Orthodox Cathedral of St. John the Baptist in the District.

His first marriage, to Diana Taylor, ended in divorce. Their daughter, Elizabeth Tschursin, died in 1994.

Survivors include his wife of 51 years, Galina Losinski-Kovanko of Bradenton; a son from his first marriage, Alexander Tschursin of Santa Fe, N.M.; two daughters from his second marriage, Anna Tschursin of Stafford, Va., and Ludmila Tschursin of Folsom, Calif.; and five grandchildren.

2013

BY ROBIN MARTIN THE NEW MEXICAN

At age 80, when most people are at home relaxing, Santa Fe native Diana MacArthur is planning a three-week trip to northern Pakistan, where she is building a school.

Her goal is to complete construction on a 23,000-square-foot building for students in nursery school through eighth grade by the end of 2015. MacArthur and her friends and family have donated half of the funds for the $5 million project.

The school in the village of Murtaza Abad in the Hunza Valley is being built in memory of MacArthur's daughter, Elizabeth "Leeza" Tschursin.

MacArthur said people ask why she is building a school so far away. Her answer is that her daughter chose the site.

Tschursin, who was born in 1955, was MacArthur's oldest child. She lived in Washington, D.C., but spent much time in Santa Fe, staying with family and hiking in the Pecos Wilderness. She received her bachelor's degree from the College of Santa Fe, a master's degree in biology from Georgetown University and a doctorate in microbiology from George Washington University.

As a graduation present, Tschursin's mother gave her a trip to climb in the Alps, on Mount Kilimanjaro and in the Himalayas. Because of political turmoil, Tschursin was not able to enter Nepal, so she went to Pakistan, where she ended up in the country's northernmost territory, Gilgit-Baltistan. As she traveled on the Karakoram Highway, she passed through a village and saw a small school, the Al-Murtaza Academy, which taught children up to sixth grade. She fell in love with the place, stayed with the principal's mother and taught science.

Tschursin made many friends in the Hunza Valley, and when her visa ran out, she was invited to come back to teach. But she became ill and died in Washington, D.C., in 1994 before she was able to return.

MacArthur wants to turn the small school into an academic center for excellence. It also will be a state-of-the-art building.

Pakistani architects have been hired to make the new school the safest building in an area that has severe earthquakes. The project also has backup architects and engineers based in Albuquerque.

Today, the school is a shack with no insulation, lights or ventilation. The new building will have central heating, insulated walls and windows, and energy-saving light fixtures.

Power will come from the local electric grid, and diesel and methane gas from animal waste will fuel boilers to heat the building. Solar and wind power generation is impossible in the valley because tall mountains block both the sun and the wind.

The school will eventually serve

In reading the newspapers in Marshall Texas, there seems to be a lot of coming and going to Guatemala and Honduras, presumably to the United Fruit locations. In Passenger lists to these locations has turned up a lot of information. Various family trees will be listed below but the name connections are really amazing:

- There were tons of Taylors and Johnsons in this area. Some had been there for over 50 years, and some had arrived from England more recently. None of the English had naturalization papers which are frequent the more north you go at this time period.
- The Sibley's travelled from Jamaica to America and England frequently and many offspring lived in America and claimed citizenship, but there are never any naturalization papers.
- Diana Taylor MacArthur's sister, Gerry, married Jack Cruz Hopkins. The founder of United Fruit, Lorenzo Dow Baker, married a Hopkins. These Hopkins were mormons via Utah, via Washington State, via Missouri, and unknown before that.
- Dr. Steele's first wife was a Jessica Booth. One of their children was named Junius. The only other person I've seen by that name is Junius Brutus Booth, brother of John Wilkes Booth. Jessica Booth's. sister married a Bagely.
- A pallbearer at Julia Elizabeth Steele's funeral was a Dr. Ford.
- There is no marriage record for Julia Elizabeth Steele and Antonio Jefferson Taylor, nor a birth record for the oldest daughter Gerry Hopkins.
- Antonio and Lady Bird Johnson were born in Karnack, Texas, a town distinct from Marshall. Newspaper clippings show that their father was not Thomas Jefferson Taylor as many presume. He was their guardian, so presumably a relative of the parents. There are no birth records for them either.
- The popular opinion is Lady Bird Johnson's "mother's" maiden name was Vigil or Padillo, when various records show it was Vogel. It could be possible these were her maiden names, and she and her brother adopted Thomas Jefferson Taylor's surname. Things seem to be intentionally obtuse.
- The was a Mr. Taylor in Marshall around 1917 who was a bird expert. He gave many lectures and the newspapers called him bird man. Perhaps this is where we get Lady Bird.
- There is a Christopher David Steele born in Dallas in 1962. Given the movement back and forth to England (Fiona Hill, Voyovich), perhaps its not unreasonable to believe the British spy of the Russian dossier is really an American by birth. George Webb states he was married in Washington DC.

[...]

William Brockenbrough "Bill" Taylor Jr. (born 1947) is an American diplomat and a former United States ambassador to Ukraine. In June 2019 Taylor returned to Ukraine to serve as the chargé d'affaires for Ukraine.

Background

Taylor is the son of Nancy Dare (Aitcheson) and [**William Brockenbrough Taylor Sr (born 1925)**], who had been a director of research and development for the United States Army Corps of Engineers (USACE).

Like his father, he attended the United States Military Academy at West Point, New York, graduating in 1969, in the top 1% of his class. The Howitzer yearbook describes his modesty about his many academic and athletic accomplishments, describing him as "a man who is held in the highest esteem and admiration by all of us."[5] In 1977 he completed graduate studies at Harvard University's John F. Kennedy School of Government, receiving a Master of Public Policy degree.

Career

After Taylor graduated from West Point, he served in the infantry for six years, including tours of duty in the 82nd Airborne Division at Fort Bragg, and the 101st Airborne Division in Vietnam during the War. He commanded a company in the 101st Division, and received a Bronze Star and Air Medal V for heroism. Later, he was an aero-rifle commander in the 2nd United States Cavalry Regiment,[6] defending NATO in Germany across the border of Czechoslovakia controlled by the Warsaw Pact and the Eastern Bloc including several countries that had been invaded and occupied by USSR during World War II.[6]

As a civilian he served as Director of Emergency Preparedness Policy in the Department of Energy before serving for five years as Legislative Assistant on the staff of U.S. Senator Bill Bradley (D-N.J.). He then directed a Defense Department think tank at Fort Lesley J. McNair. Following that assignment, he transferred to Brussels for a five year assignment as the Special Deputy Defense Advisor to the U.S. Ambassador to NATO, William Howard Taft IV. From 1992 until 2002 Taylor served with the rank of ambassador coordinating assistance to Eastern Europe and the former Soviet Union, followed by an assignment in Kabul coordinating U.S. and international assistance to Afghanistan. In 2004 he was transferred to Baghdad as Director of the Iraq Reconstruction Management Office.[7]

Until 2006 he then was the U.S. Government's representative to the Quartet's effort to facilitate the Israeli disengagement from Gaza and parts of the West Bank, led by Special Envoy James Wolfensohn in Jerusalem. The Quartet Special Envoy was responsible for the economic aspects of this disengagement.

Taylor was confirmed as United States ambassador to Ukraine by the U.S. Senate on May 26, 2006, and was sworn in on June 5, 2006; he held the post till May 2009.[2]

On September 30, 2009, U.S. President Barack Obama nominated John Tefft as U.S. ambassador to Ukraine.[8] Taylor was appointed Special Coordinator for Middle East Transitions in September 2011.[9]

In 2015, Taylor was appointed executive vice president of the United States Institute of Peace after serving a year in the same role in an acting capacity.[10][11]

Taylor became chargé d'affaires *ad interim* for Ukraine in June 2019, taking over the role from the deputy chief of mission, Kristina Kvien, after Marie Yovanovitch departed Ukraine.[12]

Trump–Ukraine scandal

Main article: Trump–Ukraine scandal [...]

Taylor–Sondland texts

Taylor arrived in Ukraine a month after the abrupt ousting of Ambassador Yovanovitch and the inauguration of the country's new president Volodymyr Zelensky. But following President Donald Trump's phone call with the new Ukranian president, Taylor questioned Trump's motivation in a text to Gordon Sondland, the United States Ambassador to the European Union: "Are we now saying that security assistance and WH meeting are conditioned on investigations?" Sondland told him to phone.[13]

On October 3, 2019, it was revealed that Taylor had expressed, in text messages, concern that President Trump may have withheld aid to Ukraine unless they investigated corruption in Ukraine and interference in the 2016 US election. According to transcripts released by the house impeachment probe, Taylor on September 9, 2019, at 12:47:11 AM texted, "I think it's crazy to withhold security assistance for help with a political campaign." On October 22, 2019 Taylor's opening statement also explained that Sondland required that Zelensky make public statements announcing an investigation, forcing him to conduct one, before the US released the allocated military aid. Taylor said he feared that Trump would withhold the military aid anyway, handing Moscow everything it wanted from the betrayal, texting Sondland that his "nightmare is that they [the Ukrainians] give the interview and don't get the security assistance. The Russians love it. (And I quit.)."[14][15]

Over four hours later, at 5:19:35 AM,[16] in his response to Taylor, Gordon Sondland, the United States Ambassador to the European Union, responded that the charge is "incorrect." "Bill, I believe you are incorrect about President Trump's intentions. The President has been crystal clear: no quid pro quo's of any kind. The President is trying to evaluate whether Ukraine is truly going to adopt the transparency and reforms that President Zelensky promised during his campaign."[16] He then suggested Taylor call the Executive Secretary of the United States Department of State about any concerns[17]: "I suggest we stop the back and forth by text If you still have concerns I recommend you give Lisa Kenna or S a call to discuss them directly. Thanks."[18] In his testimony during the impeachment inquiry Sondland noted that it was only out of his deep respect for Taylor that he tried to address Taylor's concerns.[19] Taylor gave a deposition before a closed-door session of the House Intelligence Committee on October 22, 2019.[20]

Testimony in House impeachment inquiry

Opening statement of Ambassador William B. Taylor

On October 22, 2019, Taylor testified before the US Congressional House regarding the impeachment inquiry against Donald Trump and the Trump-Ukraine scandal in a closed session. Taylor's opening statement was made public and directly implicated President Trump in a proactive and coordinated effort to solicit a political *quid pro quo* whereby “everything” - from a one on one meeting with President Trump to $400 million in military aid to Ukraine - would be held up unless Ukrainian President Zelenskyy agreed to announce publicly that “investigations” would be launched including into former VP Joe Biden, his son Hunter Biden, Burisma, and Ukraine's alleged involvement in the 2016 election. Taylor’s opening statement and testimony was widely viewed as an inflection point in the impeachment inquiry.[21][22][23][24]

Personal

Taylor is married to Deborah Ann Furlan;[25] and they have two children. His nephew (sister's son) is actor and comedian Zach Cregger.

John P. Tazewell : September 25, 1920 - May 31, 2016

Resided in Virginia Beach, VA

John Parks Tazewell, 95, passed away on May 31, 2016, at Westminster-Canterbury in Virginia Beach, Virginia. He was born on September 25, 1920, in Wilmington, Delaware, to Calvert Walke Tazewell and Sophie Goode Tazewell.

*John grew up in Norfolk, Virginia, and graduated from Maury High School in 1939. After high school, he attended the U.S. Naval Academy and graduated in 1942. During World War II, he served on the destroyer **USS O'Bannon (DD-450)** , and battleships U.S.S. Alabama and U.S.S. West Virginia, and was awarded a Bronze Star (V). After the war, he attended the Navy Post Graduate School and Massachusetts Institute of Technology, where he received a Masters of Science in Electrical Engineering. He also served as Commodore of a destroyer division, which included NATO-manned U.S.S. Claude V. Ricketts, Commander of the destroyer U.S.S. Laffey, Commander of the Norfolk Test and Evaluation Detachment, project officer for the Tartar missile program, and program manager of the Aegis missile area defense system. He retired in 1970, at the rank of Captain.*

After retirement, John volunteered with a number of organizations in Norfolk, Virginia, including the Senior Services of Southeastern Virginia (formerly SEVAMP), Chrysler Museum Library and Lee's Friends. He enjoyed sailing, rowing, traveling and visiting his children and grand children with his wife and best friend, Elizabeth "Betsy" Taylor.

A memorial service will be held 2:00 p.m., Saturday, August 27, 2016 at Westminster Canterbury, Virginia Beach. A reception will follow the service. A private ceremony to scatter John's ashes will follow in Norfolk.

Notes:

- ***From "Gordon Lilly" :** John was a cousin of my wife, Jean, but I had only met him twice before we moved to Westminster Canterbury six years ago. I then decided to take the liberty of searching for him on the web. I found the most fascinating entry. It was an account to the party that was thrown for him by his crew on the occasion of his retirement. It was clear that he had been a remarkable officer earning the utmost affectionate respect from his ship's company. This prepared me for getting to know John and his family. I got to know him for his intelligence and keen wit. I got to see him as the most loyal husband of Betsy whom he cared for so diligently in her declining years. I had the pleasure of getting to know his delightful family. It was a great privilege for me to become his friend.*
- ***Luong and Lang Vu - 3 years ago :** We missed John and Betsy very much, they helped us many things, when we came Norfolk 1975, we never forget it, we will be in for their memorial service on August 27. We shared the bad news with John, Richard, Judith, Littleton. Will see you all. Luong Vu and all our family.*
- ***Jane and Dwight Schaubach / Jane Schaubach - 3 years ago :** To the family of John, sorry for your loss. John had a life well lived. He and Betsy were our neighbors on Oak Grove Rd. Not too many of our neighbors of that era left. It was a great time to live in Talbot Park.*

Institutions

University of Wisconsin–Madison

Thesis

The interaction of Rous sarcoma virus and cells in vitro (1960)

Influenced

Wei-Shau Hu

Howard Martin Temin (December 10, 1934 – February 9, 1994) was a US geneticist and virologist. He discovered reverse transcriptase in the 1970s[2] at the University of Wisconsin–Madison, for which he shared the 1975 Nobel Prize in Physiology or Medicine with Renato Dulbecco and David Baltimore.[3][4]

[...]

Early life and education[edit]

Temin was born in Philadelphia, Pennsylvania, to Jewish parents, Annette (Lehman), an activist, and Henry Temin, an attorney.[5] As a high school student at Central High School in Philadelphia, he participated in the Jackson Laboratory's Summer Student Program in Bar Harbor, Maine. The director of the program, C.C. Little, told his parents that Temin was "unquestionably the finest scientist of the fifty-seven students who have attended the program since the beginning…I can't help but feel this boy is destined to become a really great man in the field of science."[5] Temin said that his experience at Jackson's Laboratory is what really got him interested in science.[6]

Temin's parents raised their family to have values associated with social justice and independent thinking, which was evident throughout his life. For Temin's bar mitzvah, the family donated money that would have been spent on the party, to a local camp for displaced persons. Temin was also the valedictorian of his class and he devoted his speech to relevant issues at the time including the recent hydrogen bomb activity and the news of sending a man to the moon.[5]

Temin received his bachelor's degree from Swarthmore College in 1955 majoring and minoring in biology in the honors program. He received his doctorate degree in animal virology from the California Institute of Technology in 1959.[6]

Career and research[edit]

Temin's first exposure to experimental science was during his time at the California Institute of Technology as a graduate student in laboratory of Professor Renato Dulbecco.[6] Temin originally studied embryology at Caltech, but after about a year and a half, he switched to animal virology. He became interested Dulbecco's lab after a chance run-in with Harry Rubin, a postdoctoral fellow in Dulbecco's lab. In the lab, Temin studied the Rous sarcoma virus, a tumor-causing virus that infects chickens.[5] During his research on the virus, he observed that mutations in the virus yielded alterations in the structural characteristics of the infected cell – thus, integration into the cell's genome was occurring. As part of his doctoral thesis, Temin stated that the Rous Sarcoma Virus has "some kind of close relationship with the genome of the infected cell".[5] Following receiving his doctorate, Temin continued to work in Dulbecco's lab as a postdoctoral fellow.

In 1960, the McArdle Laboratory for Cancer Research at the University of Wisconsin–Madison recruited Temin as a virologist; a position that had been hard to fill because, at the time, virology was not considered pertinent to cancer research. Even though Temin knew he would be completely independent in Madison, because of the lack of research involving virology and oncology together, Temin stated that he was "supremely self-confident".[6] When he first arrived in Madison in 1960, he found an unprepared laboratory in the basement of a rundown building with an office that could be considered a closet. Until a more suitable laboratory could be prepared, he continued his research with RSV at a friend's laboratory at the University of Illinois. Later that year, he returned to Madison, continued his RSV research in his own lab, and began his position as an assistant professor.[6]

While studying the Rous sarcoma virus at UW-Madison, Temin began to refer to the genetic material that the virus introduced to the cells, the "provirus". Using the antibiotic, actinomycin D, which inhibits the expression of DNA, he determined that the provirus was DNA or was located on the cell's DNA.[7][8][9] These results implied that the infecting Rous sarcoma virus was somehow generating complementary double-stranded DNA. Temin's description of how tumor viruses act on the genetic material of the cell through reverse transcription was revolutionary. This upset the widely held belief at the time of a popularized version of the "Central Dogma" of molecular biology posited by Nobel laureate Francis Crick, one of the co-discoverers of the structure of DNA (along with James Watson and Rosalind Franklin). Crick had claimed only that sequence information cannot flow out of protein into DNA or RNA, but he was commonly interpreted as saying that information flows exclusively from DNA to RNA to protein. Many highly respected scientists disregarded his work and declared it impossible. Despite the lack of support from the scientific community, Temin continued to search for evidence to support his idea. In 1969, Temin and a postdoctoral fellow, Satoshi Mizutani, began searching for the enzyme that was responsible for the phenomenon of viral RNA being transferred into proviral DNA.[5] Later that year, Temin showed that certain tumor viruses carried the enzymatic ability to reverse the flow of information from RNA back to DNA using reverse transcriptase. Reverse transcriptase was also independently and simultaneously discovered in association with the murine leukemia virus by David Baltimore at the Massachusetts Institute of Technology.[10] In 1975, Baltimore and Temin shared the Nobel Prize of Physiology or Medicine.[11] Both scientists completed their initial work with RNA-dependent DNA polymerase with the Rous sarcoma virus

[11] Both scientists completed their initial work with RNA-dependent DNA polymerase with the Rous sarcoma virus.

The discovery of reverse transcriptase is one of the most important of the modern era of medicine, as reverse transcriptase is the central enzyme in several widespread viral diseases such as AIDS and Hepatitis B. Reverse transcriptase is also an important component of several important techniques in molecular biology, such as the reverse transcription polymerase chain reaction, and diagnostic medicine.

Awards and honors[edit]

In 1992 Temin received the National Medal of Science. Temin was elected a Foreign Member of the Royal Society (ForMemRS) in 1988.[1][12]

Following winning the Nobel Prize, Temin focused his research mainly on studying the viral sequences that control the packaging of viral RNA, developing a new vaccine for HIV, and studying the mechanisms of retroviral variation.[6]

Life and career post-Nobel Prize[edit]

After receiving the Nobel Prize in 1975, Temin went from a rebel in the scientific community to a highly respected researcher. Temin began receiving international recognition for his work, and used his newly acquired fame to improve the world. An example of this was in October 1976; Temin helped scientists in the Soviet Union that were targeted by the KGB, the secret police in the Soviet Union. The Jewish Soviet scientists had been stripped of their jobs and oppressed after requesting visas to emigrate to Israel. Temin made it his mission to personally visit the scientists and their families. He gave them gifts that could be resold to help them financially, and he gave the scientists copies of scientific journals, which had been banned by the KGB.[13] On one occasion, Howard Temin gave a lecture to some of the Jewish Soviet scientists in someone's home. The next morning, almost all of scientists that had attended the lecture were arrested. After they were released, Temin tape-recorded one of the scientist's account of the event and gave the tape to newspapers in the United States so that the situation that Jewish scientists were facing would be publicized.[5]

Another example of Temin trying to improve the world was at the Nobel Prize reception. After receiving the Nobel Prize from King Carl Gustav of Sweden; Temin addressed the smokers in the audience, which included the Queen of Denmark, saying he was "outraged that one major measure available to prevent much cancer, namely the cessation of smoking, had not been more widely adopted". He had also insisted that the ashtray located on the laureates' table be removed.[5]

After winning the Nobel Prize, Temin also became more active in the scientific community outside of research. He was involved in over 14 scientific journals. In 1979, he became an advisory member for the director of the National Institute of Health (NIH) and a member of the human gene therapy subgroup of the recombinant DNA advisory committee. He was also a member of the National Cancer Advisory Board, and the chairman of the AIDS subcommittee. At the National Institute of Allergy and Infectious Diseases (NIAID), he was the chairman of a genetic variation advisory panel on the development of AIDS, and was a member of vaccine advisory board. In the National Academy of Sciences (NAS), he was a member of the Waksman Award committee and report review committee. In 1986, Temin became a member of the Institute of Medicine (IOM)/NAS committee for national strategy for public policy issues associated with AIDS. The last committee Temin served on was the World Health Organization Advisory Council.[6]

In 1981, Temin became a founding member of the World Cultural Council.[14]

Death and legacy[edit]

Temin taught and conducted research at UW-Madison until he died of lung cancer, on February 9, 1994.[1] He was survived by his wife Rayla, a geneticist at UW-Madison, two daughters, and two brothers, Peter Temin, also an academic, and Michael Temin, a lawyer.

Purchased by ATK Launch Systems Group

Founded

December 5, 1929

Defunct

2007, succeeded by Orbital ATK; and later merged with Northrop Grumman

Headquarters

Ogden, Utah, US

Products

Rocket engines, Snowcats

Number of employees

15,000

Parent

Cordant Technologies

Thiokol (variously **Thiokol Chemical Corporation**, **Morton-Thiokol Inc.**, **Cordant Technologies Inc.**, **Thiokol Propulsion**, **AIC Group**, **ATK Thiokol**, **ATK Launch Systems Group**; finally **Orbital ATK** before becoming part of Northrop Grumman) was an American corporation concerned initially with rubber and related chemicals, and later with rocket and missile propulsion systems. Its name is a portmanteau of the Greek words for sulfur (θεῖον *"theion"*) and glue (κόλλα *"kolla"*), an allusion to the company's initial product, Thiokol polymer.

The Thiokol Chemical Company was founded in 1929. Its initial business was a range of synthetic rubber and polymer sealants. Thiokol was a major supplier of liquid polymer sealants during World War II. When scientists at the Jet Propulsion Laboratory discovered that Thiokol's polymers made ideal binders for solid rocket fuels, Thiokol moved into the new field, opening laboratories at Elkton, Maryland, and later production facilities at Elkton and at Redstone Arsenal in Huntsville, Alabama. Huntsville produced the XM33 Pollux, TX-18 Falcon, and TX-135 Nike-Zeus systems. It closed in 1996. In the mid-1950s the company bought extensive lands in Utah for its rocket test range. In 1986 it was found at fault for the Space Shuttle *Challenger* disaster.[1] Thiokol continues to have major operations in the state, at Magna, Wasatch County, and Promontory (manufacturer of the Space Shuttle's solid rocket motors), and its current headquarters at Brigham City. As of 2005 the company employed over 15,000 people worldwide and records annual sales of around US$840 million.

Company history[edit]

Model 601 U.S.A.F. Thiokol Snowcat

Thiokol Spryte used for winter service

- 1926: Two chemists, Joseph C. Patrick and Nathan Mnookin, were trying to invent an inexpensive antifreeze. In the course of an experiment involving ethylene dichloride and sodium polysulfide, they created a gum whose outstanding characteristic was a terrible odor.[2] The substance clogged a sink in the laboratory, and none of the solvents used to remove it were successful. Then the frustrated chemists realized that the resistance of the material to any kind of solvent was a useful property. They had invented a synthetic rubber, which they christened "Thiokol".[3]
- 1929: Bevis Longstreth, an executive at a salt company, founds the Thiokol Corporation in Trenton, New Jersey. He becomes its president and general manager.[4]
- 1944: Longstreth dies, leaving the position of president and general manager open. William Crosby becomes general manager.[4]
- 1945: Charles Bartley, working for the nascent Jet Propulsion Laboratory, discovers the use of thiokol as a stabilizer in solid-fuel rockets.[5]
- 1948: Elkton, Maryland, plant opens, producing solid rocket motors.[6]
- 1949: Thiokol produces the TX-18 Falcon missile, the world's first solid-fueled missile system.[*citation needed*]
- 1957: In anticipation of the forthcoming Minuteman contract, the company builds its plant at Brigham City, Utah.
- 1957: Thiokol Huntsville builds XM33 Pollux missile.
- 1958: Thiokol merges with Reaction Motors Inc. (RMI), makers of liquid propellant rocket motor systems.
- 1958: Thiokol receives contract to build the TU-122 rocket motor for the first stage of the LGM-30 Minuteman ICBM system.
- 1959: Thiokol Huntsville produces CASTOR strap-on booster rocket, used on the Atlas rocket.
- 1964: Woodbine, Georgia plant is constructed to build solid propellant motors for NASA, but the agency changes course and uses liquid fuel.[7]
- 1969: Thiokol awarded U.S. Army contract to manufacture 750,000 Tripflares for use in the Vietnam War.[7]
- 1971: Explosion in magnesium flare assembly facility at Woodbine plant kills 29 and injures 50.[7]
- 1974: Thiokol wins the contract to build the solid rocket booster (SRB) for the Space Shuttle (Nov 29, 1973).
- 1975: Thiokol succeeds Sperry Rand as operator of the large Louisiana Army Ammunition Plant near Minden, Louisiana.
- 1978: The company sells its ski lift division to CTEC and its snow equipment division to Logan Manufacturing Company (LMC), owned by John DeLorean.
- 1980: Thiokol acquires Carlisle Chemical Company of Cincinnati, Ohio.
- 1982: Thiokol merges with Morton-Norwich products (owners of the Morton Salt concern, the Simoniz automotive products brand, and various chemical concerns). The merged company is called Morton Thiokol Incorporated (MTI).
- 1986: An O-ring fault in an MTI SRB destroys Space Shuttle *Challenger* in flight. The company was found at fault for the destruction of *Challenger* and deaths of the astronauts, as a direct causality from pressure from NASA to launch, based on inconclusive evidence of O-ring failure, while under freezing temperatures. (see Space Shuttle Challenger disaster).

A Trident II (D-5) FBM launches and fires its Thiokol solid rocket first stage.

- 1989: Morton Thiokol splits, with most of the chemical concern going with Morton. The propulsion systems division becomes Thiokol Inc.
- 1998: Thiokol changes name to Cordant Technologies.
- 1998: Thiokol branded polymer products purchased by PolySpec L.P., a Houston-based manufacturer of industrial coatings, marine decking, and subsea insulation products.
- 2000: Thiokol merges with two divisions of Alcoa and with Howmet Castings and Huck Fasteners to become AIC Group (Alcoa Industrial Components).
- 2001: Alliant Techsystems (ATK) Inc. (a company formed when Honeywell spun off its defense division) spends $2.9 billion buying Thiokol and related businesses from AIC/Alcoa. ATK built the third stage of the Trident missile and had earlier bought Hercules Aerospace Co., builder of the second stage. With the purchase of Thiokol, makers of the missile's first stage, ATK controls the lion's share of the US solid rocket-fuel market.
- 2005: ATK-Thiokol wins the contract to produce the Ares I launch vehicle first stage for NASA's Project Constellation.[8]

- 2006: Alliant Techsystems (ATK) Inc. renamed ATK-Thiokol to ATK Launch Systems Group.
- 2014: Orbital ATK is formed from the merger of Orbital Sciences Corporation and parts of Alliant Techsystems.
- 2018: Orbital ATK is purchased by Northrop Grumman.

Products[edit]

Thiokol gas generators were used in the airbags on Mars Pathfinder. The top photo shows a complete airbag assembly under test, the bottom shows the three titanium Thiokol gas generators used to inflate the airbags.

Products made by the aerospace divisions of RMI and Thiokol include motors used in Subroc, the Pershing missile, the Peacekeeper missile, Poseidon missile, Minuteman missile, and the Trident I and Trident II missiles. Thiokol produces powerplants for numerous U.S. military missile systems, including AIM-9 Sidewinder, AGM-88 HARM, AGM-65 Maverick, AGM-69 SRAM, and AIR-2 Genie.

Thiokol also produced a variety of liquid and solid rocket motors for the US space program, including deorbit motors for the Mercury and Gemini programs, rocket stages and separation rocket motors for the Apollo program, motors for the Pioneer, Surveyor, Viking, Voyager, and Magellan missions, updated CASTOR boosters for the Delta rocket, and the Space Shuttle Solid Rocket Booster. Reaction Motors powerplants propelled the X-1 and X-15 aircraft, and later Thiokol technologies were also used in the private Tier One manned spaceplane. On March 1, 2006, NASA announced that Thiokol will be the prime contractor for the new Crew Launch Vehicle (CLV), to be known as the Ares I, which will put the Orion spacecraft (formerly known as the "Crew Exploration Vehicle") into low earth orbit, along with the five-segment SRBs for the heavy-lift Cargo Launch Vehicle (CaLV), known as the Ares V.

In addition to ski lifts, Thiokol produced a range of equipment for ski resorts including snowcats and snow grooming vehicles. These businesses were spun off in 1978 when the company restructured itself to concentrate on its rocket products and related technologies. John Z. DeLorean purchased the Thiokol snowcat operation and renamed it DMC. DMC continued to manufacture snowcats until 1988, when the company was renamed LMC. LMC continued making snowcats for 12 more years but ceased operations in 2000. Thiokol produced snow vehicles with a wide range of capabilities and duties. The company also produced several utility based vehicles based on their snowcat tracked vehicle, in addition to larger snow grooming machines suitable for use on steep ski-slopes. Thiokol machines were used in ski resorts, operated by the USAF in Alaska and other northern regions, and are now popular with private owners as dependable snowcats and for all-terrain transport.

Amphibious Thiokol Swamp Spryte All Terrain Vehicle

Thiokol pioneered the short-burn rocket motors used in aircraft ejection seats. The company also produced a number of the earliest practical airbag systems, building the high-speed sodium azide exothermic gas generators used to inflate the bags. Thiokol bags were first used in U.S. military aircraft, before being adapted to space exploration (Mars Pathfinder bounced down on Mars on Thiokol airbags) and automotive airbags. Thiokol's generators form the core of more than 60% of airbags sold worldwide.

Edward Donnall "Don" Thomas (March 15, 1920 – October 20, 2012)[1] was an American physician, professor emeritus at the University of Washington, and director emeritus of the clinical research division at the Fred Hutchinson Cancer Research Center. In 1990 he shared the Nobel Prize in Physiology or Medicine with Joseph E. Murray for the development of cell and organ transplantation. Thomas and his wife and research partner Dottie Thomas developed bone marrow transplantation as a treatment for leukemia.[2]

Biography[edit]

Born in Mart, Texas, Thomas often shadowed his father who was a general practice doctor. Later, he attended the University of Texas at Austin where he studied chemistry and chemical engineering, graduating with a B.A. in 1941 and an M. A. in 1943. While Thomas was an undergraduate he met his wife, Dorothy (Dottie) Martin while she was training to be journalist. They had three children. Thomas entered Harvard Medical School in 1943, receiving an M.D. in 1946. Dottie became a lab technician during this time to support the family, and the pair worked closely thereafter. He did his residency at Peter Bent Brigham Hospital before joining the US Army. "In 1955, he was appointed physician in chief at the Mary Imogene Bassett Hospital, now Bassett Medical Center, in Cooperstown, N.Y., an affiliate of Columbia University." [3]

At Mary Imogene Bassett, he began to study rodents that received lethal doses of radiation who were then saved by an infusion of marrow cells. At the time, patients who underwent bone marrow transplantation all died from infections or immune reactions that weren't seen in the rodent studies. Thomas began to use dogs as a model system. In 1963, he moved his lab to the United States Public Health Service in Seattle.[4]

Thomas also received National Medal of Science in 1990. In 2003 he was one of 22 Nobel laureates who signed the Humanist Manifesto.[5]

He died of heart failure and is survived by his three children.[4] His wife Dottie died in 2015 aged 92.

Awards and honors[edit]

- 1965-1969 Hematology Study Section, National Institutes of Health
- 1969-1973 Member, Board of Trustees and Medical and Scientific Advisory Committee, Leukemia Society of America, Inc.
- 1970-1974 Clinical Cancer Investigation Review Committee, National Cancer Institute
- 1974 First Annual Eugene C. Eppinger Lecture at Peter Bent Brigham Hospital and the Harvard Medical School
- 1975 A. Ross McIntyre Award, University of Nebraska Medical Center
- 1975 The Henry M. Stratton Lecture, American Society of Hematology, Dallas
- 1977 The Lilly Lecture, Royal College of Physicians, London
- 1979 The Philip Levine Award, American Society of Clinical Pathologists, New Orleans
- 1980 American Cancer Society Award for Distinguished Service in Basic Research
- 1981 Kettering Prize of the General Motors Cancer Research Foundation for contributions to the diagnosis and treatment of cancer
- 1981 Honorary Doctorate of Medicine, University of Cagliari, Sardinia
- 1981 Special Keynote Address Award, American Society of Therapeutic Radiologists

Edward Donnall (Don) Thomas has been called the father of bone-marrow transplantation. Until the 1970s, every reported human marrow transplant had failed, and prominent immunologists declared that the barriers between individuals could never be crossed. Thomas persisted and eventually succeeded, sharing a Nobel prize for the feat in 1990. Since 1969, around one million patients with otherwise fatal blood disorders have received bone-marrow transplants.

Thomas died on 20 October 2012, aged 92, of heart failure. He was born in Mart, Texas, and his father was a general practice doctor, whom he often accompanied on house calls. Thomas received his bachelor's and master's degrees in organic chemistry from the University of Texas at Austin in 1941 and 1943, respectively. In 1942, he married fellow student Dorothy (Dottie) Martin. She helped to manage his research and papers throughout his career — the late George Santos of Johns Hopkins University School of Medicine in Baltimore, Maryland, once said: "If Dr Thomas is the father of bone-marrow transplantation, then Dottie Thomas is the mother." The couple had three children, two of whom are physicians.

Edward Donnall Thomas Credit: COURTESY OF DOTTIE THOMAS

In 1946, Thomas received his MD degree from Harvard Medical School in Boston, Massachusetts, followed by residency training at the city's Peter Bent Brigham Hospital and then service in the US Army. In 1950, he returned to the area as a research fellow at the Massachusetts Institute of Technology in Cambridge, and then as chief resident and instructor in medicine at Harvard.

In 1955, Thomas was appointed physician-in-chief at the Mary Imogene Bassett Hospital in Cooperstown, New York. Here he became fascinated by the discovery that rodents given a lethal dose of radiation could be rescued by an intravenous infusion of marrow cells from a donor. **In 1957, Thomas treated a patient with leukaemia using high doses of total-body irradiation to wipe out the cancer, and then gave them an infusion of marrow cells from an identical twin. The transplant was at first successful, although the patient later died from a recurrence of the leukaemia.**

Meanwhile, the medical literature was charting numerous cases of patients with blood disorders who had been treated using marrow transplantation from healthy family members. All the patients died from infections or severe immune reactions that were not predicted from studies in inbred rodents. Many investigators left the field, pronouncing it a dead end

Thomas did not give up. In 1957 he began experimenting in dogs. Like humans, dogs have unusual phenotypic diversity, a well-mixed gene pool and can develop haematological diseases, including non-Hodgkin lymphoma. In late 1963, Thomas set up his laboratory at the United States Public Health Service (USPHS) Hospital in Seattle, which was affiliated to the University of Washington's medical school.

When I joined his small band of scientists in 1965 as a research fellow, transplantation was not a widely known concept. Indeed, the university's print shop once produced letterhead stationery for us that read "Division of Hematology and Transportation". A remarkable thing about Thomas's leadership style was that he was happy to give people like me a free hand in innovating, as long as it helped the patients.

Under Thomas's guidance, we spent the 1960s developing high-intensity irradiation treatments to eradicate patients' cancer cells and establishing the importance of tissue matching for transplant outcome. To control and treat graft-versus-host disease, we developed drug combinations to suppress the immune system and produced antibodies against human lymphocytes — which once involved a 1.5-hour chase of an antibody-producing horse. Our total-body irradiation sources were set up in a Second World War underground bunker.

Work with patients began in 1969 at the USPHS hospital. Initial survival rates were low, and unexpected problems required going back and forth between bench and bedside — something that remained a hallmark of Thomas's work. By 1979, after performing a number of transplants, we were able to describe a phenomenon called graft-versus-tumour effects, in which donor lymphocytes help to eliminate residual malignant cells. There are patients who received transplants in 1971 still alive today.

Progress has been slow but steady. Early marrow donors were siblings. In 1979, the first patient with leukaemia was successfully treated with a transplant from an unrelated donor using new immunosuppressant drugs. This success sparked Thomas and others to set up international marrow-donor programmes. Transplant outcomes have improved, with survival rates for some diseases, such as aplastic anaemia, close to 95%.

In 1972, the US government closed the USPHS hospital. This prompted the founding of the private Fred Hutchinson Cancer Research Center (the Hutch), with close ties to the University of Washington's medical school. Thomas headed the medical oncology divisions at both.

Over the years, Thomas's team trained hundreds of young investigators. As one of them put it: "Virtually every major transplant centre in the world got its start by sending someone to train under Don Thomas." Owing to his influence, the Hutch's clinical focus has always been the patient, and its approach, one of teamwork. After retiring in 1989, Thomas continued writing manuscripts, lecturing and serving as an ambassador for the place.

Besides science, Don and Dottie had a passion for fishing and hunting, the fruits of which they shared at intimate dinners with colleagues and friends at their modest home. Reserved, hardworking and uncompromising, Thomas generously attributed much of his success to colleagues, nurses, support staff, patients and their families.

Erich Traub (27 June 1906 – 18 May 1985) was a German veterinarian, scientist and virologist who specialized in foot-and-mouth disease, Rinderpest and Newcastle disease. Traub was a member of the National Socialist Motor Corps (NSKK), a Nazi motorist corps, from 1938 to 1942. He worked directly for Heinrich Himmler, head of the Schutzstaffel (SS), as the lab chief of the Nazis' leading bio-weapons facility on Riems Island.[1]

Traub was rescued from the Soviet zone of Germany after World War II and taken to the United States in 1949 under the auspices of the United States government program Operation Paperclip, meant to exploit the post-war scientific knowledge in Germany, and deny it to the Soviet Union.[2]

Career

Early career and war

During the 1930s, he studied on a fellowship at the Rockefeller Institute for Medical Research in Princeton, New Jersey mentored by [**Dr. Richard Edwin Shope (born 1901)**], performing research on vaccines and viruses, including pseudorabies virus and lymphocytic choriomeningitis virus (LCM).[3][4][5] During his stay in the United States, Traub and his wife were listed as members of the German American Bund, a pro-Nazi German-American club thirty miles west of Plum Island in Yaphank, Long Island, from 1934 to 1935.[6]

Traub worked at the University of Giessen, Germany, from 1938 to 1942.[7] Traub was a member of the Nazi NSKK, a motorist corps, from 1938 to 1942. The NSKK was declared a condemned, not a criminal organization at the Nuremberg trials.[1]

From 1942 to 1948, Traub worked as lab-chief at the Reich Research Institute for Virus Diseases of Animals (German: Reichsforschungsanstalt für Viruskrankheiten der Tiere) on Riems Island (German: Insel Riems), a German animal virus research institute in the Baltic sea, now named the Friedrich Loeffler Institute. The institute was headed by Prof. Dr. Otto Waldmann from 1919 to 1948, while Traub was vice-president.[7]

The Institute at Riems Island was a dual use facility during the Second World War where at least some biological warfare experiments were conducted. It had been founded in 1909-10 to study foot-and-mouth disease in animals and by World War II employed about 20 scientists and a staff of 70-120. Hanns-Christoph Nagel, a veterinarian and biological warfare expert for the German Army, conducted experiments there, as did Traub.[7]

The institute was administered under the Innenministerium (Ministry of the Interior), which Reichsführer-SS Heinrich Himmler took over in 1943. The chain of command was Himmler, Dr. Leonardo Conti (Reich Health Leader), [**Dr. Kurt Blome (born 1894)**], Waldmann, and then Traub. Traub specialized in viral and bacterial diseases. He was assisted by Anna Bürger, who was later also brought to the United States after the war, to work with the Navy's biological warfare program.[8]

On orders from Himmler and Blome, the Deputy Reich Health Leader and head of the German biological warfare program, Traub worked on weaponizing foot-and-mouth disease virus, which has been reported to have been dispersed by aircraft onto cattle and reindeer in Russia.[9] In 1944, Blome sent Traub to pick up a strain of Rinderpest virus in Turkey; upon his return, this strain proved inactive (nonvirulent) and therefore plans for a Rinderpest product were shelved.[1]

Post-war

Immediately after the war Traub was trapped in the Soviet zone of Allied occupied Germany. He was forced to work for the Soviets from his lab on Riems Island.[10] **In July 1948, the British evacuated Erich Traub from Riems Island as a "high priority Intelligence target" since it was now in the Soviet Zone and they feared that Traub was assisting in their biological warfare program.** Traub denied this, however, claiming that his only interest was foot-and-mouth disease in animals.[11]

Traub was brought to the United States in 1949 under the auspices of the United States government program Operation Paperclip, meant to exploit scientific knowledge in Germany, and deny it to the Soviet Union.[2] From 1949 to 1953, he was associated with the Naval Medical Research Institute in Bethesda, Maryland.[7]

Months into his Operation Paperclip contract, Traub was asked to meet with US scientists from Fort Detrick, the Army's biological warfare headquarters, in Frederick, Maryland. As a noted German authority on viruses he was asked to consult on their animal disease program from a Biological Warfare perspective. Traub discussed work done at the Reich Research Institute for Virus Diseases of Animals on Riems Island during World War II for the Nazis, and work done after the war there for the Russians. Traub gave a detailed explanation of the secret operation at the Institute, and his activities there. This information provided the ground work for Fort Detrick's offshore germ warfare animal disease lab on Plum Island.[6] [The facility on Plum Island later became the **Plum Island Animal Disease Center**].

His publicly published research from his time in the United States reports disease research not directly related to weaponization. In 1951, he published a report for the Naval Medical Research Institute on Newcastle Disease virus in chicken and mammalian blood cells.[12] Two years later, he published a paper for the Navy on the mechanisms of immunity in chickens to Newcastle and the possible role of cellular factors.[13] Also in 1953, he published another paper for the Navy with Worth I. Capps on the foot-and-mouth disease virus and methods for rapid adaptation.[14]

Traub served as an expert on foot-and-mouth disease for the FAO of the UN in Bogota, Colombia, from 1951 to 1952, in Tehran, Iran, from 1963 to 1967, and in Ankara, Turkey, from 1969 to 1971.

Return to Germany

Tombstone

After working on biological research for the U.S. Navy from 1949 to 1953, Traub returned to Germany and founded a new branch of the Loeffler Institut in Tübingen, and headed it from 1953 to 1963.[15] In 1960, Traub resigned as Tübingen's director due to the scandal related to accusations of financial embezzlement. He continued with limited lab research for three more years, but then ended his career at Tübingen.[10]

In 1964, Traub published a study for the Army Biological labs in Frederick, Maryland on Eastern Equine Encephalomyeltitis (EEE) immunity in white mice and its relationship to Lymphocytic choriomeningitis (LCM), which had long been a research interest of his.[16]

He retired from the West German civil service in 1971. In 1972, on the occasion of the 500th anniversary of Ludwig Maximilian University of Munich Traub received an honorary doctorate degree in Veterinary Medicine for his achievements in basic and applied Virology (basic research on LCM; definition and diagnosis of type strains of FMD and their variants; development of adsorbate vaccines against fowl plague, Teschen disease of swine, and erysipelas of swine).

On May 18, 1985, Traub died in his sleep in West Germany. He was seventy-eight years old.[10]

Bio-weapon research

This section may stray from the topic of the article. Please help improve this section or discuss this issue on the talk page. (May 2019)

In theory, insects of all types, particularly the biting species, can be used as disease vectors in a biological warfare program. Germany, Japan, Britain, Russia and the U.S. all conducted experiments along these lines during the Second World War, and the Japanese used such insect-borne diseases against both soldiers and civilians in China. This was one reason that President Franklin Roosevelt and Secretary of War Henry Stimson ordered the creation of an American biological warfare program in 1942, which was headquartered at Camp Detrick, Maryland. This eventually grew to a very large facility with 245 buildings and a $60 million budget, including an Entomological Weapons Department that mass-produced flies, lice and mosquitoes as disease vectors. Although the British bio-weapon facility at Porton Down concentrated on the production of anthrax bombs, it also conducted experiments on insects as vectors.

After the war, the Army's 406th Medical General Laboratory in Japan cooperated with former scientists from Unit 731 in experimenting with many different insect vectors, including lice, flies, mosquitoes, ticks, fleas, spiders and beetles to carry a wide variety of diseases, from cholera to meningitis. At Fort Detrick in the late 1940s, Theodore Rosebury also rated insect vectors very highly, and its entomological division had at least three insect-vectored weapons ready for use by 1950. Some of these were later tested at the Dugway Proving Grounds in Utah, and allegedly used during the Korean War as well.[17]

Traub visited the [Plum Island Animal Disease Center] (PIADC) in New York on at least three occasions in the 1950s. The Plum Island facility, operated by the Department of Agriculture, conducted research on foot-and-mouth disease (FMD) of cattle, one of Traub's areas of expertise.[1] Traub was offered a leading position at the [Plum Island Animal Disease Center] in 1958 which he officially declined. It has been alleged that the United States performed bioweapons research on Plum Island.[1][18]

Fort Terry on Plum Island was part of the U.S. biological warfare program in 1944-46, working on veterinary testing in connection with the weaponization of brucellosis. After the war, research on biological weapons continued at Pine Bluff in Arkansas and Fort Detrick, Maryland, while officially at least [Plum Island Animal Disease Center] was transferred to the U.S. Department of Agriculture.[19] From 1949, Plum Island also conducted work on biological weapons against animals and livestock, such as foot-and-mouth disease, Rinderpest, Newcastle disease, African swine fever and plague and malaria in birds. Traub's research work from the Second World War onward involved at least the first three of these (all dangerous only to non-human animal species).[20]

Pages 7 - 11

Nearing the end of World War II, the United States and the Soviet Union raced to recruit German scientists for postwar purposes. Under a top-secret program code-named Project PAPERCLIP, the U.S. military pursued Nazi scientistic talent "like forbidden fruit," bringing them to America under employment contracts and offering them full U.S. citizenship. The recruits were supposed to be nominal participants in Nazi activities. But the zealous military recruited more than two thousand scientists, many of whom had dark Nazi party pasts. *{ Footnotes : The best known PAPERCLIP recruit was Wernher von Braun [...] }*

American scientists viewed these Germans as peers, and quickly forgot they were on opposite sides of a ghastly global war in which millions perished. Fearing brutal retaliation from the Soviets for the Nazis' vicious treatment of them, some scientists cooperated with the Americans to earn amnesty. Others played the two nations off each other to get the best financial deal in exchange for their services. [**Dr. Erich Traub]** was trapped on the Soviet side of the Iron Curtain after the war, and ordered to research germ warfare viruses for the Russians. **He pulled off a daring escape with his family to West Berlin in 1949.** Applying for Project PAPERCLIP employment, Traub affirmed he wanted to "do scientific work in the U.S.A., become an American citizen, and be protected from Russian reprisals."

As lab chief of Insel Riems—a secret Nazi biological warfare laboratory on a crescent-shaped island nestled in the Baltic Sea—[**Dr. Erich Traub**] **worked directly for Adolf Hitler's second-in-charge, SS Reichsführer Heinrich Himmler, on live germ trials**. He packaged weaponized foot-and-mouth disease virus, which was dispersed from a Luftwaffe bomber onto cattle and reindeer in occupied Russia. **At Himmler's request, Traub personally journeyed to the Black Sea coast of Turkey. There, amid the lush Anatolian terrain, he searched for a lethal strain of rinderpest virus for use against the Allies. Earlier in the war he had been a captain in the German Army, working as an expert on infectious animal diseases, particularly in horses. His veterinary corps led the germ warfare attacks on horses in the United States and Romania in World War I with a bacteria called glanders.** He was also a member of NSKK, the Nazi Motorists Corps, a powerful Nazi organization that ranked directly behind the SA (Storm Troopers) and the SS (Elite Corps). In fact, NSKK's first member, joining in April 1930, was Adolf Hitler himself. [**Dr. Erich Traub**] also listed his 1930s membership in Amerika-Deutscher Volksbund, a German-American "club" also known as Camp Sigfried. Just thirty miles west of Plum Island in Yaphank, Long Island, Camp Sigfried was the national headquarters of the American Nazi movement. Over forty thousand people throughout the New York region arrived by train, bus, and car to participate in Nuremberg-like rallies. Each weekend they marched in lockstep divisions, carrying swastika flags, burning Jewish U.S. congressmen in effigy, and singing anti-Semitic songs. Above all, they solemnly pledged their allegiance to Hitler and the Third Reich.

Ironically, [**Dr. Erich Traub**] **spent the prewar period of his scientific career on a fellowship at the Rockefeller Institute in Princeton, New Jersey,** perfecting his skills in viruses and bacteria under the tutelage of American experts before returning to Nazi Germany on the eve of war. **Despite Traub's troubling war record, the U.S. Navy recruited him for its scientific designs, and stationed him at the Naval Medical Research Institute in Bethesda, Maryland.** *{ Footnotes : Another PAPERCLIP recruit who worked alongside Traub at the Naval Medical Research Institute was **Theodur Benzinger**, an "aviation doctor." Benzinger was invited by Heinrich Himmler to view a film on high-altitude simulations at Dachau using prisoners as human guinea pigs (a "37-year-old Jew*

in good condition who lasted 30 minutes—he began to perspire, wriggle his head, developed cramps, became breathless, and [with] foam collecting around his mouth became unconscious and died"). Arrested for war crimes by Nuremberg prosecutors, he denied experimenting with any prisoners. He evaded prosecution at the Nuremberg Doctors' Trial and rushed into the waiting arms of Project PAPERCLIP. }

Just months into his PAPERCLIP contract, the germ warriors of Fort Detrick, the Army's biological warfare headquarters in Frederick, Maryland, and CIA operatives invited [**Dr. Erich Traub**] in for a talk, later reported in a declassified top-secret summary:

- [**Dr. Erich Traub**] is a noted authority on viruses and diseases in Germany and Europe. This interrogation revealed much information of value to the animal disease program from a Biological Warfare point of view. Dr. Traub discussed work done at a German animal disease station during World War II and subsequent to the war when the station was under Russian control. *{ Footnotes - According to the document, a transcript of the meeting was prepared by the CIA. When I requested the transcript under the Freedom of Information Act, the CIA informed me that no such report ever existed, and if it did, it would be withheld for reasons of national security. }*

[**Dr. Erich Traub**]'s detailed explanation of the secret operation on Insel Riems, and his activities there during the war and for the Soviets, laid the groundwork for Fort Detrick's offshore germ warfare animal disease lab on Plum Island. Traub was a founding father.

Little is publicly available about his clandestine activities for the U.S. military. The names of two studies, "Experiments with Chick Embryo Adapted Foot-and-mouth Disease" and "Studies on In-vitro Multiplication of Newcastle Disease Virus in Chicken Blood," were made available under the Freedom of Information Act, but the research reports themselves (and many others) were withheld. With his "laboratory assistant" Anne Burger, who came over in 1951, [**Dr. Erich Traub**] experimented with over forty lethal viruses on large test animals. *{ Footnotes - Linda Hunt, author of Secret Agenda, the seminal book on Project PAPERCLIP, believes Burger may not have been Traub's "assistant," but rather his mistress. Apparently other PAPERCLIP recruits had imported their mistresses from Germany along with their families when they came to America. No additional information is available to the public on Anne Burger. }*

[**Dr. Erich Traub**] also spent time at the USDA laboratories in Beltsville, Maryland, where he isolated a new weapons-grade virus strain in the USDA lab. Studying a virulent strain of a new virus that caused human infections, **Traub showed how it adapted "neurotropically" in humans by voraciously attacking nerve and brain tissues.** This was the same potent virus that infected a human in Plum Island's first-ever germ experiment one year later.

By 1953, West Germany recognized a need for its own Insel Riems and built a high-containment virus facility in Tübingen. They asked **Dr. Erich Traub** to return to the Fatherland and assume command. Permission was granted. But there was a catch. "In view of Dr. Traub's eminence as an international authority and the recognizable military potentialities in the possible application of his specialty, it is recommended that future surveillance in appropriate measure be maintained after the specialist's return to Germany." In other words, the CIA would be tailing him for years. As soon as the lab opened for business, he turned to Plum Island for starter strains of viruses, which were gladly shipped over. USDA officials traveled to West Germany and visited his laboratory often.

ERICH TRAUB AND PLUM ISLAND

Everybody seemed willing to forget about [**Dr. Erich Traub**]'s dirty past—**that he had played a crucial role in the Nazis' "Cancer Research Program," the cover name for their biological warfare program, and that he worked directly under SS Reichsführer Heinrich Himmler**. They seemed willing to overlook that Traub in the 1930s faithfully attended Camp Sigfried. **In fact, the USDA liked him so much, it glossed over his dubious past and offered him the top scientist job at the new Plum Island laboratory—not once, but twice. Just months after the 1952 public hearings on selecting Plum Island, Doc Shahan dialed Dr. Traub at the naval laboratory to discuss plans for establishing the germ laboratory and a position on Plum Island.**

Six years later—and only two years after [**Dr. Erich Traub**] squirmed in his seat at the Plum Island dedication ceremonies—senior scientist Dr. Jacob Traum retired. The USDA needed someone of "outstanding caliber, with a long established reputation, internationally as well as nationally," to fill Dr. Traum's shoes. But somehow it couldn't find a suitable American. "As a last resort it is now proposed that a foreigner be employed." The aggies' choice? [**Dr. Erich Traub**], who was in their view "the most desirable candidate from any source." **The 1958 secret USDA memorandum "Justification for Employment of Dr. Erich Traub" conveniently omitted his World War II activities; but it did emphasize that "his originality, scientific abilities, and general competence as an investigator" were developed at the Rockefeller Institute in New Jersey in the 1930s.**

The letters supporting [**Dr. Erich Traub**] to lead Plum Island came in from fellow Plum Island founders. "I hope that every effort will be made to get him. He has had long and productive experience in both prewar and postwar Germany," said [Dr. William Arthur Hagan (born 1893)] Dr. William Hagan, dean of the Cornell University veterinary school, carefully dispensing with his wartime activities. **The final word came from his dear American friend and old Rockefeller Institute boss [Dr. Richard Edwin Shope (born 1901)], who described Traub as "careful, skillful, productive, and very original" and "one of this world's most outstanding virologists." Shope's sole reference to Traub at war: "During the war he was in Germany serving in the German Army."**

Declining the USDA's offer, [**Dr. Erich Traub**] **continued his directorship of the Tübingen laboratory in West Germany, though he visited Plum Island frequently**. In 1960, he was forced to resign as Tübingen's director under a dark cloud of financial embezzlement. Traub continued sporadic lab research for another three years, and then left Tübingen for good—a scandalous end to a checkered career. **In the late 1970s, the esteemed virologist [Dr. Robert Ellis Shope (born 1929)], on business in Munich, paid his father Richard's old Rockefeller Institute disciple a visit.** The germ warrior had been in early retirement for about a decade by then. "I had dinner with Traub one day— out of old time's sake—and he was a pretty defeated man by then." On May 18, 1985, the Nazis' virus warrior [**Dr. Erich Traub**] died unexpectedly in his sleep in West Germany. He was seventy-eight years old.

A biological warfare mercenary who worked under three flags—Nazi Germany, the Soviet Union, and the United States—[**Dr. Erich Traub**] was never investigated for war crimes. He escaped any inquiry into his wartime past. The full extent of his sordid endeavors went with him to his grave.

While America brought a handful of Nazi war criminals to justice, it safeguarded many others in exchange for verses to the new state religion— modern science and espionage. Records detailing a fraction of [**Dr. Erich Traub**]'s activities are now available to the public, but most are withheld by Army intelligence and the CIA on grounds of national security. But there's enough of a glimpse to draw quite a sketch.

[...]

Pages 13 - 16

Attorney John Loftus was hired in 1979 by the Office of Special Investigations, a unit set up by the Justice Department to expose Nazi war crimes and unearth Nazis hiding in the United States. Given top-secret clearance to review files that had been sealed for thirty-five years, Loftus found a treasure trove of information on America's postwar Nazi recruiting. In 1982, publicly challenging the government's complacency with the wrongdoing, he told 60 Minutes that top Nazi officers had been protected and harbored in America by the CIA and the State Department.

"They got the Emmy Award," Loftus wrote. "My family got the death threats."

Old spies reached out to him after the publication of his book, The Belarus Secret, encouraged that he—unlike other authors—submitted his manuscript to the government, agreeing to censor portions to protect national security. The spooks gave him copies of secret documents and told him stories of clandestine operations. From these leads, Loftus ferreted out the dubious Nazi past of Austrian president and U.N. secretary general Kurt Waldheim. Loftus revealed that during World War II, Waldheim had been an officer in a German Army unit that committed atrocities in Yugoslavia. A disgraced Kurt Waldheim faded from the international scene soon thereafter.

In the preface of The Belarus Secret, Loftus laid out a striking piece of information gleaned from his spy network:

- Even more disturbing are the records of the Nazi germ warfare scientists who came to America. They experimented with poison ticks dropped from planes to spread rare diseases. I have received some information suggesting that the U.S. tested some of these poison ticks on the Plum Island artillery range off the coast of Connecticut during the early 1950s. . . . Most of the germ warfare records have been shredded, but there is a top secret U.S. document confirming that "clandestine attacks on crops and animals" took place at this time.

[**Dr. Erich Traub**] had been working for the American biological warfare program from his 1949 Soviet escape until 1953. We know he consulted with Fort Detrick scientists and CIA operatives; that he worked for the USDA for a brief stint; and that he spoke regularly with Plum Island director **Doc Shahan** in 1952. Traub can be physically placed on Plum Island at least three times—on dedication day in 1956 and two visits, once in 1957 and again in the spring of 1958. Shahan, who enforced an ultrastrict policy against outside visitors, each time received special clearance from the State Department to allow [**Dr. Erich Traub**] on Plum Island soil.

Research unearthed three USDA files from the vault of the National Archives—two were labeled TICK RESEARCH and a third E. TRAUB. All three folders were empty. The caked-on dust confirms the file boxes hadn't been open since the moment before they were taped shut in the 1950s.

Preposterous as it sounds, clandestine outdoor germ warfare trials were almost routine during this period. In 1952, the Joint Chiefs of Staff called for a "vigorous, well-planned, large-scale [biological warfare] test program . . . with all interested agencies participating." A top-secret letter to the secretary of defense later that year stated, "Steps should be taken to make certain adequate facilities are available, including those at Fort Detrick, Dugway Proving Ground, Fort Terry (Plum Island) and an island field testing area." Was Plum Island the island field testing area? Indeed, when the Army first scouted Plum Island for its Cold War designs, they charted wind speeds and direction and found that, much to their liking, the prevailing winds blew out to sea.

One of the participating "interested agencies" was the USDA, which admittedly set up large plots of land throughout the Midwest for airborne anticrop germ spray tests. Fort Detrick's Special Operations Division ran "vulnerability tests" in which operatives walked around Washington, D.C., and San Francisco with suitcases holding Serratia marcescens—a bacteria recommended to Fort Detrick by [**Dr. Erich Traub**]'s **nominal supervisor, Nazi germ czar and Nuremberg defendant [Dr. Kurt Blome (born 1894)]**. Tiny perforations allowed the germs' release so they could trace the flow of the germs through airports and bus terminals. Shortly thereafter, eleven elderly men and women checked into hospitals with never-before-seen Serratia marcescens infections. One patient died. Decades later when the germ tests were disclosed, the Army denied responsibility. A Department of Defense report later admitted the germ was "an opportunistic pathogen . . . causing infections of the endocardium, blood, wounds, and urinary and respiratory tracts." In the summer of 1966, Special Operations men walked into three New York City subway stations and tossed lightbulbs filled with Bacillus subtilis, a benign bacteria, onto the tracks. The subway trains pushed the germs through the entire system and theoretically killed over a million passengers. Tests were also run with live, virulent, anti-animal germ agents. Two hogcholera bombs were exploded at an altitude of 1,500 feet over pigpens set up at Eglin Air Force Base in Florida. And turkey feathers laced with Newcastle disease virus were dropped on animals grazing on a University of Wisconsin farm. *{Footnote : Traub likely developed the standardized Newcastle disease virus placed on the biological cluster bomb by concentrating the germ in chicken blood while he was working at the Naval Medical Research Institute for Project PAPERCLIP. }*

The Army never fully withdrew its germ warfare efforts against food animals. Two years after the Army gave Plum Island to the USDA—and three years after it told President Eisenhower it had ended all biological warfare against food animals—the Joint Chiefs advised that "research on anti-animal agent-munition combinations should" continue, as well as "field testing of anti-food agent munition combinations. . . ." In November 1957, military intelligence examined the elimination of the food supply of the Sino-Soviet Bloc, right down to the calories required for victory:

- In order to have a crippling effect on the economy of the USSR, the food and animal crop resources of the USSR would have to be damaged within a single growing season to the extent necessary to reduce the present average daily caloric intake from 2,800 calories to 1,400 calories; i.e., the starvation level. Reduction of food resources to this level, if maintained for twelve months, would produce 20 percent fatalities, and would decrease manual labor performance by 95 percent and clerical and light labor performance by 80 percent.

At least six outdoor stockyard tests occurred in 1964–65. Simulants were sprayed into stockyards in Fort Worth, Kansas City, St. Paul, Sioux Falls, and Omaha in tests determining how much foot-and-mouth disease virus would be required to destroy the food supply.

Had the Army commandeered Plum Island for an outdoor trial? Maybe the USDA lent a hand with the trial, as it had done out west by furnishing the large test fields. After all, the Plum Island agreement between the Army and the USDA allowed the Army to borrow the island from the USDA when necessary and in the national interest.

[**Dr. Erich Traub**] might have monitored the tests. A source who worked on Plum Island in the 1950s recalls that animal handlers and a scientist released ticks outdoors on the island. "They called him the Nazi scientist, when they came in, in 1951—they were inoculating these ticks," and a picture he once saw "shows the animal handler pointing to the area on Plum where they released the ticks." **Dr. Traub's World War II handiwork consisted of aerial virus sprays developed on Insel Riems and tested over occupied Russia, and of field work for Heinrich Himmler in Turkey.** Indeed, his colleagues conducted bug trials by dropping live beetles from planes. An outdoor tick trial would have been de rigueur for Erich Traub.

Pages 41 - 43

A few years before the Plum Island Animal Disease Center's dedication day in 1956, the United States launched its first biological warfare program. A glimpse into the past reveals a surprising truth: Plum Island wasn't exactly what it appeared to be to the public.

The gory details were kept secret at the time, but America's germ warfare goals—national defense—were heralded by the nation's leaders and press. A New York Times editorial in 1945 mused, "When the scientific story of the war is written, we have here an epic that rivals that of the atomic bomb." The paper was right. A few months after the United States demonstrated its atomic warfare prowess on Japan, it announced the development of a second weapon: killer

microscopic germs. While forty-five people participated in the British biological warfare effort, the American version involved four thousand men and women. The Army ran the innocuously titled "War Research Service" (WRS) program at Fort Detrick in Frederick, Maryland. **Civilian chemist George W. Merck** [https://en.wikipedia.org/wiki/George_W._Merck] directed the work, advised by scientists from the nation's top universities.

These men were motivated by the threats of the times. In ways, they were no different from the atomic fathers Einstein and Oppenheimer. Theodor Rosebury, a Columbia University microbiologist who worked on the WRS projects, said, "We resolved the ethical question just as other equally good men resolved the same question at Oak Ridge and Los Alamos."

The aims of the biological warfare program didn't trouble Dr. Albert Webb, a Fort Detrick scientist in the early years. "That aspect never worried me personally. People had been killing people for millennia. Whether you hit him over the head with a club, stab him with a spear, or give him a disease he might get anyway—let's not balk at that." One has to look at the whole picture and understand the enemy of the time, says Webb. "We knew other nations, Germany and Japan—and Russia—were working on this, and in self-defense, we had to know what the potential was. Maybe it's not a popular thought today, but I still feel that it was necessary."

Dr. Edwin Fred, Dr. Webb's ultimate boss and the patriarch of WRS, was a veterinarian, as were Merck's top aide, Colonel Arvo Thompson, Fort Detrick founder Dr. Ira Baldwin, and [Dr. William Arthur Hagan (born 1893)] **(who, in addition to spawning Plum Island along with [Dr. Erich Traub], helped Baldwin establish Fort Detrick).** Like MDs, they were trained in infectious disease. But unlike their medical counterparts, the vets weren't ethically bound by an oath that began: "First, do no harm. . . ." **Dr. Webb recalled the mind-sets of the two branches of medicine. "The MDs had this unresolved medical conflict—they weren't supposed to help kill people. Vets, I think, were much more ready than MDs," he says. "There's obviously not the same feelings about the death of their subjects. The mass killing of animals for food is an accepted part of our culture." Unlikely as it seems, the veterinarian was ideally suited for germ warfare research and development.**

Before the attack on Pearl Harbor, a proud isolationism combined with the belief that biological warfare was pure fantasy left the United States woefully unprepared for—and fully exposed to—a real threat. Britain, Canada, Germany, Russia, Japan, and France had initiated germ warfare programs decades earlier. But America made up for the lost time. By war's end it built the largest and most advanced program of them all.

War Research Service launched "Project No. 1" in 1942. [Dr. William Arthur Hagan (born 1893)] was chosen to take the lead. Dean of the Cornell University Veterinary College, Dr. Hagan was an expert on Bacillus anthracis, or anthrax, a disease of sheep and cattle. Also known as woolsorter's disease, because the germ occasionally infected people shearing wool off sheep, it was a rare human affliction—but an exceptionally lethal one. Merck thought it would make a superb bioweapon and commissioned it as WRS's first priority. Anthrax is virulent, but it carries a minimal threat of a boomerang because it is not contagious person to person.

[Dr. William Arthur Hagan (born 1893)] tested many sample strains of anthrax (which WRS codenamed "N") in a four-foot-tall glass apparatus called a vinegar tower. Under the right conditions, anthrax rolls up into a ball and hibernates, or spores, and becomes resistant to threatening environmental conditions like cold temperatures. When returned to a hospitable environment, the hardy spores unfold and come back to life. Hagan found that Strain No. 99 sporulated and retained its high pathogenicity, or ability to spread disease. Dr. Hagan concentrated, purified, and dried Strain No. 99 into enough powder to make a biological bomb. In a small lab in Ithaca, New York, in 1943, Dr. Hagan created the most virulent, concentrated brand of anthrax on Earth. Anthrax became the most important biological agent developed by the American biological warfare program, and Hagan gained the dubious title of the father of weapons-grade anthrax. Late in the war, Great Britain requested samples of Hagan's anthrax, naming it "Hagan's Best."

After the war, [Dr. William Arthur Hagan (born 1893)] became a driving force behind Plum Island's creation (Nazi germ warfare scientist [**Dr. Erich Traub**] would be the other). He used his clout with Congress, the Army, and the USDA to lead the charge for an island virus laboratory. He inspected Plum Island personally and lent his imprimatur to its selection. Upon its inauguration, Hagan bequeathed to the island twelve vials of "N," enough to kill about a million people, considering it takes between 4,500 and 8,000 organisms to cause an infection. To this day, Plum Island denies ever hosting anthrax or working with it, though a now-declassified catalog of deadly germs imported to Plum Island in the early 1950s clearly shows that twelve vials of "N" have been kept in its freezers since the very beginning.

Presumably, [Dr. William Arthur Hagan (born 1893)] believed strongly that his secret wartime research would contribute to a greater good. However, the consequences of "Hagan's Best"—particularly in light of the deadly 2001 anthrax attacks— call into question that belief.

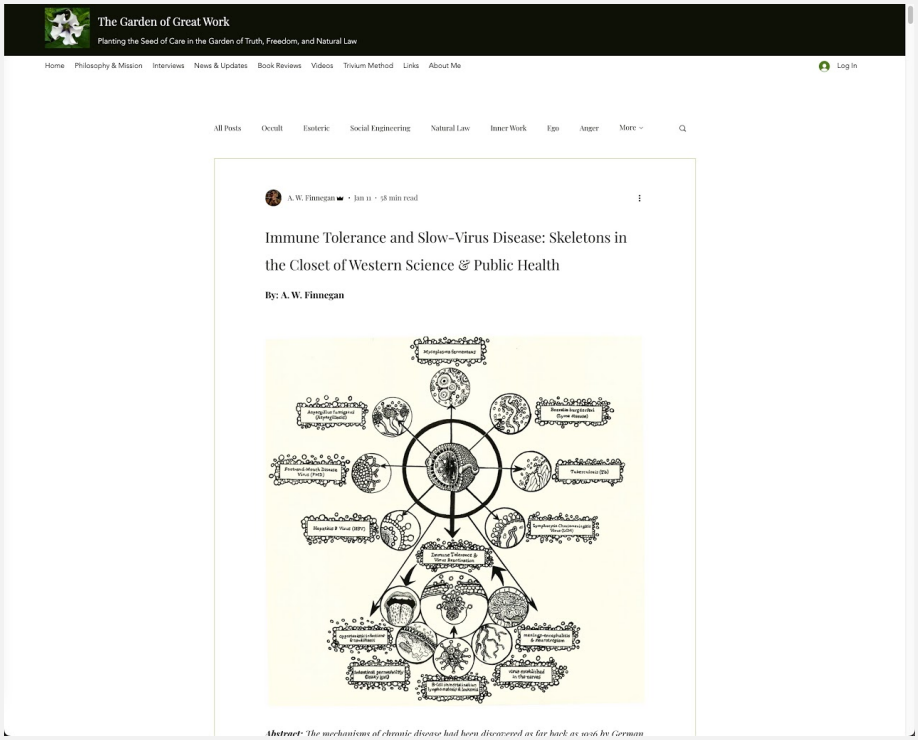
Page 55

Days before, Greenporters had noticed an uncommon buzz along Main Street—strangers darting in and out of shops, eating and drinking heartily at Claudio's and the clam bar out on the pier. Some had distinctive southern and western accents. Others spoke in foreign tongues. But all wore expressions of great anticipation. Locals opened their spare rooms, recently vacated at summer's end, to welcome them. A special ferry was arranged with the New London Freight Lines; the massive LSM transport craft that landed amphibious battalions on the shores of Okinawa during World War II a decade earlier would now land on Plum Island an excited throng of general public and VIPs. Plum Island scientists wearing patriotic red, white, and blue badges pinned to their lapels escorted local residents around the island and inside the heralded chalk-white laboratory. Members of local civic organizations came, too, from the Rotary Club, the Minnepaug Club, and the Southold Tuesday Morning Club, as did national agricultural associations and high school science teachers with their classes in tow.

Master of ceremonies was new Plum Island Director Doc Shahan— smartly dressed in a sharp two-button black suit, crisp white shirt, diagonally striped thin tie, and a handkerchief ironed into a square that peeked out of his breast pocket. Sitting in front of him, in the roped-off seating areas up front, were the VIPs: Plum Island's founding father, [Dr. William Arthur Hagan (born 1893)]; the island's former commanding officer, Army Colonel Donald Mace; top military brass from Fort Detrick, Maryland; and finally a slew of European research scientists. Among them was the director of West Germany's new State Research Laboratory at Tübingen, [**Dr. Erich Traub**].

2021 (Jan) blog post - GardenOfGreatWork - Slow viruses, immune tolerance, Eric Traub

Website : https://www.gardenofgreatwork.org/ / Saved source of this full article : [HW005X][GDrive]



[HW005Y][GDrive]

[...] This scientific discovery which underlies chronic disease was actually discovered by German researcher Erich Traub starting in 1936 with the virus of Lymphocytic Choriomeningitis Virus (LCM), but his contribution was not publicized or credited to Traub, it was instead given to other scientists having to do with something more obscure. [2] This was an act that would bring untold suffering and unnecessary harm for future generations, because it was at this point that science and public health began to turn their backs on a large portion of immunology and one-half of the entire spectrum of disease- chronic disease- and medical progress has been moving nearly in reverse ever since. [3] [...] This act of denying the infectious processes of immune tolerance many years ago, was a pivotal moment in which profiteering and ego became more important than the easing of human suffering, because if the science of immune tolerance had been acknowledged for what it was and the implications that it implied, those in the established science and public health systems would have been forced to rethink the entire paradigm of immunology, vaccination, inflammation, and the very nature of disease itself. This would indicate that the act was done, not just because of the controversial background of its German pioneer, Erich Traub, but because of conflicts of interest involving profiteering and the reputation of establishment science and Big Pharma.

Immune Tolerance, as I will show, is the term that denotes the condition that underlies most if not all of chronic disease, a relapsing/remitting yet progressive condition that ties autoimmune conditions, genetic disorders, endless syndromes, and mental illness to para-infectious mechanisms, through a disrupted immune system and neurotropism, by the proliferation and persistence of a disseminated viral syndrome, where latent viruses already present in the body will reactivate and turn on the body, making the bulk of the condition itself. [5] [6] [7] [8] It is akin to turning one's own microbiome against itself, and no doubt, it is why so many people have so much trouble getting well. [9] This process and proliferation of antigen makes it hard to absorb and take in nutrients, oxygen, and the like, [10] because there is a state of balanced parasitism, and the person will tend to operate at a very low capacity, being malnourished and highly diminished vitality. It is like being somewhat choked out or suffocated at the cellular level. [11]

Immune tolerance will often present without any outward symptoms, but the effect is still damaging due to the parasitic nature of the para-infectious invasion which remains in the body, and active infection can be entirely present without antibodies. [12] Oftentimes this balanced parasitism will turn in favor of the parasitism of virus and antigen. Erich Traub and his mentor Karl Beller noted this in his studies of an AIDS virus of horses, Equine Infectious Anemia Virus (EIA), and the resultant condition was not a true immunity:

It is therefore very questionable whether this is a true immunity. The term "prämunity", which originates from French and becomes more and more natural in German terminology, would probably be more appropriate here. In human and animal protozoal diseases, after the survival of the clinical phenomena existing equilibrium state between parasite and organism, in which the latter is usually resistant to a new infection. Due to damaging influences on the body, this state of equilibrium can change in favor of the parasite. Similar observations were made in [infectious anemia]. [13]

As a result of this truly immoral act of burying the science of immune tolerance, a harmful butterfly effect would take root and branch into every facet of life, every angle of health would be significantly affected, to such an extent that it would change the course of history in untold, unprecedented ways. [14] This fraud would have a cumulative effect that would only grow in intensity over the years, each decade would become more unstable, and to cover these tracks, more unsound explanations would have to be layered over it, and the more out of line with Truth reality became, the more chaotic and unstable its consequences would follow in public health. If there is any hope of fixing this diabolical treason, we must revisit the past, and recall the events in which it took root...

Traub's Discovery of Immune Tolerance

In 1935, a German student studying on a scholarship at the Rockefeller Institute, Erich Traub, was studying the reactivation of latent viruses in equine

encephalomyelitis and swine fever virus (hog cholera), [15] after transmission studies with Richard Shope in Iowa on the pseudorabies virus, a swine herpesvirus unrelated to rabies, [16] after which Traub began a series of experiments in mice, where he was attempting to reactivate a latent virus to cause an epidemic in the mouse colony at the Institute. He injected the mice intracerebrally with foreign proteins or antigen suspended in sterile bouillon, and within short order, an outbreak ensued and infected most of the other mice in the colony, though they all had been otherwise healthy mice before the experiment:

- *During recent work with the viruses of equine encephalomyelitis and hog cholera an infective agent was obtained from white mice which was pathologically and serologically distinct from both viruses. Its origin was not definitely known, but it seemed likely that the natural host of the agent was the mouse, in spite of the fact that in our mouse colony no disease had been previously recognized. In an experiment designed to trace the origin of the infectious agent, 60 five-week-old, healthy-looking mice from our colony were each given an intracerebral injection of a small amount of sterile bouillon. Fifty-one of these mice showed no evidence of illness during the three weeks that they were under observation. Four died in from 3 to 13 days following the inoculation, and three were killed on from the sixth to the eighth day when they showed symptoms similar to those observed in the mice inoculated with the unknown agent. On the sixth day two additional mice that showed photophobia but no other symptoms were killed. From one of these mice no material was obtained for inoculation, but bacteriologically sterile suspensions of the brain of each of the other eight when injected into guinea-pigs caused symptoms which could not be differentiated from those produced by the original material. This experiment, together with others, suggests that the infectious agent is carried by apparently healthy mice in our colony and that symptoms may be brought out by the intracerebral injection of foreign protein. [17]*

The outbreak, however, was not just restricted to the mice, because soon some of the lab technicians and animal keepers contracted the virus and had to be hospitalized, infected with this new virus, which they called Lymphocytic Choriomeningitis Virus (LCM):

- *In 1935 an epidemic of meningitis of a special type (acute lymphocytic choriomeningitis) broke out in the mouse colony in Princeton. Erich Traub recovered a virus to which he gave several years of intensive study before he left the Institute in 1938. [Interestingly], one of the Princeton staff contracted this disease during the mouse epidemic and was studied at The Rockefeller Institute Hospital by T.M. Rivers and T.F.M. Scott, who isolated from him a filtrable agent identical with Traub's. Traub's observations show that the mouse is the natural host of this potentially serious infection, which, fortunately, only occasionally causes illness in human beings. The virus, kept alive in mice by healthy carriers, is acquired by infant mice from their mother while still in utero or shortly after birth. Usually remaining latent, like many other viruses it is occasionally awakened to virulence by some accidental circumstance, causing a disease which spreads with epidemic rapidity. [18]*

This was transmissible and able to spread from animal to human. Traub studied this virus in the colony for several years and noted its persistence in the colony, establishing acute and chronic infections, which set the discovery of immune tolerance in 1936. [19] He noted congenital transmission from mother to newborn, where the virus would persist and become increasingly more silent in the colonies, [20] but later in life the infected stock would present with blood cancers and leukemia, [21] as well as chronic, progressive neurodegenerative diseases in what was later termed early and late onset disease, [22] resembling debilitating chronic conditions that progressively destroyed the central nervous systems of these mice as they got older. [23] The study would be some of the early models of progressive neurodegenerative chronic diseases which would later become so prevalent in Western countries. [24]

Traub's seminal work on LCM virus became the model of an immunosuppressive, relapsing chronic disease, which would become so prevalent in Western societies in later generations. It was termed immune tolerance, in that the body's immune system was not immune to the virus, as in actively neutralizing it, but rather tolerized to the virus, meaning it would not respond to it, little to no antibodies would be produced after the initial infection, and the virus would be able to continue its replication and spread, establishing in the infected subject a slow-virus disease. [25] The slow-virus disease meant that the disease took a much slower, chronic course. The mother would transmit the virus to the young, and the young would be born tolerized to the virus, not showing outward symptoms but having a slow, chronic infection which later in life would turn to chronic disease and result in neurodegeneration, lymphomatosis and cancers. [26] [27]

Traub noticed that antibodies were minimal in the infected colonies, even though they were carriers and shedders of active virus. However, when the rest of the stock was more or less immune tolerant, it would be hard to tell this was the case, but the effect could be spotted if these mice were put into an uninfected colony. [28] Another phenomenon observed in the infected stock, was that the virus only remained in the blood for several weeks and then disappeared from the blood, taking to organ, tissues, brain, and some of the secretions and excretions. [29]

[...]

One of Traub's protégés in Germany, Zvonimir Dinter, writing in a later article submitted to the German medical journal Berliner und Münchener tierärztliche Wochenschrift in 1984, told his experience working with Traub, and suggested that he should have been part of the Nobel Prize for his discovery of immune tolerance in LCM virus:

- ***Traub, "who started the whole thing."** The TRAUB's lived on Riems in a mansion when I entered the villa, it was already twilight, you could hear the monotonous splashing of the Baltic Sea, it was a mood where memories are easily awakened. After coffee with cake, **TRAUB told me how he came to the US when [Dr. Richard Edwin Shope (born 1901)], the famous virologist from the Rockefeller Institute, spent his time in Giessen, among other places, in the early 1930s.** Zwick's work on the Borna Disease attracted researchers who poured in... like TRAUB, who was already considered a student proficient in English, to SHOPE he was assigned as a language facilitator. **SHOPE soon saw TRAUB's interest and talent in viral research and invited him to the Rockefeller Institute. Shope was right in his assumption.** Much later (1959), he told me himself.*
- *TRAUB's talent soon starts after he began research at Princeton, the Rockefeller Institute branch. The topic to which he dedicated his work in the first place was the behavior of the mouse lymphocytic choriomeningitis virus. A number of communications that began in Science and continued in the Journal of Experimental Medicine, and which are generally regarded as classical today, since "... many pioneering series of investigations in many of the key biological properties of the virus were established. "(1) **When BURNET and MEDAWAR received the Nobel Prize in 1960 for their seminal immunological work, I, as a veterinarian and TRAUB's employee, would have liked to see that he, too, had participated in the prize because what TRAUB already described in 1936 and 1939, was the mode of origin of the condition, which was later baptized with "immune tolerance" and which represented a pillar of Burnet's clone-selective theory (2). The American researcher HOTCHIN has appreciated TRAUB's dedication by giving him his monograph with the words: "To ERIC TRAUB who started the whole thing" (3). [148]***

The condition and its process would also be increasingly more complex as vaccinations were stacked on top of those already dealing with one or several chronic viral infections congenitally transmitted from mother to newborn, with no outward signs of disease upon birth, tolerized to virus, yet the effect of infection in the lifetime of that individual would be cumulative, [149] with early and late onset disease, [150] while the increasing number of vaccines given in the schedule adds infinitely more burden to an already confused and exhausted immune system, [151] it is akin to trying to put a fire out with gasoline.

Many people today can think of several families with autistic or mentally ill children, and the effect on a nation, if such angles were used in special weapons of bioterrorism geared for strategic, long-term attacks, a target country would be plagued by chronic health problems and mental illness, with failure to detect infection, and simply labelled 'somatoform' or 'mentally ill' with no infectious disease, [152] yet was very likely dealing with one or several infections. The course of disease by the immune tolerance complex would present only general similarities between subjects, with different courses and outcomes for each. [153] The result could be so various that the condition is grouped into many separate conditions between physical and mental health, leaving health practitioners and public health systems little to no understanding of the causal factors of immune tolerance and neurotropism.

The effect on mental health would present with varying degrees and combinations of neurotropism and damage to the brain, [154] expressing mood swings, lack of organization and cognitive abilities, irritability, rage, senseless acts of violence, irrational behaviors, lowered inhibitions resulting in an increase in criminal activity or deranged behavior, such that is very common in the headlines of Western nations today. [155] Simply put, to target the brain of a population would affect the societal structure as a whole, because the chaos of one effects the many, and when large numbers of unstable citizens with unpredictable and irrational or violent behaviors from neurotropic infections of the brain and CNS are scattered throughout its society presenting in this manner, [156] that is, infections passing congenitally through generations gaining more momentum in the subsequent generations infected, [157] the implications are systemic and far-reaching, tearing at the fabric of the society itself, as we are seeing the effects today, with Western countries leading in chronic disease and mental illnesses. [158] [159]

[...]

In the words of Dr. Erich Traub's protégé, Werner Schafer, a telling revelation spoken at a conference for the Office of Naval Research in Kansas in 1962 may once again hold the key to understanding the situation, albeit through the overtones of unbelievable irony:

- *I hope I have been able to demonstrate that the concentrated action of our group on a very small sector of animal virology was not quite unsuccessful but has created at least some ideas of possibly a more general importance for the fight against virus diseases.* ***At the present time, when concentrated scientific activity is often directed toward the destruction and not toward the preservation of life, one might fear that the phrase "concentration is the prudence of life" will someday be inverted into "concentration is the stupidity of life."*** *To avoid such an occurrence, scientific workers all over the world would do well to return to the ethics of the stoicist Seneca, who noted in his Naturales Quaestiones that "by exploration of the facts natural sciences base the moral life of man on a solid foundation; they liberate him from fear and let him recognize the glory and magnitude of divine creation."*

- Dr. Werner Schäfer, ONR lecture, presented at the Annual Meeting of the American Society for Microbiology, Kansas City, Mo., 6 May 1962. [202]

1885 (Oct) - Sailing from Germany to the United States

Blair, Gwenda. The Trumps: Three Generations of Builders and a Presidential Candidate (pp. 31-32). Simon & Schuster. Kindle Edition.

He left from Bremen, nearly 350 miles north of Kallstadt. The first port to require posted schedules and to take steps to ensure passenger safety and well-being, Bremen now lived off the north German immigrant trade. Like all German cities, it was a bustling but orderly place.18 All visitors spending more than twenty-four hours in the city were required to register with the police, and the streets were so clean that one could almost literally have eaten off them. Friedrich Trump spent his last days on German soil in one of Bremen's scores of boardinghouses, all filled to capacity with would-be Americans,19 as well as an abundant supply of Bauernfanger ("trappers of greenhorns"), ready to take advantage whenever possible.20 For about $20,21 Friedrich Trump bought not a berth but a space in steerage class on the SS Eider, the next boat out from the North German Lloyd Lines. On October 7, 1885, he boarded what was a modern steamship and soon was in the gray, frigid North Sea. Conditions were better than they had been before the steam age, but the voyage was still crowded and unpleasant for Friedrich.22 In calm weather the ship provided one scanty meal a day. Everything else was up to the passenger, who could cook on the deck if the ocean spray did not swamp the fire. Drinking water was in short supply; water for baths was nonexistent.23 The stink of "ship" quickly pervaded the air, and the sight of steerage passengers huddled over the weak fires on deck was depressing. Ten days after his departure, Friedrich Trump stood on the deck, a hawk-faced boy beneath a sheaf of light hair, waiting for his first glimpse of New York Harbor.

1891 - After the great Seattle fire (of 1889), Fred Trump decides to move from New York to Seattle

https://crosscut.com/2016/07/trump-family-roots-seattle-grandfather

The exact spot to look for opportunity [in America] has moved around: In the early 1890s it was in Seattle. The rebirth of the city after 1889's Great Fire called to people of all types in an urban version of "Go west, young man." It doubled Seattle's population in two years, adding 25,000 people.

[...] Frederick Trump [...] was drawn into Seattle like a moth after the fire. His time here has generated some recent controversy, with a number of stories seeking to paint him as a bit of an exploiter or worse.

[Great Seattle Fire : June 6, 1889 .. https://en.wikipedia.org/wiki/Great_Seattle_Fire]

Frederick Trump was cutting hair in New York, living with extended family when the Seattle fire made the news nationwide. He read about it perhaps in the New York Times or maybe in the New Yorker Staats-Zeitung in his native German. Trump [being born in 1869] was just 20 [at the time of the Seattle fire of 1889].

A few days after the [Seattle] fire, the Times reprinted a quote of Seattle city leader H. H. Dearborn, "The fire will prove a blessing in disguise." The follow-up a year later put the reconstruction in numbers: 465 buildings; 69,425,000 bricks; 60 wharves; and $10,000,000 of construction. "Seattle is a far handsomer and better city to live in than the old Seattle was," the Times reported.

Trump came to Seattle a year later, toward the end of 1891. He was listed in city directories and a few Seattle Post-Intelligencer advertisements [[See my own clip below... [HN00YQ][GDrive]]], so we know what he was doing. He switched from cutting hair to serving meals, operating a restaurant called The Dairy. It was just east of the northeast corner of Occidental and Washington, which is in today's Pioneer Square, and Trump lived in a hotel called Pacific House at the northwest corner of that intersection.

He arrived to a divided city, a fact that provides some complications for trying to understand Trump's time in Seattle. On the one hand there was no shortage of saloons, fight venues, gambling houses, or brothels. On the other hand, a coalition of progressives and moralists fought to clean up the city. While Trump was in Seattle, district attorney James T. Ronald was elected mayor.

Ronald fired the police chief on his first day in office and made sure state anti-gambling laws were enforced for the first time. Even Pioneer Square, now remembered simply as a hive of villainy, had a split personality. Used goods stores, pawnshops, outfitters and other upstanding merchants were shoulder to shoulder with the more unsavory venues.

*Trump's restaurant had good neighbors. He shared a building with several other restaurants and a handful of pawnbrokers. In a twist of fate that would make John Oliver smile, two doors over from Drumpf was a **jeweler named Rumpf**. Rumpf partnered with Joseph Mayer, who went on to build the street clocks that Seattle was once noted for.*

In 1891 the atmosphere was quite a bit different across the street where Trump lived. Downstairs from Pacific House were two saloons. The clink of poker chips drifted out on cigar smoke from one of them, and from the basement. These were two of Seattle's five unofficially sanctioned gambling houses. [...]

*We don't know much about Trump's restaurant. His predecessor **Spiro Bisazza** ran an ad for it in 1890 as **the Poodle Dog**, touting a new establishment with long hours, quality ingredients, meals for prince or pauper, and accommodations for women and families away from the predominately male clientele. It's probably safe to assume Trump operated under the same principles.*

THE STORM AT MONTE CRISTO.

Blockade Broken After Hard Work—A Building Crushed In.

Monte Cristo, Dec. 28.—Special.—The great storm which has prevailed during the past three weeks has been the severest ever known in the mining districts. For over two weeks rain, snow and hail has fallen until the snow lies about six feet deep on the level and is badly drifted in many places. The blockade on the Everett & Monte Cristo railroad was complete from Friday, December 18, to Thursday, December 26, when a train arrived, preceded by a rotary snowplow. They had reached Silverton the day before and left that station at 4:30 on Thursday morning for Monte Cristo with five gangs of section men. Fallen trees were encountered at many places, and at bridge 43 seven trees were bunched across the track. The telegraph wire was down all day Thursday. After a long day of hard work the train arrived at Monte Cristo at about 7:30 in the evening.

Shortly after midnight on Christmas morning the lodgers in the second story of Trump's restaurant were aroused by an ominous cracking of the roof over their heads. Quickly putting on their clothes they borrowed shovels, and, mounting to the roof, hurriedly cleared off the snow, which was about four feet deep. It was found that the tremendous weight had forced the rafters out at the lower ends, breaking the plate beams outward and badly weakening the roof, which will have to be rebuilt before the building will be safe. The ridgepole of the roof is "swaybacked" about six inches.

There was a great crushing of dead trees on all sides of town on Thursday, broken down by the heavy snow.

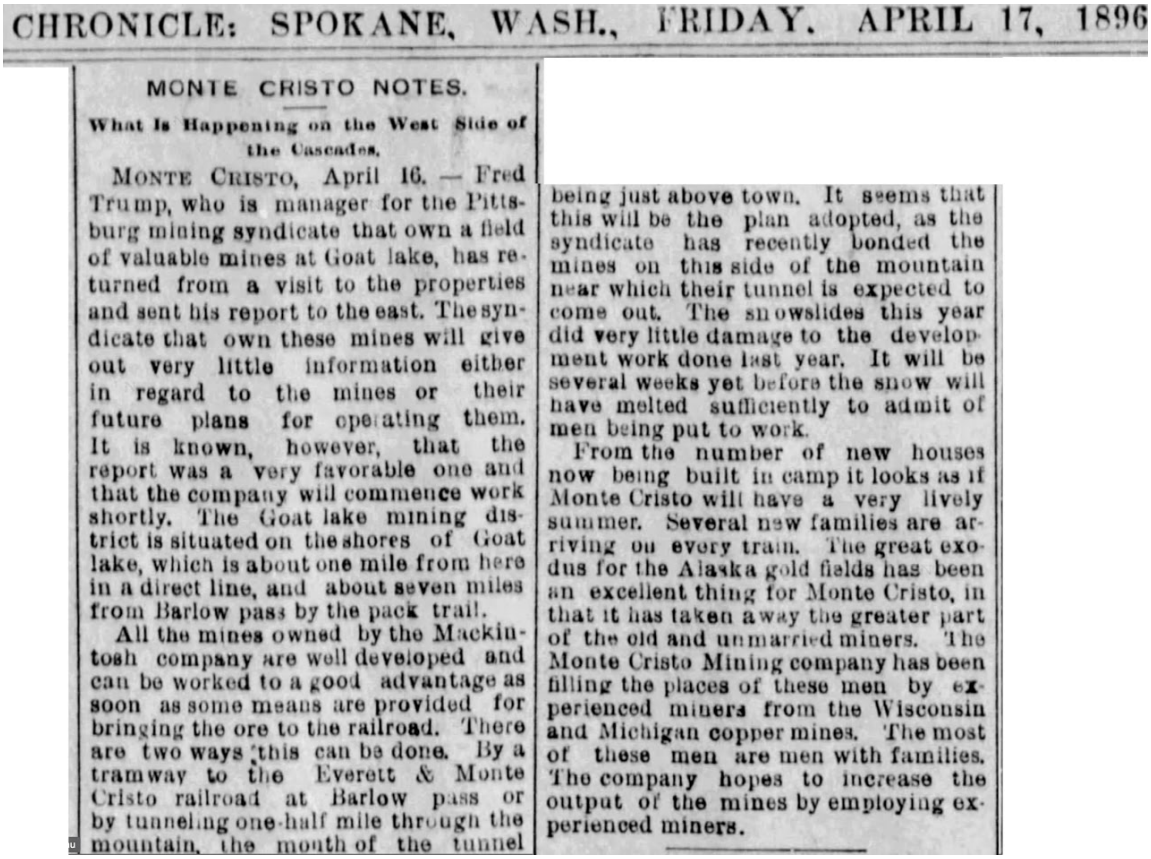
1896 (April 17)

Full page : [HN00X0][GDrive]



CHRONICLE: SPOKANE, WASH., FRIDAY, APRIL 17, 1896

MONTE CRISTO NOTES.

What Is Happening on the West Side of the Cascades.

MONTE CRISTO, April 16. — Fred Trump, who is manager for the Pittsburg mining syndicate that own a field of valuable mines at Goat lake, has returned from a visit to the properties and sent his report to the east. The syndicate that own these mines will give out very little information either in regard to the mines or their future plans for operating them. It is known, however, that the report was a very favorable one and that the company will commence work shortly. The Goat lake mining district is situated on the shores of Goat lake, which is about one mile from here in a direct line, and about seven miles from Barlow pass by the pack trail.

All the mines owned by the Mackintosh company are well developed and can be worked to a good advantage as soon as some means are provided for bringing the ore to the railroad. There are two ways this can be done. By a tramway to the Everett & Monte Cristo railroad at Barlow pass or by tunneling one-half mile through the mountain, the mouth of the tunnel being just above town. It seems that this will be the plan adopted, as the syndicate has recently bonded the mines on this side of the mountain near which their tunnel is expected to come out. The snowslides this year did very little damage to the development work done last year. It will be several weeks yet before the snow will have melted sufficiently to admit of men being put to work.

From the number of new houses now being built in camp it looks as if Monte Cristo will have a very lively summer. Several new families are arriving on every train. The great exodus for the Alaska gold fields has been an excellent thing for Monte Cristo, in that it has taken away the greater part of the old and unmarried miners. The Monte Cristo Mining company has been filling the places of these men by experienced miners from the Wisconsin and Michigan copper mines. The most of these men are men with families. The company hopes to increase the output of the mines by employing experienced miners.

Racing for a Fortune.

Early in December there started from Dawson an exciting race for a fortune, the longest and most unique, perhaps, that was ever recorded in the history of any mining camp, says the Seattle Post-Intelligencer. Two dog teams hurriedly left Dawson and went flying down the river over and unbroken trail to Circle City, a distance of 300 miles and beneath the rim of the Arctic circle. Fred Trump owned a half interest in claim No. 46 below discovery, on Hunker creek. Similar to many others, when provisions were scarce, he was compelled to leave for Fort Yukon, but never got as far as Circle City. There was practically no grub to be had, and he was without funds and repeatedly tried to sell the property for $2,000. Shortly after his departure from Dawson pay gravel running $5 to the pan was struck on No. 43. An offer of $50,000 for the claim was declined, and other properties adjoining became almost equally valuable. Captain Guiger came up from Circle City on December 4 and said that Trump was vainly trying to sell his half interest in No. 46 for $2000. That night at 10 o'clock a well equipped dog team started out over the ribbon of broken ice to Circle City with orders and gold dust to purchase the claim at any price under $25,000. At 4 o'clock the next morning a second team followed in hot pursuit. What the result of the race will be time alone can tell. Trump is not supposed to know the enhanced value of his property. It might be that the twfo men racing for the prize may, in their anxiety to buy the property, arouse his suspicions and that he would decline to sell for a nominal figure.

2 THE WHITE HORSE STAR, MARCH 13, 1901.

Shipyards are Busy.

At Dawson as well as at White Horse much work is being done in the repairing and remodeling of boats. There are many lower river boats on the ways near that city, several being remodeled to operate on the upper river next summer.

The White Horse Navigation Company will operate the Light, Tyrell and Lightning, the latter now being put in condition at the C. D. Co's ways below Dawson.

The Columbia Navigation Company, which owns the Pilgram. now on the lower river, and which lost the Sovereign during the storm at Nome last fall, will operate the Monarch, which now lies at steamboat slough in charge of Captain Leech, between Dawson and White Horse. The Monarch transhipped the American flag for the British, and made one trip to White Horse last fall. For two years previous she has been on the down river run

- **Arctic Restaurant and Hotel** (Bennett): 1899-1900
- - Wikipedia: "In July 1897 after hearing of the Klondike Gold Rush, Frederick (Friedrich) Trump, grandfather of American businessman Donald Trump, ... in April 1898 [incorrect - should be April 1899] moved to Bennett, British Columbia, running the Arctic Restaurant and Hotel, which offered fine dining and lodging in a sea of tents. The Arctic was originally housed in a tent itself, but demand for the hotel and restaurant grew until it occupied a two-story building. When describing the Arctic in a letter to the Yukon Sun newspaper, Trump wrote: 'For single men the Arctic has excellent accommodations as well as the best restaurant in Bennett, but I would not advise respectable women to go there to sleep as they are liable to hear that which would be repugnant to their feelings - and uttered, too, by the depraved of their own sex'. The Arctic House was one of the largest and most decadent restaurants in that region of the Klondike, offering fresh fruit and ptarmigan in addition to the staple of horsemeat."
- - opened May 1899 on the main street, in a tent with a wooden false front.
- - late 1899, a 2-storey wooden building was constructed.
- - December 1899, advertising "Fresh Oysters in Every Style. Elegantly Furnished Private Boxes for Ladies and Parties."
- - in the summer of 1900, the building was floated to a new site near the railway station.
- - January 1901, J. L. Gage prop. (*Whitehorse Star*, Jan. 2)
- - January 1901, Mrs. Gage was complimented for her hospitality by the passengers of a WP&YR train which was held up at Bennett from Sunday afternoon until Tuesday afternoon due to heavy snow (once the train left Bennett, it still took 18 hours to reach Skagway) (*White Horse Tribune*)
- - March 1902, still operating (*White Horse Tribune*, March 8)

Donald Trump's grandfather Friedrich Trump ran a restaurant, bar, and brothel in British Columbia.

By Natalie Obiko Pearson | October 26, 2016

Photographs by Ben Nelms/Bloomberg

Buried in a ghost town in Canada's subarctic are the roots of the family fortune that paved Donald Trump's path to prominence.

Only shards of glass bottles remain on the lake shore in Bennett, British Columbia—remnants perhaps of the lively establishment operated by Trump's grandfather that was known for good food, booze and ready women. A church sits further up the slope, its lonely spire peeking out from a thicket of pines.

Friedrich Trump, circa 1918.

Source: Wikipedia

Bennett was once a thriving transit point for prospectors in the Klondike gold rush at the turn of the 20th century, and Friedrich Trump made a killing running a restaurant and bar. The nest egg he generated in just two years grew into the fortune that has supported his grandson's bid for the U.S. presidency.

"Who else can say that someone running for president of the United States of America owes his fortune to your hometown?," says Scott Etches, 55, a shop owner hawking Trump t-shirts in Whitehorse, Yukon, about 100 kilometers (62 miles) north of Bennett. "It doesn't matter whether you support or oppose Trump. It's actually a great history."

More than a century after Trump's grandfather left the Yukon, Canadian developers and entrepreneurs are torn over whether to exploit the connection to one of the most recognized surnames on the planet. A luxury wilderness resort is planned for Bennett, complete with a lodge that would look just like Trump's watering hole.

"There's so much history, so many stories around here—Trump is just one of them," says Nelson Lepine, who runs the development arm of an indigenous group leading the project.

The Trump family's gold-rush story began when Fred, as he was known, left Germany at the age of 16 with little more than a suitcase. He headed to New York to work as a barber before venturing west in search of riches. Following stints in Seattle and now-defunct Monte Cristo, the gold fever carried him to Bennett, where he and partner Ernest Levin built the Arctic Restaurant, which touted itself as the best-equipped in town.

It was open around the clock with "private boxes for ladies and parties," according to an advertisement in the Dec. 9, 1899 edition of the *Bennett Sun* newspaper. The boxes typically included a bed and scale for weighing gold dust used to pay for "services," according to a three-generational biography by Gwenda Blair, who traced the origins of the Trump family's wealth. Of course, in the rough-and-tumble frontier towns of that era, the Arctic's business model built on food, booze and sex was common.

The Arctic sat a stone's throw from Bennett Lake in the heart of the township, amid a row of similar establishments and a sea of white canvas tents set up by prospectors. It was constructed of milled lumber and stocked fresh oysters, extravagant luxuries in a place where supplies were brought over arduous overland routes.

"I would advise respectable women travelling alone, or with an escort, to be careful in their selection of hotels at Bennett," according to a letter penned by "The Pirate" in the *Yukon Sun* on April 17, 1900. For single men, the Arctic offered excellent accommodations but women should avoid it "as they are liable to hear that which would be repugnant to their feelings and uttered, too, by the depraved of their own sex."

Trump quickly saw where the real profits lay amid the gold-rush frenzy. An estimated 100,000 prospectors set out for the Klondike, of which only a third actually made it, and a mere 4 percent ever struck gold. Given those odds, Trump's willingness to lay down his pick was "a shrewd move," according to Blair. "He was mining the miners."

Bennett was a key hub for prospectors, who trudged from Alaska across frozen mountains and floated rickety rafts down the treacherous rapids of the Yukon River to Dawson City in search of elusive gold. The town lost its allure with the construction of a railway link from Skagway, Alaska to Whitehorse, allowing miners to bypass Bennett.

In response, Trump dismantled the restaurant and its precious lumber and rebuilt it in Whitehorse. A photo in Blair's book shows a mustachioed Fred Trump in a white apron. He's standing at the bar near a wall of drapes behind which women, known as "sporting ladies," entertained miners in privacy.

Trump was a rich man when he left Whitehorse in 1901 to return to his native Kallstadt, Germany, where he later deposited savings of 80,000 marks in the village treasury, Blair recounts. Unable to regain German citizenship, he returned to New York with his riches. That amount—equivalent in purchasing power to about half a million euros in 2014—ended up funding the Trump family's first residential real estate investments in the New York area, later carried on by his son Fred and grandson Donald.

Trump, who claims in his memoir that his grandfather was Swedish, told the *New York Times* in August that Blair's portrayal of Friedrich's business was "totally false." Trump's spokeswoman, Hope Hicks, didn't reply to two voice mails and an e-mail requesting comment.

2017 (March 26) article - Trump's Grandfather Worked Under John D. Rockefeller, Uncle Translated Tesla's Stolen Work

See [HW0032][GDrive]

Before you trust a power player, read up on their history.

The history, family, and associations of a power player are essential prerequisite info, if a person truly wants to understand who they are and what they do

The history, family, and associations of a power player are essential prerequisite info, if a person truly wants to understand who they are and what they do.

Since we're forced to deal with President Donald Trump, let's take a look at what he was born into. He inherited millions of dollars from his US military affiliated real estate baron father, Fred Trump.

His uncle, John G. Trump, was an engineer working with the military industrial complex (https://themindunleashed.com/2017/01/institutes-technology-exposed-academias-role-war-science-system.html) affiliated school MIT, and examined brilliant engineer Nikola Tesla's stolen papers after his death.

Donald Trump's grandfather Frederick Trump (https://en.wikipedia.org/wiki/Frederick_Trump) was an immigrant from Germany to the US. Fred and John G. Trump inherited the foundation of their opportunity from Frederick.

Frederick Trump had problems with immigration in his lifetime, and was denied the ability to again become a German citizen, after fleeing to the US to dodge military service (not that there is anything wrong with avoiding serving in the military of a government you don't believe in).

At the age of 16, in 1885 Friedrich Trump landed in New York after emigrating from Kallstadt, Germany. He made a fortune (https://www.politico.com/magazine/story/2015/08/the-man-who-made-trump-who-he-is-121647) in the Pacific Northwest during the gold-rush era, selling restaurant rooms with prostitutes and alcohol to miners trying to find gold.

He worked under the direction of John D. Rockefeller's investment near Seattle in the last decade of the 1800's. According to an article by researcher Gwenda Blair published in Politico):

- *"Friedrich Trump's Seattle restaurant flourished, but he kept his ears open —another aspect of the Trump family MO. In 1894, he heard that John D. Rockefeller, the wealthiest man in the world, was bankrolling a mining operation in a small town north of Seattle named Monte Cristo. Without delay, Trump scoped out the best location there, secured it by filing a bogus mineral claim, built a hotel on the parcel even though it didn't actually belong to him, and began giving the customers, once again, exactly what they wanted: plenty to eat, lots to drink and of course women.*
- *When Monte Cristo proved slow to deliver on its promise, Rockefeller publicly reiterated his support while secretly arranging an exit. In the summer of 1897, Trump also decided to cash out and return to Seattle—making him, along with Rockefeller, one of the few investors in Monte Cristo to end up winners rather than losers."*

Although this doesn't imply any kind of close relationship between Rockefeller and Trump, it is telling in some way that they both made their fortunes in the same atmosphere. It paints a picture of where power today originates and how it inherently behaves.

Whether or not John D. Rockefeller had a relationship with Friedrich Trump, Donald Trump today has a relationship with Rockefeller's Standard Oil corporation, which is now ExxonMobil.

Donald Trump's Secretary of State is Rex Tillerson, ex-Exxon executive.

Continuing from the article:

- *"In the New Arctic Restaurant and Hotel, which he opened in the raw new town of Bennett in May 1898, he again offered 'private boxes' for ladies, facilities that included not only a bed, but a scale for weighing the gold dust used to pay for services.*
- *It was the best restaurant in town, one newspaper reported at the time, but added that it 'would not advise respectable women to go there to sleep as they are liable to hear that which would be repugnant to their feelings and uttered, too, by the depraved of their own sex.'"*

The story is continued by Wikipedia (https://en.wikipedia.org/wiki/Frederick_Trump):

"He bought all the necessary supplies, sold off his remaining property in Monte Cristo and Seattle, and transferred his 40 acres in the Pine Lake Plateau to his sister Louise. In 1900, Louise sold the property for $250. In the winter following Trump's departure from Monte Cristo, the town suffered some of the worst avalanches and #oods in its short history, and this time, Rockefeller refused to reconstruct the almost vital railroad to Everett."

The same author wrote another article in the Week (https://theweek.com/articles/580042/ancestral-immigrant-historyantiimmigrant-crusader-donald-trump), continuing the story into the 20th

Century. It says:

- *"Friedrich died in May 1918, just before the end of World War I. There was a rising tide of anti-German sentiment in America, manifested in accusations of disloyalty against people with German backgrounds, diatribes against music by German composers, even bon!res of books by German authors. People with German names changed them, and readership plummeted for the nation's hundreds of German-language publications.*
- *This xenophobic atmosphere had a profound impact on Friedrich's older son, Fred (named a"er Friedrich but in an Americanized form). Only 12 years old when his father died, Fred was now the man of the house, and he began to tamper with his family history — that is, to tell it like it wasn't. Despite growing up in a German-speaking home and speaking his parents' language on visits to Kallstadt, he said he didn't know German, and by the beginning of World War II, he said his family was from Sweden."*

So that brings us to Donald Trump's father, Fred Trump. When Fred Trump's father Freidrich died, 13 year old Fred became the man of the house.

By age 15, his mother helped him begin a career in building homes and real-estate, using the wealth accumulated by Freidrich: Donald Trump's father was given a more modest silver spoon than Donald, but a silver spoon nonetheless. With the inheritance from his father and his work in real estate, Fred Trump helped his brother John G. Trump enter academia.

Fred Trump became a millionaire working with the US Military in WWII, building barracks and apartments. According to Wikipedia (https://en.wikipedia.org/wiki/Fred_Trump):

- *"During World War II, Trump built barracks and garden apartments for U.S. Navy personnel near major shipyards along the East Coast, including Chester, Pennsylvania, Newport News, Virginia, and Norfolk, Virginia.*
- *After the war he expanded into middle-income housing for the families of returning veterans, building Shore Haven in Bensonhurst in 1949, and Beach Haven near Coney Island in 1950 (a total of 2,700 apartments). In 1963–1964, he built Trump Village, an apartment complex in Coney Island, for US$70 million."*

This is how Donald Trump was born into a position to create his own fortune, following his father into the real estate business with both his money and business connections.

The exact amount Donald received from his father to start his life is debated. Hillary Clinton (not that she is to be trusted or respected) claimed he received

$14 million.

Donald Trump claimed he received a “small” sum of $1 million to start, and other evidence suggests that he received other loans from his father. He also received a $1 million trust, as did his siblings. According to the Washington Post (https://www.washingtonpost.com/politics/2016/live-updates/generalelection/real-time-fact-checking-and-analysis-of-the-!rst-presidentialdebate/fact-check-how-much-help-did-trumps-father-give-his-son/?utm_term=.c4cca8f0b4bc):

- *“The casino document lists several other loans from Trump’s father to his son, including a $7.5 million loan with at least a 12-percent interest rate that was still outstanding in 1981.*
- *In a 2007 deposition, Trump admitted he had borrowed “a small amount” from his father’s estate: ‘I think it was like in the $9 million range.’”*

During the time that Fred Trump earned his fortune, his brother and Donald’s uncle John G. Trump was working with the mad scientists at Massachusetts Institute of Technology (MIT), de-coding brilliant engineer Nikola Tesla’s stolen papers.

MIT is a central hub of science for the military industrial complex, as we’ve scratched the surface of in past articles (https://themindunleashed.com/2017/01/institutes-technology-exposed-academias-role-war-science-system.html). Researcher and author Peter A. Kirby (https://www.amazon.com/Chemtrails-Exposed-New-Manhattan-Projectebook/dp/B007JDN7EM) thoroughly exposed the root of geoengineering (spraying the skies) in MIT, and his latest article can be found here (https://www.activistpost.com/2017/03/chemtrails-exposed-truly-a-new-manhattan-project.html).

John G.’s association to Tesla was summarized by Big Think (https://bigthink.com/paul-ratner/nikola-tesla-predicted-hillary-clintons-nomination-and-has-a-surprising-connection-to-donald-trump):

- *“A few days a"er Tesla died on January 8th, 1943, his possessions were seized by officials from the amazingly-named government* ***Office of Alien Property*** *. About 3 weeks a"er that, all of Tesla’s things and documents were given a thorough examination by a group of FBI agents that included none other than* ***John G. Trump****.“*

John G. Trump wrote about Tesla’s stolen papers, but perhaps his statement was meant to dissuade people from believing they found something of value in them, to keep the findings a secret. He said (https://bigthink.com/paul-ratner/nikola-tesla-predicted-hillary-clintons-nomination-and-has-a-surprising-connection-to-donald-trump):

Tesla’s “thoughts and efforts during at least the past 15 years were primarily of a speculative, philosophical, and somewhat promotional character,” but “did not include new, sound, workable principles or methods for realizing such results.”

More basic info about John G. Trump can be garnered from Wikipedia (https://en.wikipedia.org/wiki/John_G._Trump):

- *“During 1942, Trump became Secretary of the Microwave Committee, a subcommittee of the NDRC. The director of the Microwave Committee was Alfred Lee Loomis (https://en.wikipedia.org/wiki/Alfred_Lee_Loomis), the millionaire physicist, who decided to create a laboratory. He selected a site for it, chose a suitably discreet and ambiguous name for it and funded the construction, until the Federal administration was established. The new institution was the MIT Radiation Laboratory (https://en.wikipedia.org/wiki/Radiation_Laboratory_%28MIT%29), or the “RadLab”.”*

So what does this say about Donald Trump? One thing is certain: he is not new to the game of political power, to the military industrial complex, or to wealth.

He has never had a history of caring about our class of people, and he has fikked the White House with nothing but bankers (https://www.youtube.com/watch?v=FHNAZMIcFNg), oil barons and people who loot and pillage our class of people.

Just as Hillary Clinton or Barack Obama represented forces larger than them, from Goldman Sachs to the modern day incarnation of Rockefeller’s Standard Oil (ExxonMobil), all of them accept money and direction from the exact same entities.

It is purposefully dif!cult to differentiate who is against who in this powerstructure, but it’s safe to say none of them have our best interest at heart.

MERCHANTS HAVE DECIDED TO FORM A SINGLE BODY

AGREED ON AT MEETING OF THE RICHMOND HILL BUSINESS MEN'S ASSOCIATION.

WILL BRING GOOD RESULTS

Finally Plans Will Be Made at Tuesday Night Meeting—Many Other Things Taken Up By Members.

A plan that has been under consideration for some time by the Richmond Business Men's Association was put into effect at a meting that was held on Tuesday night in the store of A. Zang, 3111 Jamaica avenue. It was to stretch the territory of the organization to Woodhaven and accept the merchants of this section as members. When the plan was adopted, there was much cheering. Irving Tuthill, presided.

During this time it has been instrumental of the strongest of its kind in the city. It has been in existence for five years.

The Richmond Hill Association is one in bringing many needed improvements to the section. The members have taken part in every patriotic drive that has been held. They will march in the Memorial Day Parade. In the Liberty Loan Drive, the members succeeded in getting more than $16,000 in subscriptions.

The idea of taking in Woodhaven merchants was suggested by Chester D. Fiske three months ago. He has been working on the plan ever since. A delegation of Woodhaven merchants, headed by E. W. Bedell was present. They enjoyed the manner in which the members handle their business.

It was suggested that the name of the organization be changed. Action on this as deferred to the meeting on Tuesday night which will be held at the store of E. W. Bedell on Jamaica avenue near Manor avenue. Following the meeting a social hour was enjoyed.

The members have decided to again close their stores two nights each week during the months of July and August. The stores will close on Tuesday and Thursday night, promptly, at 6 o'clock. This is done so the employes as well as well as the employer, can have a chance of enjoying a little recreation. The first closing will be July 9.

Monte Cristo Mine -

https://en.wikipedia.org/wiki/Monte_Cristo,_Washington

"Kallstadt Germany gained international media attention as the ancestral home of the related Heinz and Trump families. Heinz is part of the extended family of the Trumps, a second cousin of Frederick Trump and second cousin twice removed of President Donald Trump."

"**Henry J. Heinz, the founder of the Heinz company, was the grandson of Charlotte Louisa Trump.**"

"Frederick Christ Trump (October 11, 1905 – June 25, 1999) Elizabeth Trump was born as Elisabeth Christ in Kallstadt, Kingdom of Bavaria, the daughter of Philipp Christ by his wife Anna Maria Christ (née Anthon)."

individuals with the surname Trump came to the United States in the 19th century, including Charlotte Louisa Trump's son Johann Heinrich Heinz, the father of Henry J. Heinz, the founder of the Heinz company. Henry John Heinz was born in Birmingham, Pennsylvania on October 11, 1844, the son of German immigrants John Henry Heinz (1811–1891), of Kallstadt, Palatinate, Kingdom of Bavaria, and Anna Margaretha Schmidt (1822–1899), of Kruspis, Haunetal, Hesse-Kassel. His father immigrated to the United States at age 29 in 1840, his mother at age 21 in 1843. They were married December 4, 1843, in Birmingham, Pennsylvania, on the south side of Pittsburgh, where they first met. Anna Schmidt was the daughter of a Lutheran minister; John Heinz was also Lutheran.

Henry J. Heinz, the founder of the Heinz company, was the grandson of Charlotte Louisa Trump of Kallstadt

- Johann Philipp Trump (1667–1707), married Juliana Maria Rodenroth
  - Johann Sebastian Trump (1699–1756), married Susanna Margaretha Kohl
    - Johann Paul Trump (1727–1792), married Maria Elisabetha Setzer
      - Charlotte Louisa Trump (1789–1833), married Johann Georg Heinz
        - John Henry Heinz (1811–1891), emigrated to the United States in 1840
          - Henry J. Heinz (1844–1919), founder of the Heinz company
      - Johannes Trump (1789–1835), married Susanna Maria Bechtloff
        - Friedrich Trump (died 1876), married Elisabetha Trump
        - Maria Katharina Trump (born 1827)
        - Christian Johannes Trump (1829–1877), married Katharina Kober (1836–1922)
          - Johannes Trump (born 1860)
          - Katharina Trump (born 1861)
          - Jakob Trump (born 1863)
          - Sybilla Luisa Trump (1865–1931), moved to New York City, the United States, married a German-born man named Schuster
          - Konrad Trump (born 1868–1868)
          - Friedrich Trump (1869–1918), barber and restaurant and hotel manager, married Elisabeth Christ, moved to the United States in 1885/1905
            - Elizabeth (Elisabeth) Trump (1904–1961), married William O. Walter
              - William Trump Walter (born 1931)
              - John W. Walter (born 1934), referred to as the Trump "family historian"[28]
            - Frederick Christ Trump (1905–1999), real estate developer, married Mary MacLeod (1912–2000)
              - Maryanne Trump (born 1937), federal judge, married/divorced David Desmond; married John Barry
                - David William Desmond (born 1960; of first marriage), psychologist
              - Frederick Christ Trump, Jr. (1938–1981), TWA pilot,[29] married/divorced Linda Clapp
                - Frederick Christ Trump III (born 1963) married Lisa Beth Lorant[30][31]
                  - a daughter (born c. 1992)[32]
                  - a son (born c. 1994)[32]
                  - William Trump (born 1999)[31]
                - Mary Trump
              - Elizabeth Joan Trump, married James Walter Grau
              - Donald John Trump (born 1946), real estate developer, 45th President of the United States, married/divorced Ivana Zelníčková; married/divorced Marla Maples; married Melania Knauss
                - Donald Trump Jr. (born 1977; of first marriage), married Vanessa Haydon
                - Ivanka Trump (born 1981; of first marriage), married Jared Kushner
                - Eric Trump (born 1984; of first marriage), married Lara Yunaska
                - Tiffany Trump (born 1993; of second marriage)
                - Barron Trump (born 2006; of third marriage)
              - Robert Trump, married Blaine Beard[33]
            - John George Trump (1907–1985), married Flora Sauerbrun (1913–1983)

CHAPTER SEVEN - BORN TO WORK

QUIETLY, POLITELY, AND FIRMLY, Frederick Christ Trump pushed his way into the back of a hot, packed courtroom on the afternoon of **Monday, January 15, 1934.** Surrounding him were dozens of anxious, frightened people who had recently discovered that they had lost their life savings. Small investors for the most part, they had found themselves left holding the bag in the biggest bankruptcy anybody could remember. Today, summoned by tiny-print newspaper ads, certified letters, and word of mouth, they had gathered at the Main Post Office Building in Brooklyn, which also served as the federal courthouse.1 Court officials had expected a quiet judicial proceeding. To their dismay, more than three thousand people showed up, overflowing the three-hundred-seat courtroom and clogging the marble-lined corridors and the stairwells. A front-page story in the next day's Brooklyn Eagle called it the largest courthouse crowd in borough history.2

To accommodate the mob of unhappy creditors, officials had propped open the heavy courtroom doors, which were covered in dark leather and studded with brass nails. It was cold outside and chilly on the floors below, but here the severe crowding made the area unpleasantly warm and stale with the smell of overdressed, sweating bodies. Only someone determined could have shoved a way inside. But twenty-eight-year-old Fred Trump, tall and slim, with a mustache and straight blond hair, was very determined.

Courtroom 727, a recent addition to the post office, was an elegant room with a twenty-foot ceiling, patterned marble floors, and large windows that looked west toward the Brooklyn Bridge and the East River. Rich mahogany paneling covered the walls, and terra-cotta wreaths and decorative molding festooned the ceiling. But on this mid-January day no one was paying attention to the decor. Some of the people seemed too dazed to speak and simply stared into space. Others talked incessantly in loud, angry voices. Often the conversations were in German or German-accented English.

Waiting for the proceedings to begin, these spectators were outraged and vulnerable, equally ready to lash out in fury or burst into tears. The Depression had already lasted more than four years. It had long since taught them the cruel lesson that no job was safe, that a factory with production lines working double shifts one week could close the next, and that if you couldn't pay the rent, you were on the street even if you had no place to go. But through the stock market crash, the unemployment lines, and the bank holidays, this group had clung to the apparent stability provided by a handful of corporate enterprises based in downtown Brooklyn and run by a German-American family called Lehrenkrauss.

Known as the House of Lehrenkrauss, this family conglomerate had begun back in 1878, twenty years before the city of Brooklyn merged with Manhattan. In a tiny closet in what was then Brooklyn City Hall, Julius Lehrenkrauss, a recent German immigrant, opened a travel bureau that sold steamship tickets to other Germans who wanted to bring their families to America. Because transferring funds abroad was a complex affair, he became his clients' de facto private banker, holding their money, sending funds overseas, making investments on their behalf.3 As Germans continued to pour into the United States, the Lehrenkrauss operation expanded to fill a five-story building across the street from Borough Hall, as the old City Hall was renamed after Brooklyn was incorporated into New York City in 1898. In addition to the travel agency and private merchant bank, the business now included a safety deposit box department, an insurance company, and mortgage brokering.

After World War I Lehrenkrauss developed a brisk trade in what was known as "guaranteed" or "certificated" mortgages. To pay for the residential properties going up all over New York City, mortgage banks and title companies began to "certificate" mortgages—that is, to divide them into shares that were then sold to the general public like so many bonds. Available in denominations of $1,000 and up, these certificates appealed to people who wanted to cash in on the economic bonanza of the 1920s but had little money to invest. Although mortgage certificates would never create the overnight windfalls of the stock market, they returned a guaranteed 6 percent interest at a time when banks paid only 3 percent and were not insured by the federal government.4

In the early 1930s, as the nation plunged into economic turmoil, certificated mortgages from Lehrenkrauss appeared to retain their value. The firm, now headed by Julius's son, also named Julius, held $30 million in Brooklyn and Queens mortgages, had forty thousand regular customers,5 and maintained five branch offices around the city as well as correspondents in more than a dozen European cities.6 Modest wage earners who had turned over their little nest eggs to Lehrenkrauss remained secure in the knowledge that on the first of every month an interest check would arrive in their mailboxes.

But on December 1, 1933, Lehrenkrauss investors reached into their mailboxes and found them empty.7 The fifty-five-year-old House of Lehrenkrauss had crashed to the ground, apparently without any warning whatsoever. Soon screaming headlines in the Brooklyn Eagle revealed that Julius Lehrenkrauss had been running a deficit operation for years, covering expenses and salaries with a haphazard assortment of schemes that included issuing watered stock

been running a deficit operation for years, covering expenses and salaries with a haphazard assortment of schemes that included issuing watered stock, writing up mortgages based on either inflated or nonexistent evaluations, selling mortgage certificates worth more than the mortgages they represented, and taking out bank loans against mortgages that had already been certificated.8 When the Depression caused the mortgage market to contract, the Lehrenkrauss operation lost its cash flow—the constant inflow of new dollars that kept it afloat—and ended up drowning in a sea of financial obligations.

By law, bankruptcy falls under federal jurisdiction and regulations. Accordingly, Lehrenkrauss's creditors had gathered at the U.S. District Court for the Eastern District of New York—in other words, the federal court in Brooklyn—to exercise their legal responsibility. As most of them were learning for the first time, they were not only entitled, but actually obliged to meet and elect trustees who would parcel out the company's remaining assets. Shortly after two, a man in his mid-thirties who had a mustache and wore his thick brown hair plastered down and parted in the middle called the meeting to order. His name was Theodore Stitt, and he was the court-appointed referee in charge of the Lehrenkrauss bankruptcy case.9

After the crowd settled down, Charles J. McDermott, a prominent retired judge in his late sixties, began speaking. For the past six weeks he had been working on this case as a receiver, an interim official whose job was to inventory assets as bankruptcy proceedings unfolded. Standing in front of the room, he wasted no time getting down to business. The affairs of the House of Lehrenkrauss were so tangled, he said, that it was impossible to give even a general status report.10

To disguise the firm's dire straits, Julius Lehrenkrauss had ordered the accountant to cook the books. Thus, for example, one division's $19,000 deficit had magically turned into a net worth of $1.8 million.11 Julius regularly made out corporate checks to cash, with no accounting for where the money went. Whenever he could get away with it, he paid dividends by issuing more worthless Lehrenkrauss stocks. He left dozens of deeds unfiled, misfiled, and, in some cases, missing altogether. As a result, almost all McDermott could say was that the Lehrenkrauss bankruptcy was "the most interwoven, intricate and hopelessly muddled-up mess that I have ever had anything to do with."12

"Appoint a trustee!" shouted one creditor in the mob.

"Who stole the money?" yelled another. "Put them in jail!"13

At this point, a short fat man with thick gray hair and a cigar stub in his hand stood up in front of the room. Archibald Palmer, a lawyer, had devoted his career to bankruptcy cases, a field that made up for its low prestige with handsome fees. Now in his forties, he had trained as a bantamweight fighter and was well-known for his combativeness in the courtroom. "I have to be punching all the time, even if I get licked," he once said.14 Speaking on behalf of the creditors, he charged that family greed had caused the Lehrenkrauss downfall. The final collapse had turned into disaster and disgrace, he thundered, because of Julius Lehrenkrauss's unwillingness "to face the music" when financial ruin was inevitable. "He was looking for a miracle," Palmer said in a ringing voice. "God doesn't send miracles to bad people."15

The crowd applauded wildly when Palmer reported that police had recovered mining stocks that Julius had pocketed, but the lawyer quickly discouraged their jubilation. "Applause won't do you any good because they owe you so much money," he said, adding that the restored stock "would be of as much consequence as one wrinkle more or less on an old lady's face."16 Indeed, he said, "in this muddle we are doing a public service if we can salvage anything at all and more than anything at all from this mess."17 The press, he declared, had covered only a small fraction of the "dirt and filth" involved, for it would take four newspapers to cover all the crimes committed.18

Unlike everyone else in Courtroom 727, Fred Trump could not have been happier. The eldest son of Frederick Trump, he was well acquainted with the intricacies of New York real estate. As he stood and listened, he became increasingly interested in one particular Lehrenkrauss operation, the mortgage-servicing department. For a small fee, J. Lehrenkrauss & Sons, the core company of the Lehrenkrauss conglomerate, had managed the buildings on which it held mortgages, providing maintenance, collecting interest, paying taxes, and handling routine administrative matters. Because this operation was still making money, court-appointed officials would sell it off to satisfy claims. Presumably it would continue to make money for the buyer. Better yet, it could lead to far greater profits in the future. To the knowledgeable observer, the list of mortgages maintained by the company could be a gold mine, for it identified hundreds of properties that in these Depression times were liable to foreclosure and subsequent auction at tax sales.

After the Lehrenkrauss hearing, the young observer boarded the elevated train out to Woodhaven, Queens, where he lived with his widowed mother. Riding past the old Lehrenkrauss building at the corner of Fulton and Myrtle, now dark and shuttered, he pondered how to proceed. It could be risky; he had learned firsthand that building had its down periods. And with such high stakes, there would be serious political, legal, and financial infighting. But he had already made his decision.

***

If Elizabeth Christ Trump had gotten her way, her son Fred would never have been in that Brooklyn courtroom, because he would never have been in America. But in July 1905, after her husband was unable to regain German citizenship, he, Elizabeth, and their one-year-old daughter returned to New York aboard the SS Pennsylvania. Three months later, on October 11, one day after her twenty-fifth birthday, Elizabeth gave birth to her second child and first son. His name on his birth certificate was Frederick Christ Trump, but he was known as Fred from the start.

The newborn's parents had set up housekeeping at 539 East 177th Street. It was next to the recently electrified Third Avenue elevated train and not far from the Westchester Avenue apartment where they had lived with the Schusters.19 The new neighborhood was quiet, but because the building had been built under old zoning laws, the Trumps had only cold water and shared a bathroom with their neighbors. Two years later they had a third child, John George, and moved about fifteen blocks south to a spanking new five-story brick building on a corner lot in a newly developed section named Woodstock. There were six families on each floor and porcelain washbasins, bathrooms, and iceboxes in each apartment. Because they were on top of a hill, there was also a view out over the South Bronx. A dumbwaiter conveyed coal and wood to each apartment from a storage bin in the basement.20 A large farm at 152nd Street and Prospect Avenue provided fresh vegetables to the whole neighborhood, and a nearby Chinese hand laundry did the wash.21

After his return from Germany, Frederick Trump dusted off his barber tools and supported his growing family by giving shaves and haircuts. At first he lathered and snipped at home in the Bronx, but within a few years he had rented a room at 60 Wall Street, a large office building in lower Manhattan, and hired a tonsorial staff.22 The chairs in his shop were seldom empty, for the modern safety razor was not yet in general use, and being shaved by a barber was part of any successful businessman's daily routine.

But Frederick Trump was no more content to remain a barber now than he had been back in Germany two decades earlier. He worked, he saved, and he searched for a spot where a quick, energetic fellow who'd already knocked around the globe a bit could use what he'd learned, where things were still open and there was a chance to get in on the ground floor. His sister Katherine would move back to Manhattan, where her husband, Fred Schuster, would continue a succession of low-paying clerk jobs. His other sister, Louise, would marry an older, well-to-do Schuster cousin, George, and move north of the city to Mt.

Vernon. But Frederick Trump was still looking for the right opportunity for himself and his nest egg. By the end of 1906 he had found it. He was ready to stake his future on the growth of a section of western Queens called Woodhaven.

Before doing so, Trump made one last stab at returning to Germany. On December 20, 1906, he wrote again to the Royal Ministry of the Interior. Unlike previous unctuous missives, this letter was brief and to the point. He said that his life in America had been good and he had never intended to return to Germany, but his wife was unable to adjust to the New World. He did not emigrate to avoid military service, he said, but because he wanted to have "a profitable life" and to support his mother. He was "a quiet, peaceful man," and his family was of a high moral character. The flowery closing of the previous pleas was reduced to a perfunctory "Obediently."

In short order, the answer came back. The Royal Ministry was sticking to its guns. In a resolution dated January 10, 1907, the crown proclaimed him unwelcome as a resident in Bavaria. On March 13 the mayor of Kallstadt informed the Royal Ministry that he had given the required notice to this effect to Katherina Kober Trump and to Elizabeth's father, Philip Christ. Two days later, on March 15, Frederick Trump opened an account at the Hillside Bank, a new institution on Jamaica Avenue in Queens. He had stopped looking back. His future, and that of his family, would not be across the Atlantic Ocean in Germany, but across the East River in Queens.

It was hardly a wild gamble. As the rest of the city had urbanized, Queens had remained "the cornfield borough,"23 a source of fresh produce and unspoiled countryside. As a result, although it was the largest borough in terms of land area, it had by far the smallest population, just 152,999 inhabitants, or 4 percent of the city's total, in 1900.24 In large part this was because Manhattanites could reach the borough only by ferry or via Brooklyn. But now the city was building the Queensboro Bridge over the East River, and the Pennsylvania Railroad was digging a tunnel under it. When they were finished, Queens would be as accessible as the South Bronx. Surely, Frederick Trump reasoned, the real estate development that had occurred in the rest of the city would then touch Queens, creating opportunity for people like himself.

In September 1908, nine months before the completion of the Queensboro Bridge, he made his move, beginning the family's New York holdings by purchasing a modest two-story frame structure in Woodhaven. It was on the north side of Jamaica Avenue, the Indian track that had served as the main east-west road across Long Island for more than two centuries. The first acquisition in a real estate portfolio that would expand manyfold over the next century, the building was in an area called Union Terrace in honor of a nearby racetrack, now gone, named Union Course.25 In choosing this site, Trump had, as in his northwest ventures, followed the primary rule of real estate: Location, location, location. With an electric trolley that ran down the center of Jamaica Avenue, this site was perfect for business. But his purchase violated real estate's second rule: Never use your own money. He paid cash.

The next year the fledgling real estate magnate got a job as a manager at the Medallion Hotel, on the east side of Sixth Avenue at 23rd Street. The Medallion was one of many prosperous, thoroughly German business establishments in New York, and its majordomo was a champion sharpshooter named Gustav Zimmerman who was from Baden and lived near the Trumps in Morrisania. He saw in Frederick Trump the experienced hand he needed at the newly renovated hotel, which had just obtained a liquor license and was expanding its restaurant and bar operations. As always, the restaurant and hotel business meant long hours, made longer by the task of getting the new operation up and running. Frederick Trump spent most of his time at the hotel, and in the fall of 1909 he cast his vote in the city's mayoral elections from that address.26

By 1910, however, he and his family were in Queens. After a few alterations, the Trumps moved into the building on Jamaica Avenue and rented out one floor to another barber and his family. Unfortunately the building was not well suited for housing. All day long Jamaica Avenue rang with the noisy clamor of commerce, including busy workers rushing to and fro and knickered boys hawking newspapers. The trolley roared deafeningly outside the windows, and Elizabeth worried about letting her young children outside to play. After months of fretting, fretting, Frederick Trump moved his business a few blocks farther east on Jamaica Avenue and bought a nearby house and vacant lot next to it. Located just south of Jamaica Avenue on First Street, the new Trump residence, a two-story frame dwelling, was in the middle of what had been Union Course, and the neighborhood was often referred to by that name.

Unlike the family's previous address, this section was a quiet enclave, dotted with Queen Anne–style homes. The streets were unpaved and ungraded, the potholes so huge that a twelve-year-old girl supposedly fell into one and almost drowned just a few blocks from the Trumps' house.27 Aside from such perils, though, First Street in 1908 was a wonderful playground for Elizabeth, now eight, as well as five-year-old Fred and three-year-old John. Every evening until twilight, they played tag on streets that still had few cars. It was time to go home when the lamplighter came and reached his long pole up to the wick of the gas lamps.28 Up First Street and across Jamaica Avenue was P.S. 97, the red brick elementary school all three children attended.

In winter they ice-skated and rode sleds on the golf course at nearby Forest Park; in summer they played games like ring-a-levio and cat, in which one team hit a stick up in the air and then tried to get to bases before the opposing team retrieved the stick. On Halloween boys turned their jackets inside out, scrawled on them with chalk, and then whacked each other with socks filled with flour.29 A few days later, on election night, families went to Forest Park and huddled around huge bonfires as the local newspapers projected results on special screens. Four weeks later, on Thanksgiving morning, children would dress as ragamuffins and go from door to door collecting fruit and candy before returning home and tucking into turkey.30

Such pleasant conditions ensured the borough's rapid growth.31 Between 1910, when the bridge was finished, and 1915, Queens's population increased 40 percent.32 Land prices soared, nearly all of the borough's remaining farms quickly disappeared, and builders, most of whom worked on a small scale, began constructing one- and two-family homes and small apartment buildings.33

Frederick Trump had high hopes for the future, for he had his own savings to invest as well as possible funds from his sister Louise, who had backed his real estate ventures in the West. Weekday mornings he would walk the few blocks to his office, dressed, as was customary for businessmen at the time, in a spotless boiled white shirt, formal tie, and three-piece tailor-made gray suit. Often he stopped at a little two-room building across the street to visit Carl Louis Voeller, a first-generation German American who was fluent in German and English and specialized in second mortgages. Although Frederick Trump had now spent more than a quarter of a century speaking English, he preferred German and did considerable business, including his own will, with Voeller.34

Doing business in German was hardly unusual in Queens. As of 1900, one in four New Yorkers was German or of German ancestry, which added up to the world's second largest population of Germans after Berlin.35 Queens was especially especially Teutonic, and along Jamaica Avenue German was at least as common as English. A few blocks from the offices of Trump and Voeller was the Triangle Hofbrau, a center of local gemütlichkeit. The restaurant's wooden barrel heads came from Neustadt, a village only a few kilometers from Kallstadt, and carvings across the front boasted of wine from the Pfalz.36 Like many of their neighbors, the Trumps used German at home, and their children did not use much English until they went to school.37

Frederick Trump was working on Jamaica Avenue at a time of almost inconceivably rapid change.38 When he arrived, Long Island farmers still traveled the old road, taking produce to Manhattan at night in horse-drawn wagons. By 1915, though, the weeping willows and chestnuts that had lined Jamaica Avenue were gone, replaced by mounds of dirt from the construction of the elevated train. The farmers' highway had become an urban landmark, a gloomy tunnel-like passageway on which the sun never shone and over which the elevated now roared with an unabated clatter.

With this enclosure of the old plank road, yet another wave of suburbanization ensued, bringing development and subdivision to the farther reaches of Queens.39 In keeping with the borough's new, modern profile, Queens adopted a street-labeling system known as the "Philadelphia grid." Gone were Suydam, Shaw, and other references to the Dutch and English inhabitants whose farms once covered Queens. Gone also were other plain but familiar street names, replaced by sequential numbers. The Trump home, originally 154 First Street (also known, in an era more familiar with Latin, as Unum Street), became 154 87th Road, amended later, as lots subdivided, to 1540 87th Road.

But the greatest changes occurred in August 1914, when World War I erupted. Americans were neutral at first. As time went on, though, they lined up with the British and against the Germans—and, inevitably, against German-Americans. On May 5, 1915, a German submarine sank the Lusitania, a British liner sailing under a U.S. flag. All 1,200 passengers died, including 124 Americans. So did any remaining American neutrality.

Well before the United States officially entered the war in April 1917, the country yanked up the wilkommen mat for what was now perceived as the domestic Hun. The German music that had filled concert halls and opera houses vanished. Cities with German names changed them. Ground meat, formerly called "hamburger," became "Salisbury steak," patties made from it turned into "Wilsonburgers" and "liberty sandwiches," and "sauerkraut" became "liberty cabbage." More than a dozen states summarily dropped German instruction in school, and others severely limited it. German-language newspaper editors and advertisers received threats, postal workers misdelivered their publications, and Boy Scouts burned German papers in huge public bonfires. Teddy Roosevelt, the former president who had originated the notion of the hyphenated American, now denounced anyone who qualified. President Woodrow Wilson banned German males over fourteen from all boats other than ferries as well as airplanes, balloons, and all areas of military import, including Washington, D.C. The government also ordered six hundred thousand German aliens to register with local police and not to change residences.40

Unlike their neighbors, the Trumps did not change their name. Theirs had always been a German-speaking household, and so it remained. Hunkering down to avoid suspicion, Frederick Trump and his sister Katherine stayed in contact with their Kallstadt relatives, and after the war was over, Katherine Trump Schuster and her daughter Elizabeth went back to Kallstadt for a visit.41 But the bitter experience of having been tarred by their German ancestry had left scars on the Trump children. Years later, the older son, Fred, would quietly promote the notion that the family was actually Swedish.

The American Trumps survived the war, but they did not escape tragedy from another source: Blitzkatarrh, or influenza. At first the number of influenza deaths in the spring of 1918 set off no alarms, for people died of influenza and pneumonia every spring. Without a public health network continually coordinating national statistics, it was impossible for the medical community to know that fatalities were higher than usual, much less that one of the most fearsome epidemics in history was about to cut down millions around the world.42 The cases seemed to divide into two types, both fatal. Those who were sick for up to ten days or so before dying developed classic pneumonia, in which the normally whisper-thin membranes of the lungs become thickened, inelastic, unable to do their vital work of cleaning the blood of poisonous gases and providing it with oxygen. But those who died within only a day or two after the first sneeze had lungs full of a terrifying watery red liquid that poured out of the body and turned whole mattresses red.43

One Wednesday at the end of May 1918, Frederick Trump and his older son strolled down Jamaica Avenue. It was the eve of Memorial Day, and Fred, who was eleven, was delighted to honor the U.S. Civil War dead if doing so meant staying home from school. The next day there would be a big parade along this same street, and Fred could hardly wait. He and his father were doing what they often did in the afternoon, stopping in to chat with half a dozen realtors in the small storefront offices that now dotted Jamaica Avenue.

As Fred Trump recounted it many years afterward, his father turned to him and said he felt sick. They walked home, and the older man went to bed. "Then he died," Fred Trump said later. "Just like that. It seemed so sudden to me." At first, he said, he couldn't believe that as the parade was marching down Jamaica Avenue, his father was lying dead upstairs. "It just didn't seem real," he said. "I wasn't that upset. You know how kids are. But I got upset watching my mother crying and being so sad. It was seeing her that made me feel bad, not my own feelings about what had happened."44

The cause of death was listed on the death certificate as "pleno pneumonia, dextra et sinistra": full pneumonia, right and left lungs. Five days later, infected lungs caused the death of Frederick Trump's brother-in-law Fred Schuster. To the Trumps, it seemed a sad coincidence. By the end of the summer, though, it was clear that both men had almost certainly been early victims of what came to be known as "Spanish influenza." Ultimately, the influenza epidemic of 1918 claimed twenty-one million lives—six million more than all of World War I.45

***

Five and a half years later, on Tuesday evening, January 30, 1923, Frederick Christ Trump stood in the auditorium of Richmond Hill High School. Looking self-conscious in his formal attire, the thin blond youth marched into the hall to the strains of Mendelssohn, listened to the valedictorian expound on "Investment of Our Heritage," received his diploma, and marched out to Sousa's Washington Post March. He was through with his formal education.

Richmond Hill High, the largest in Queens, was about two miles from Woodhaven. Founded in 1898, it was one of the first tangible rewards Queens received for its incorporation into New York City. In a grand gesture, city officials had laid a cornerstone containing a set of U.S. coins, an engraving of the battleship Maine, and a portrait of Admiral Dewey and his fleet. Unlike a modern high school, this one had no cafeteria; students went home for lunch, brought their own, or ate in a diner attached to the school. But the school did boast a domed observatory, the only one in a city high school, and a brand-new $6,000 telescope. In the early years school life centered around the German club—Der Deutsche Kreis—and social events often featured German games, dances, songs, and readings.46 However, by 1918, the year Fred Trump entered Richmond Hill, the school had become Anglicized and German was rarely spoken.

Because there was little truancy and no vandalism, students did not have individual lockers. They simply left their coats and supplies in a coatroom, and apparently nothing was ever stolen.47 Rules were strict. There were no makeup tests, which meant that no matter how sick they might be, students either showed up for final exams or repeated the course. Teachers still scrupulously followed the classical curriculum, and the school papers bristled with literary allusions and Shakespearean wordplay.48 There were a few black students and a handful of Jews, but for practical purposes the school was white and Christian, with a Protestant majority.

Everything seemed to suggest that Queens would continue to grow and to improve, but not to change. Indeed, in many ways the area was still a nineteenth-century enclave. Some residents made forays into Manhattan, to see jazz at Gray's Drugstore or the Pennsylvania Grill or take in plays on Broadway. But most saw that borough, known throughout Queens as "the City," as a foreign land, distant and intimidating, and preferred to stay put amid traditional suburban familiarity.49

In early June, on Anniversary Day, the community celebrated its own existence.50 Local schools and businesses closed. Parents dressed children in white and decorated baby carriages. Here and there, groups got up a small float for the occasion. People congregated at their churches, joined an informal parade through the streets to Forest Park, and then circled back to the churches for ice cream.51 It was a glorious occasion, a moment to look around and savor a way of life so innocent and pleasant, it seemed that it would never end.

But it did. Economic development, population movement, and growth would inexorably change the face of all of New York City. As new businesses opened, new people would arrive. When Frederick Trump had come to America, he had naturally headed for the tenements of the Lower East Side and then out west, where opportunity was beckoning. But now new arrivals to New York, often from other parts of the United States, wanted to stay in the city and to have their own homes. As Fred Trump came of age, he saw an opportunity for himself in providing them.

***

When Frederick Trump died, his estate included the family's two-story, seven-room home in Queens, five vacant lots, $4,000 in savings and life insurance, $3,600 worth of stock, and fourteen mortgages. The net value was estimated at $31,359, the equivalent of about $345,000 in 1999 dollars.52 He had come from nothing, and he had left something for his wife and children. Had he lived, he would probably have left much more. But he had accomplished a great deal in the time that he had. Above all, he had redirected the course of his life and that of his family and the descendants who would follow. Instead of being German, part of the Old World and the old order, they were American, in place to assume leading roles in the century now unfolding. By establishing his family in Queens and becoming involved in real estate, he had set the stage for what was to come.

Unfortunately his financial legacy quickly diminished, consumed by the drastic postwar inflation of 1919–20, during which consumer prices spiked up more than 50 percent. His small but thriving real estate business shrank to its outlines, forcing the family to scramble. As it turned out, his widow had a remarkable talent for doing just that.53 Beginning with the lot next door to her home, she arranged for a local contractor to build houses on the empty property remaining in her husband's business, sell the houses, and provide home mortgages to buyers. For the time being, she would support her family with the income from the mortgages and whatever she could make by taking in sewing. Then, when her children finished school, they would continue the family business. Her older son, Fred, then fifteen, would be the builder; her younger son, John, thirteen, would be the architect; and her daughter, Elizabeth, sixteen, would run the office and keep the books.

Everything seemed to go according to her plan. Young Elizabeth left high school early, not an unusual step at that time, and enrolled in secretarial school. John busied himself with his schoolwork. Fred, who would have been happy to drop out of school, complied with his mother's request that he obtain a diploma, but he did not let being a full-time student interfere with getting the head start he craved.54 While classmates belonged to school clubs and played on sports teams, he earned money caddying at the local golf course, whitewashing curbstones, and delivering groceries and papers to his Woodhaven neighbors.

For as long as he could remember, he had been drawn to building, partly out of respect for his father, but also because it seemed like the most interesting thing in the world. "I always wanted to be a builder," he said years later. "It was my dream as a boy, just as some kids want to be firemen." Now he took night courses at the local YMCA in carpentering and reading blueprints, and he studied plumbing, masonry, and electrical wiring in correspondence courses. He also built a garage for a neighbor. "Probably not the greatest garage ever put up," he later acknowledged, "but the experience reinforced my hope of doing something creative with wood and bricks and cement."55

He did not study any more than he had to. Unlike his younger brother, John, an excellent student and a member of his high school honor society, Fred Trump settled for average marks. He had no time to study, much less to practice the violin that sat gathering dust in his room. The yearbook entry under his name says simply "X"; he had no extracurricular activities. Next to his name appeared the phrase "Even the good Homer sometimes nods his head in sleep," presumably referring to Fred's exhaustion after working and attending night classes.

As soon as he graduated, he obtained full-time employment in construction. His first job was as a "horse's helper" for a local builder. At the time, horse- and mule-drawn delivery wagons hauled construction materials to building sites along streets paved with flat wooden blocks fitted tightly together. The smooth surface meant easy travel in warm months but disaster in winter, when ice sheeted the roadway. On level ground the animals slipped and slid, and on hills they could not move at all.56 To keep Queens from closing down altogether, strapping young men like Fred Trump had to pull the loads themselves. "I replaced a mule," he said later.57 Every day he towed lumber up steep hills too icy for horses to ascend safely and thought about the fact that those high school classmates who had pursued business courses were making $35 a week compared with his $11 paycheck.58

He got work as a carpenter and took courses at Pratt Institute in Brooklyn in engineering, estimating, and other construction-related subjects. "I learned how to frame walls more efficiently than other people, how to read a blueprint more accurately and faster," he said years later. "They weren't huge skills, but they gave me an edge. It meant I could offer something different, something the others couldn't offer."59 He learned his craft well. Within two years of his graduation he had built his first house, a simple one-family home in Woodhaven, and then two more in Queens Village.

The financial end of the operation was more problematic. Because he was still under twenty-one, his mother incorporated the business, known as E. Trump & Son, and signed checks.60 A more difficult hurdle was inadequate sources of credit. Even before the Depression, small-scale builders like Fred Trump had little access to what are known as "construction loans"—essentially the temporary bank loans used to cover architect fees, materials, and other construction costs.I The only place they could borrow money was from moneylenders who crowded the sidewalks across from Brooklyn's Borough Hall year-round, rain or shine. Known as "the Court Street boys," they had deep pockets and offered financing on a handshake. Their customers included the major developers of the day, whose office buildings lined Court Street and were beginning to fill lower Manhattan. But the interest rates charged by the Court Street boys went well into the double digits, far more than Fred Trump could pay.

Instead he contrived his own financing. He began one house, sold it before he had finished it, then used the money to get a second one going while finishing the first, constantly stretching funds to cover the costs that just as constantly threatened to overtake his fledgling operation. He worked from dawn to dusk. He raced the payment clock. By 1926, three years out of high school, he had managed to put up nineteen more homes in Hollis, another Queens neighborhood.

Ceil Raufer was a new bride when she and her husband bought one of these houses from Fred Trump in July 1926 for $7,500. Their house was one in a row of seven detached frame dwellings he built on 199th Street. Obviously designed by the same hand, all had two stories plus an attic and a basement, a driveway to the side, and a garage in the back. Yet each had distinct details: three windows across the second-floor front, three little steps leading up to the front door, a dormer, an asymmetric bit of cornice, a decorative touch on a front porch.

"Fred Trump was too young to be at the closing, so his mother came," Raufer recalled years later. She knew that her house was in the builder's first development, but she had no qualms. Raufer knew the family, as her younger sister had been a classmate of John Trump's in elementary and high school. More important, she was impressed by Fred Trump's attentiveness to his customers. "He used to come around all the time and ask if I needed anything," she said. "Once he connected something in the kitchen so I could turn on the hot water all the time. He always said, 'Don't tell the neighbors, but I'll do it.' "61

All over Queens, groups of Fred Trump's homes began to appear. With each cluster, the houses were a little larger and a little better designed. In part, this

was because the Trumps learned firsthand of any shortcomings. After the mid-1920s the family became real estate gypsies, living in a succession of Fred's own newly finished houses all over Queens. As Elizabeth Trump had planned, her daughter worked as a secretary, for an import-export firm. John worked at General Electric and, with some help from his brother, began studying architecture at Brooklyn Polytechnic Institute. But he soon found that working with his older brother was not easy. To Fred Trump, building was a business proposition that required selling each house as soon as possible, regardless of its state of completion, in order to get enough capital to start the next one. To John, building was an aesthetic act that meant finishing each house down to the final touches before putting it on the market. Over and over the older brother prevailed, and John became increasingly disenchanted. By the end of his freshman year he departed from his mother's script and switched his major to engineering.

In June 1929 the younger Elizabeth Trump, then twenty-five years old, married William Walter, thirty-five, a tall, dark-haired bank trainee. His parents came from Germany, and his father, like Elizabeth's, had been a barber. The newlyweds moved to another of Fred Trump's Hollis homes, an expanded version of Ceil Raufer's house with everything nicer, bigger, and better made. Fred Trump, just twenty-three, had already built scores of residences and had hundreds of satisfied customers. Now he was carving lar**ge building lots out of the undeveloped sections of Jamaica Estates, a rolling, wooded area near the Long Island border.62 Seeing an increase in demand for high-priced homes, he planned to build what he called "authentic architectural reproductions" of English manor and Georgian Colonial dwellings in stone, stucco, and brick. They would have up to five bedrooms and four bathrooms and sell for as much as $30,000**.*63*

Frederick Trump's sisters, Louise Trump Schuster and Katherine Trump Schuster, remained oriented to Manhattan. Both were widows, and their lives revolved around the Glad Tidings Tabernacle, a modest Pentecostal church in the Hell's Kitchen neighborhood of "the City." Geographically the parish was only a borough away from the Queens Trumps. But sociologically and economically, Glad Tidings, with its butchers and bakers, its mail carriers and store clerks, was light-years removed from the bankers and lawyers who came to live in Jamaica Estates.

But the Trumps did stay in touch. Louise and Katherine and their families came to dinner now and then, occasions Katherine's grandchildren remembered fondly years later because of Tante Elizabeth's excellent cooking and, especially, her apple torte. In the summer there were family outings to North Beach, to the fairgrounds and dance pavilions, later replaced by LaGuardia Airport, where German oompah music still rang out. Frederick Trump's children never met his mother, Katherina Kober, who died in Kallstadt in November 1922 at the age of eighty-six, shortly before Fred's graduation from high school. But they accompanied their own mother on a trip to Germany in 1929, just before the Depression made such journeys an impossible luxury.

That October, the stock market crashed, signaling the end of good times. Fred Trump kept putting up mock Tudor mansions, but the real estate market was drying up. The inflationary 1920s had been forgiving times, particularly in real estate; eager to clinch deals, banks had been willing to embrace chancy ventures because any cost overruns could be recouped in a seemingly ever-expanding economy. In the deflationary 1930s, though, banks became allergic to even modest risk taking. Almost no one could obtain capital. Abandoning residential real estate, Trump opened a food market in Queens. He modeled it on King Kullen, a new store a mile away. Unlike the old German-style markets, where customers handed a shopping list to a clerk and waited for it to be assembled, here they could walk around and select cans from the shelves and precut meat from a refrigerator refrigerator case.64 It was one of the first modern supermarkets in the city.

To attract customers, the erstwhile builder placed ads for Trump Market in local papers and published his own broadsheet advertising special bargains. But when his staff told him they could arrange his store better than that of his competitor, he told them not to bother. "I don't want to do it better than King Kullen," he said. "I just want to do it just as well."

What could have been a new career was only a stopgap for Fred Trump. He wanted to build, not manage.65 It was the only time in his life that he did not put his utmost into what he was doing. His heart was in real estate, not refrigerator cases. The whole time he was running the supermarket, he kept looking for a way to return to his first love. With some energetic maneuvering amid the ruins of the House of Lehrenkrauss, perhaps he would be able to leave the grocery store behind.

- *I. Upon completion of a project, such loans, usually from commercial banks that lend on a short-term basis and at a relatively high interest rate, are replaced by "permanent loans" from insurance companies, pension funds, or other institutions able to place money at a lower rate and for longer periods. At that time, banks loaned at most about two-thirds of construction costs, forcing even well-established builders to seek preliminary financing outside formal channels.*

[...] CHAPTER EIGHT [...]

CHAPTER NINE - WASHINGTON TO THE RESCUE

LIKE HIS FATHER, FRED TRUMP was determined to better his station in life by the fastest route possible. By the time Fred Trump came of age, however, the physical frontier where his father met his biggest success was gone. So the son found another wealth-providing frontier: government. As he soon discovered, this frontier had many virtues, chief among them that, in the mid-1930s, it was not disappearing but growing. Greatly expanded by a host of New Deal programs, government offered rich opportunities to those, including Fred Trump, who proved particularly adept at figuring out how to use these programs to their own maximum advantage. This was not illegal or even particularly sneaky. Indeed, Fred Trump did exactly what the government hoped all the Fred Trumps in the land would do. And in so doing, he joined the ranks of entrepreneurs who constitute one of the oldest fraternities in the Republic: multimillionaires who owe their fortunes to subsidies from a grateful government.

Although he did not know it at the time, he set out on this new road shortly after nine o'clock on the morning of Tuesday, March 27, 1934, when the Brooklyn Federal Court approved his purchase of the Lehrenkrauss mortgage-servicing business. Although he would be managing a fraction of the mortgages once held by Lehrenkrauss, the fee—one-half of 1 percent of all monies collected on what remained—would allow him to leave the supermarket business.1 Even better, he would have an inside line on properties about to be foreclosed and available on the cheap at court auctions. With this one favorable nod, the court had provided him with what he needed to relaunch his real estate career. It was an enormous plum, for he would be reentering the field with access to a steady cash flow, permitting him to escape the perpetual mad scramble of the small-scale builder. At last he would not need to race the clock, frantically trying to sell each new house in order to pay off construction debts left from the last one.

That was how Fred Trump got his second start. What allowed him to keep going after the Lehrenkrauss purchase was that in short order he would receive a second and even larger plum. While he had been scheming to obtain control of the one salvageable piece of the Lehrenkrauss wreckage, New Deal economists in the nation's capital were setting about the task of resurrecting the Depression-racked home construction industry. In the process they created a set of circumstances—in effect, a new frontier—in which builders could make money. Almost as an aftereffect, housing would be built.

The one thing developers like Fred Trump couldn't do on their own was to stimulate consumer demand. Even Fred Trump's formidable energy could not produce home buyers in the middle of the Depression. As an individual entrepreneur, he did not have the power. But national policy makers did. The same

home-building industry collapse that had dealt a blow to Fred Trump had been a disaster to the country. To government officials trying to revive a moribund economy, helping the construction industry back on its feet was a high priority. They wanted to put the blueprints and bricks back in Fred Trump's hands as much as he did.

Accordingly, at the same time Fred Trump was maneuvering in federal court in Brooklyn, President Roosevelt's inner circle was trying to figure out how to jump-start the home-building business. After months of feverish discussion and sometimes bitter negotiation, they created the Federal Housing Administration (FHA), and within the next year the entire industry underwent a drastic change. What had been a relatively low-key, local affair became a bustling, large-scale enterprise. In the process, those who could adapt to the changed political and regulatory landscape had an enormous competitive advantage. One of the most successful among them would be Fred Trump. Over the next two decades he would use the FHA to provide homes, to enrich himself, and to help create a new quasi-suburban way of life in the outer boroughs.

***

By early 1934 there was no argument about the enormity of the nation's financial crisis. From 1929 to 1933 income had fallen by 36 percent, which meant that, accounting for fluctuations in the value of the dollar, per-capita income was almost as low as it had been in the depression year of 1908. One out of every four workers in the nation was unemployed.2

The whole U.S. economy seemed in near free fall, but real estate was especially badly hit. Almost one-third of the jobless—the largest single category—were in the building trades.3 New housing starts, which had hit an all-time high of 937,000 units in 1925, plunged to 93,000 in 1933.4 One out of ten home mortgages in the United States was in default, and many more were in serious trouble.5

Meanwhile banks, the source of the capital needed for mortgages and new construction, were failing at an unprecedented rate. Those that stayed open were continuing to hemorrhage from withdrawals of cash by insecure American depositors and withdrawals of gold by jittery foreigners.6 By March 1933, on the eve of Roosevelt's inauguration, the banking system was in such chaos that about half the states had declared bank "holidays," the popular euphemism for official permission to keep the doors shut. Three days later the new president declared an unprecedented national bank holiday. In fact, it was more like a bank spring vacation, as it lasted more than a week. This hiatus provided breathing space and time for Congress to crank out emergency banking legislation, but it did not cure the country's financial ills. Of the 17,800 commercial banks in the United States, more than 5,000 delayed reopening, and of these over 2,000 closed permanently.7

Everywhere the nation's bankers were trying desperately to keep their institutions afloat. But out in Utah one of their number went further. Scrambling to keep his own establishment open, Marriner Eccles unexpectedly began formulating questions about the nation's financial underpinnings that would shock his colleagues, intrigue the president, and have a profound effect on Fred Trump's future. From the outside he seemed an unlikely innovator; the thirteenth of twenty-two children born to a practicing polygamist, he was a devout Mormon, a high school dropout, and a conservative Republican. A successful man who managed a number of family businesses, Eccles had never doubted the conventional economic wisdom that enough budget cutbacks would cure even the worst economic ills.

Then, one day in the early 1930s, he faced a run on his own Ogden bank. On the day it was expected, he opened every window and coached tellers to look up every signature card, use small bills, and count slowly. When three o'clock approached and people were still in line, Eccles stood on top of a black-and-gold marble counter and announced that the bank would not close that evening as long as anyone desired service. The next day he reversed orders. The bank opened two hours early, and clerks ignored signature cards and made fast dispersals with big bills. No lines formed, and a business-as-usual atmosphere prevailed. "That was the end of that run," Eccles wrote later. "I thanked God for the nerves I inherited from my father and mother."8

Although his tightly scripted series of moves had saved his own bank, he began to question the traditional notion that continuous belt-tightening would eventually bring the economy around. Rather than helping, he said later, this policy seemed to be "throwing a double loop around the throat of an economy already gasping for breath." Departing ever further from his past assumptions, Eccles declared that government should not be considered in the same light as a business or a family. The latter needed to balance their books or they would go bankrupt, but the government had the unique power to issue money, levy taxes, and in general change the rules of the game.

In fact, Eccles asserted, the government's job wasn't to balance the budget, but rather to put people and money to work. From there it was only a short leap to the distinctly heretical notion that getting the economy moving again meant accepting, and even embracing, an unbalanced budget, at least for the short term. At the same time, Eccles remained firmly on the side of private enterprise and a limited role for government. He wanted to get the country moving again by strengthening the private sector and using its resources, not by having the government sweep in and pick up the tab.

In February 1933, as Fred Trump was arranging supermarket shelves in Queens, Eccles attended an economic conference sponsored by the Senate Finance Committee. One after another, leaders of industry, finance, and labor reiterated that the best medicine for the economy was no medicine other than occasional relief for creditors and investors. When the man Fortune would later describe as a prophet spoke up and suggested a deliberately unbalanced budget, his audience was startled. Then he went on to speak of relief not for creditors, but for debtors—that is, the unemployed, laborers, and farmers. By the time he got to minimum wage laws and higher income and inheritance taxes, his listeners were thoroughly alarmed.9

Unrepentant, Eccles headed to New York to meet an economics professor at Columbia University named Rexford Guy Tugwell. The circumstances did not bode well. Tugwell was late because he had been sitting in a dentist's chair. Obviously feeling guilty, he asked Eccles to share a lunch of sandwiches at a drugstore booth. Tugwell, his jaw throbbing, popped pain pills, listened as the renegade western banker outlined his unorthodox proposals, and then sent him on his way without comment. Unbeknownst to Eccles, the prominent English economist John Maynard Keynes had already advanced similar ideas, and Tugwell was receptive to them. But Eccles knew nothing of this until nine months later, when Tugwell, then serving as assistant secretary of agriculture, abruptly summoned him to Washington.

For three exhausting days Tugwell trotted Eccles around to meet other top Roosevelt administration officials, including Secretary of Agriculture Henry Wallace and Secretary of the Interior Harold Ickes. Because of what Eccles later called "my bizarre status as a reputed millionaire banker and industrialist who preached the gospel [of planned government deficits]," they were willing to listen to him.10 To Eccles's dismay, they were not willing to implement his ideas immediately. But they did want him on board. After he returned to Utah he received an invitation to become a special assistant to Treasury Secretary Henry Morgenthau Jr., and in early 1934 he reported for duty.

In the meantime, a working group known as the National Emergency Council met in the Oval Office with the president to dismantle the Civil Works Administration, a public works effort whose price tag was frightening the old-line budget balancers. When Roosevelt was asked for more money, he threw up his hands in horror and asked with dismay if there was any way to get the government out of the whole lending and relief business. "Sure," one of the men

gathered around the president's desk piped up. "A housing program." And thus began what was to become the Federal Housing Administration, provider of homes for American families and fortunes for American entrepreneurs.11

In March of 1934 a national housing task force got to work. Like everything else in Washington, the guest list was heavily WASP. "It was all Jimmy Stewart in those days," said one New Deal veteran afterward.12 The group included Secretary of Agriculture Wallace, Secretary of Labor Frances Perkins, railroad magnate and Democratic Party bigwig W. Averell Harriman, and Rexford Tugwell. Less well-known was the group's economist, Winfield Riefler, a statistician who had come to the Federal Reserve after working as a commercial banker in Baltimore.13 Colleagues had already singled out Riefler, a tall, skinny blond, as the ablest economist in the entire Fed. He proved it immediately by hiking over to the Treasury and asking Eccles about housing. For the rest of the day and well into the evening, they dissected the nation's financial paralysis. In the process, each found in the other someone willing to question economic shibboleths and to consider unconventional solutions.

When the two men finished talking, Eccles had signed up for the task force. But when he attended a meeting, he was dismayed to find what he called "social service worker" thinking, in which "housing" meant public housing, financed and owned by the government. When he pointed out that the group's members were long on enthusiasm but short on actual know-how for producing real homes for real people, he became head of yet another subcommittee to get the job done.

Together Eccles and Riefler planned what would become the Federal Housing Administration. Among other distinguishing features, the FHA would bear no resemblance to the federal government's only previous such effort, the thirty thousand housing units built for shipyard workers and their families during World War I and sold off at war's end.14 Convinced that government-built housing could not generate enough financial activity to make the economy hum again, Eccles wanted private banks to pony up funds for private construction. Riefler, who had experimented with the idea of mortgage insurance back in Baltimore, suggested the extraordinary notion of having the federal government insure private banks against losses when making loans to home buyers. As Roosevelt had requested, the government itself would thus be out of the lending business. It would not actually lend or give away a dime. Instead it would act as a guarantor of last resort, promising banks they would no longer have to assume all the risk. Bankers could then turn on the fiscal spigots, and construction could resume.

On June 27, 1934, the Seventy-third Congress of the United States passed the Eccles-Riefler plan in the form of the National Housing Act. Title I, the smallest and most quickly operational section, insured bank loans of up to $2,000 for home and office modernization. Within months these loans, which did not require collateral, put nearly $1 billion into the spending stream.15

Title II changed forever the way houses were built and financed in America. Fearing losses, banks had traditionally avoided giving mortgages for more than half of the appraised value of a home. Because most buyers did not have the cash for the other half of the purchase price or for the extortionate interest rates charged by those building and loan associations that provided bigger loans, they had to take out second and third mortgages. Worse, these loans were generally short-term, usually for no more than five years, and payments covered only the interest. When the loan was up, the borrower would hand over a whopping "balloon payment" on the principal and get the loan renewed. Even in the best of times many homeowners remained stuck in an endless cycle of overlapping mortgages, never able to finish paying off their homes.

Title II changed this practice completely. Banks could lend as much as 80 percent of the value of a home and lot, up to a maximum of $12,800, a generous sum at a time when half that amount would provide solid middle-class comfort. Moreover, there was a ban on balloon payments. The interest rate could not be higher than 5 percent, and the loan was both long-term and amortized—that is, payments applied to both interest and principal.16

If banks agreed to follow such radically different rules, the government would insure the loans. For this service, the buyer would pay an extra one-half of 1 percent of the unpaid balance of the loan. The premium or insurance fee would cover FHA administrative costs and also provide a pool to cover any defaults. The same terms would apply to rental housing, but until after World War II the FHA covered mainly single-family homes.

In less than three months Eccles and Riefler had come up with an entirely new approach to home building, figured out the administrative framework, made provisions for financing, and seen the final product through Congress. Now it was the official law of the land. But they were still short people who knew how to build houses.

***

In early May of 1934 a thirty-six-year-old architect named Miles Lanier Colean was hurtling toward the nation's capital in the backseat of an old jalopy. By virtue of the fact that he and several unemployed colleagues were willing to cover the cost of the gas, they were the official delegation from the Chicago chapter to the national convention of the American Institute of Architects. Colean, a lanky man with thick black hair and an architecture degree from Columbia University, was so broke that even his share of the expenses was a budget buster. The trip was a wild, desperate gamble that something would turn up.17

Upon arriving in D.C., the travelers crashed a party at a hot nightclub called the Troika. Because the host was Wisconsin's Robert La Follette, who had inherited his name, his liberalism, and his Senate seat from his late father, the guest list was full of young New Dealers. Colean managed to snag an invitation to the next housing task force meeting and soon was on staff. As a student Colean had looked at grand projects, not middle-class housing, and he had later worked on some of the most spectacular examples of overbuilding, including the Palmer House and the Stevens Hotel (later the Conrad Hilton) in Chicago. But unlike most of his colleagues, he had at least thought about large-scale housing development, which he had begun to explore as the building industry of the 1920s shuddered to a dead halt.18

By the fall of 1934 the FHA had perhaps a hundred employees, scattered in empty government offices around downtown Washington. Many were in an upper floor of the spanking new post office building, a neoclassical columned behemoth at Pennsylvania Avenue and 12th Street. Decorated with elaborate sculptural programs, dozens of murals, mahogany wall panels, and cut-glass chandeliers, it was part of a complex known as the Federal Triangle. Originally planned by the Hoover administration as a central location for government employees, it was now crammed with New Deal agencies.19

Surrounded by near imperial splendor, Colean and others on the FHA staff labored all day and half the night, six and sometimes seven days a week, to come up with design and financing guidelines for modest single-family homes all across America. A standard joke around the office was to ask whether there was a doctor in the house—a ridiculous remark because the core staff was composed largely of Ph.D.'s unable to find academic employment.

Once a week they trooped over to the University Club, a few blocks away, and over lunch they filled each other in on what they'd accomplished over the past seven days. To save time they ordered in advance, skipped dessert, and brought along a secretary who entered the men's club by a separate door and took notes on their discussions.20 On Sunday nights the planners gathered again at the home of Fred Babcock, an insurance underwriter and Republican from Chicago. Exhausted from work and homesick, the men who were going to put the building industry back on its feet relaxed over a home-cooked meal and

listened to Babcock, a portly fellow who was blind in one eye, play violin and piano trios with his children.21

Early Monday morning they started right back in again arguing and negotiating over how to go from half a dozen pages of legislation to concrete procedures that would attract loans and prevent cheating. The one thing they all agreed on was the need for rules that were, in the words of one participant, like a good farm fence—"pig tight and bull high."22

One major departure was to focus not only on the builder's ability to command a loan, but also on what was being built. For the first time, there was an emphasis on land planning rather than simply adopting a standard gridiron plan. There was also research on which designs had the best track record. They collected data showing that small, well-planned, well-built houses that adhered to simple standards, like making the bathroom accessible without having to pass through a bedroom, held value better than large, elaborate homes that became white elephants in a slump.23 Market studies on the number and cost of houses in different parts of the country were another innovation. Ernest Fisher, a bespectacled older economist from the University of Michigan, sent researchers to Charleston, West Virginia, to ring every doorbell—including those in the large red-light district—and ask questions.24

Fred Babcock pioneered another important change. Every day he came in, carefully removed his jacket, rolled up the sleeves of his white shirt, and worked on the first nationwide standards for real estate appraisal. In part, this meant figuring out how to assess the creditworthiness of the borrower. Determined to avoid the stranglehold of loans made for unrealistically short time periods, Babcock devised a system of level payments that stretched out over a number of years and covered both interest and principal. To figure out if a mortgage had an acceptable level of risk, a lender could check whether the prospective buyer made enough money to cover the monthly payment—now a routine procedure, but novel at the time. Using this approach, borrowers could feel secure that by paying the same amount each month for a set number of years, they would eventually own their homes, and lenders could feel assured that monthly payments would arrive and they would not have to resort to foreclosure.25

Babcock and Colean also worked on methods to assess the real estate itself. Colean made sure there was an architectural examiner in each local FHA office, hardly a problem in the depths of the Depression. "I became known as the relief agency for the architectural profession," Colean said later.26 Because many areas lacked building codes, the FHA put together its own minimal standards for key elements like indoor plumbing, fire protection, sewage disposal, lot size, and subdivision planning. In doing so, it was essentially providing the first nationwide structural standards.27

Colean and Babcock's chief concern was for the economic soundness of FHA-insured mortgages, not for those who would actually be buying the houses. Indeed, they and their colleagues regarded the FHA not as a do-good government agency, but as an independent, professional insurance program, run on sound businesslike principles. Real estate refugees who had fallen on hard times made up much of the staff, and they understood their clients to be other members of the same real estate fraternity—that is, builders, mortgage bankers, and insurance brokers. Hardly surprising, the culture that developed within this new agency was oriented toward business interests rather than toward consumers or social reform. Thus, for example, the FHA had firm guidelines on what was called "neighborhood homogeneity," based on the premium Babcock's risk appraisal system placed on communities whose families had similar economic, religious, ethnic, and racial backgrounds. In practice this meant that the FHA went along with the restrictive covenants against Jews, Armenians, and other minorities that were common in that era. Its underwriting manuals also strongly discouraged "inharmonious uses of housing," a code phrase for selling homes in white areas to blacks.28

Wary of the FHA's unconventional approach and unconvinced by the businesslike nature of the enterprise, the large insurance companies continued to hold back. It was an enormous problem, for they alone had the resources to lend on a nationwide basis. "The FHA was still a brand-new outfit, with people bumbling around trying to figure out what to do," recalled Philip Brownstein, an FHA staffer and later agency head. "Here you had this crazy Roosevelt determined to bankrupt the entire country—most people thought this program was just too risky."29

Then Stewart McDonald, a car manufacturer who had at one time been police commissioner of St. Louis, took charge. A big, fat man, he considered himself, probably correctly, to be tougher and richer than most of his critics. "This job wouldn't keep me in cigarettes, if I smoked cigarettes," he once told a hostile congressional committee.30 Appointed FHA administrator on September 5, 1935, he quickly dispatched junior underwriters to beat the bushes for prospective FHA customers. At community centers and schools, churches and civic groups, the staffers touted what the FHA had to offer. When they couldn't find a meeting to address, they called one themselves.31 Gradually smaller insurance companies jumped in and started making money. Soon major league outfits in New York City were wading in as well.32 By 1939, five years after Win Riefler went over to the Treasury and talked to Marriner Eccles, the agency that came from their efforts was insuring about one-quarter of all new homes in the country. In 1935, the FHA's first full year of operation, it insured only about twenty-three thousand home mortgages; in 1941, it was covering over two hundred thousand loans.33

In turn, mortgage banking changed from a strictly local form of investment to a nationwide industry. Mortgage bankers could handle FHA-insured loans at the local level, then sell the mortgages on the so-called secondary market to large national institutions like insurance companies and big northeastern banks. Because of FHA standards as to the quality of construction and the terms of financing, FHA-insured mortgages were now marketable commodities all over the country. For the first time, capital in large financial centers could flow out to local banks and home buyers in distant locations.34

One of the busiest locations for FHA-insured mortgages would be New York City, and one of the most active builders there would be Fred Trump. Working in Brooklyn and using FHA-insured mortgages, he produced two thousand single-family homes between 1935 and 1942. Well designed and well built, these dwellings became known as Trump homes. As the public grew to know the name as a symbol of quality, within real estate and financial circles it was becoming known for shrewd business practices and entrepreneurial skill.

CHAPTER TEN HOME BUILDING'S HENRY FORD

TUCKED DEEP INTO THE RECESSES of page thirty-six, The New York Times on August 12, 1936, carried a brief story, just three paragraphs long, that laconically described the most important event of Fred Trump's life.1 At eleven o'clock the day before, Thomas G. Grace, New York State Federal Housing Administration director, had officially inaugurated the Trump Holding Company's new development in a section of central Brooklyn known as East Flatbush. Standing before more than one hundred invited guests, the FHA director waved his arm at an immaculate one-story model house and declared the first forty-eight homes open. Then he presented Fred Trump and his new partner, Charles A. O'Malley, with a plaque commemorating FHA approval of their 450-home project.

In the audience that hot, muggy day was Fred Trump's wife, Mary Anne, a twenty-four-year-old with brown hair and bright blue eyes.2 Born Mary Anne Macleod and the youngest of ten children, she had emigrated six years earlier from Stornoway, an island in Scotland's Outer Hebrides known for herring, sheep, and Harris tweed. Scot Gaelic was her first language, and when she arrived in New York, on the day after her eighteenth birthday, she spoke English with a heavy burr. Unskilled and unemployed, she lived with her married sister in Astoria, Queens. One night she went with her sister to a party and met a blond man with a mustache who was half a dozen years her senior. His name was Fred Trump, and when he went home that night he told his mother he'd just met the woman he was going to marry.

Mary Anne was immediately attracted as well. On a visit to Scotland soon afterward, she told her parents she had met her future husband. They married in 1936 on the second Saturday in January, celebrated at the Carlyle Hotel, and went to Atlantic City for their honeymoon. Characteristically, Fred Trump was too busy to take more than the weekend off. On Monday he was back at work, and Mary Anne had become a housewife. Now it was eight months later, and she was four weeks pregnant with her first child. Smiling graciously despite the August heat, she greeted her husband's friends and colleagues.

Also present at the dedication was Elizabeth Christ Trump. Fifty-six years old, her blond hair turning gray, she was a well-dressed and imposing figure. Just before the bottom fell out of the building industry, she had returned to Germany to see her family and show off her children. Looking around at them today, she felt even more proud than before. By working hard, her older son had found his way back into real estate. **Her daughter's husband, Bill Walter, had become a successful banker, and they had produced two grandchildren, both boys.** Her younger son, John, had a doctorate in electrical engineering, an appointment as an assistant professor at MIT, and a wife named Elora Gordon Sauerbrun. A church organist in Queens, she, too, was from a German background.

Fred Trump was happy to have his entire family in attendance. But the real proof of his success was the men who were there because they did business with him. Charles O'Malley, who had replaced William Demm as Trump's partner, was sixty years old, exactly twice Trump's age, and the official real estate appraiser for New York City. O'Malley brought big-league credibility and status to the partnership, for he had appraised $2 billion worth of property, including the remains of the House of Lehrenkrauss.3 Bill Hyman, the real estate lawyer Trump had met during the Lehrenkrauss hearings and subsequently retained, was also there. Other guests included the district director and main underwriter for the FHA's Brooklyn office.

The biggest coup was the personal appearance of Tommy Grace. A lawyer from Bay Ridge, near Coney Island, Grace, thirty-eight years old, had received an appointment as the first state FHA director the previous year. A decorated war veteran, law professor, and, despite his diminutive stature, former football coach, he had rung doorbells, tallied support, and pulled out the vote on election day. As recognition for his unstinting effort, the local Democratic machine had pushed for his ascension to the FHA.4

As with the awarding of the Lehrenkrauss mortgage-servicing business, politics and, especially, the Madison Club played a major role in the history of the new development in East Flatbush. "Freddy," as Trump was called by Madison pals, never missed a political event, willingly shelled out for every dinner and benefit, and occasionally paid a personal visit to the three-story brownstone that served as club headquarters. Downstairs was a big meeting room full of folding chairs and a lounge with old leather-covered seats; upstairs, in a warren of tiny offices, club officials worked the phones and the mimeograph machines. Out on the surrounding streets, ambitious young club members like Abraham Beame, a high school accounting teacher and later mayor of New York, spent their evenings dropping in on registered voters to see what could be done to keep them in the Democratic fold.5

Through these political contacts, Trump had explored the status of a large vacant tract on the southern edge of Madison Club territory. A stretch of old swampland, it was in East Flatbush and had been the dumping ground for dirt excavated during the construction of the Nostrand Avenue subway. Each year the Ringling Brothers circus camped there for a few weeks after its run at Madison Square Garden. The rest of the time local residents used the area for truck gardens and ball fields—soccer in the fall and baseball every spring.

Working out of one of the unsold houses he had built in Jamaica Estates, a sizable mock Tudor stucco affair on Devonshire Road, Fred Trump had learned all he could about two things: the new FHA mortgage insurance program and the Flatbush site. Over the months he tracked down individual properties that were either in foreclosure or about to be, including some from the Lehrenkrauss connection. In the past, he had built on a relatively small number of lots at any one time, sometimes only a single parcel. But with the FHA behind him, he was able to get loans based on the soundness of his plans rather than the size of his bank account. As a result, for the first time he could put together whole packages of adjacent lots.

Finding out exactly who owned what was a complicated business, and more than once Bill Hyman had to trace titles back to the original Dutch land grants. It was also a delicate business, for if owners found out that they had the last few parcels within a larger area, they could hold out for higher prices. But creating such packages was a business Hyman was good at. Poring diligently over dusty records and then standing unobtrusively at the back of city auctions, he was able to buy up tax liens, many on old farmland on which owners had stopped paying taxes long ago. To avoid detection, he used pseudonyms, stand-ins at auctions, even dummy subsidiary corporations.6 He would do whatever it took. "Whenever you went to a closing with your dad," Fred Trump later told Hyman's son David, "the deal always closed."7

Once Trump had secured the East Flatbush tract, he hired an architect and put him to work with a set of the FHA guidelines produced by Miles Colean. They spelled out official requirements, such as the inside bathroom reachable without going through a bedroom; elsewhere Trump learned about the unofficial requirements, like a brick exterior. Plans in hand, he then went to Tommy Grace. For the initial development of 450 houses, Grace approved $750,000 in mortgage insurance, making Fred Trump one of the first New York builders to get such an FHA commitment. He could then proceed to a commercial bank such as Dime Savings, with which he had established a close relationship, and get the money he needed to go into high gear.8

By mid-1936 Fred Trump had four hundred workers digging out the foundations for houses that would be priced from $3,000 up to $6,250. Unlike many other builders, he did not hire someone else to oversee his jobs. Instead he acted as his own general contractor, reporting to the job site every morning at seven-thirty and watching his crews frame the houses one by one. Within crews, which were all white and a hodgepodge of nationalities, specific craft was usually a matter of ethnic origin. Thus, for example, Swedes were woodworkers and Italians were plasterers. But Fred Trump, who had constructed whole houses by himself, knew how to do every job. Whenever he spotted something being done badly, he stepped in and showed how to do it better and faster.9

To get maximum value out of the land, he built attached row houses with common walls. He avoided corner lots because they were expensive; fortunately East Flatbush blocks were so long that there was room for dozens of row homes to stack up in the midblock sections. Every weekend eager buyers crowded his sales office. Within months he had expanded to similar projects in other Flatbush neighborhoods, again using FHA mortgage commitments to obtain construction loans from banks. To speed up the work, he installed floodlights and hired a second shift of workers to put up houses, lay sidewalks, and pave streets.10

By the time he opened his first section of houses, in August 1936, he was looking into doing more projects nearby. Soon long rows of what became known as "Trump homes" dotted central Brooklyn. Built of dark red brick, they had a distinctive, recognizable look: a beach-towel-size swatch of front lawn, three front steps, and a tiny porch. At the same time, each house was slightly different from those of its neighbors. Faux gables and peaks ornamented the roofline, but not in a uniform fashion. Rusticated stone surrounded a window here and a door there, and minichimneys sat on top of some houses but not others. Every so often one or two homes sat a few feet closer to the street, breaking up the solid line of house fronts. The brick balustrades in front of the porches had a variety of patterns, including stylized key slots or crosses that created long stretches of large capital T's, prefiguring his son's constant use of both initial and name.

Inside the houses there was a similar attention to detail. The front door did not open directly into the living room, but into a minuscule foyer with a coat closet that had a mirror inside the door. Between the small living room and the smaller dining room was a rounded archway rather than the standard squared-off opening. Instead of using linoleum, Trump laid down hardwood parquet floors, and around the kitchen sink was ornamental tilework. The plumbing fixtures used high-quality copper pipes, and in some houses the stairs came carpeted.11

Sitting beneath each house was the emblem of the twentieth century, a garage. Entered by a steep ramp from the street, it had heat in the winter and its door was wonderfully visible year-round. The garage was a source of pride for Fred Trump's customers, even though most could not afford a car and did not know how to drive. Indeed, one of the big draws of Fred Trump's first development was its proximity to the Nostrand Avenue subway and the Utica Avenue bus. Nevertheless, said Marian Kelley, who in 1936 bought the second home Fred Trump built in East Flatbush, the garages meant that these houses "were the big thing—the modern home."12

The garage was hardly the only up-to-date touch. Instead of old-fashioned dormer windows, the houses had casements with small glass panes. In the bathroom the tub was framed with chrome, and there was a hand-painted landscape on the wall instead of the usual wallpaper. Some houses had stall showers, a novelty at the time; others had living rooms with shallow false fireplaces and electric logs that lit up when plugged into an outlet. The basements were not rough storage areas, but finished "recreation rooms" that could be rented out to help pay off the mortgage. Many had a bar with a mirror and a little foot rail in front. "Back then," said homeowner Kelley, "that was real class."

This classiness, which came from Fred Trump's sense of craft, was his new competitive edge. The FHA had launched several builders in Brooklyn, and the most direct competition came from two brothers named Match. "We'd have a front porch, and the Matches would put in a front porch," Fred Trump later told one interviewer. "We'd have a back porch, they'd have a back porch. Toilet upstairs, toilet downstairs. In the beginning, our houses sold for $2,990, $300 down, but they were always quality. . . . Do you know what I mean?"13

The people who lived in Trump homes were the middle of the middle class, or "middle-middle" as one former resident described her neighbors. Mostly young married couples with kids, they included teachers, lawyers, doctors, dentists, middle managers, small-business owners, accountants, a funeral director, and lots of housewives. The center of social life was the porches. All day long kids climbed over, under, and across them. At dusk their parents and, in some cases, grandparents sat there and talked as the kids threw and kicked balls against stoops and up and down the sidewalk and street. "Moving there was a nice step up," said novelist Lynne Sharon Schwartz. "My parents would say proudly, 'We live in a Trump home.' "14

As he had done earlier in Queens, Fred Trump periodically returned to the neighborhoods he had built, checking on how the houses were holding up. Dressed in a coat and tie, he would drive around the streets in a late-model car—at one time a red convertible, later a black Cadillac—and talk with his customers. When he visited Marian Kelley, he would chat with her husband, a store manager for A&P, about the supermarket business. Two years after they purchased the house, he helped them switch to gas heat, which was cleaner than the coal they had been using. "We were young, and we knew nothing about purchasing a house," she said. "He was so pleasant and reliable—it meant a lot to us."15

***

Within a year after that August day when Fred Trump opened his first Flatbush home, the country was once again in a recession.16 The rosy picture at the end of 1936—270,000 new homes that year, and predictions of another 400,000 to 450,000 in the year to come—turned dark only a few months into 1937. By April it looked as though the country would be lucky to stay at 1936 levels. A worried Marriner Eccles lobbied the president to do something, and they both began looking to the FHA to get the economy moving again. Coming back from a White House meeting, FHA administrator Stewart McDonald relayed to his staff their marching orders: "Tell the old girl to paint her face, pull up her skirts, and get out on the stage."

Early in 1938 Congress passed liberalized FHA regulations. Borrowers could have up to twenty-five years to pay back mortgage loans, which could cover up to 90 percent of the purchase price for homes costing $6,000 or less. Such changes had a salutary effect, but they worried agency staffers. The FHA had barely gotten started, and this was an enormous new burden. The FHA's original purpose was to stimulate construction by helping bank activity reach normal levels. Now the agency was supposed to rev up the entire economy.17

Fred Trump had no such qualms. Despite his optimistic comments to the press, he had taken a hit during the economic downturn. Now, though, with changed FHA regulations, he was back in business. In March 1938 he joined other builders to form the Brooklyn Home Builders Association, a trade group intended to promote FHA-insured mortgages. Immediately the FHA committed $1 million in mortgage loans for another cluster of Trump homes in Flatbush.18

That July Fred Trump made his five hundredth sale in Brooklyn, and the Eagle hailed him as "the Henry Ford of the home-building industry."19 It was an apt description. Although he was in an industry long dominated by small operators working off the back of an envelope and still worked that way himself, he belonged to the new breed of producers who were putting together their own version of mass production. He built in multiple units, which allowed economies of scale such as ordering bricks by the carload and equipment in large enough shipments to earn discounts. Similarly, he bought lumber in bulk quantities and cut it to size in his own lumberyard, paid in cash to lower costs, and staggered construction to keep crews busy year-round.

By 1938, Fred Trump reported proudly, these methods had lowered his costs from twenty-nine to twenty-five cents a cubic foot.20 By keeping costs down and taking advantage of the new FHA regulations, he was able to produce good homes at such low prices that people were literally jamming the streets to buy his projects—or so he bragged to the New York Evening Post. Indeed, the builder claimed, there was such a commotion one day at his sales office that he had to call in the police to handle the mobs of eager buyers.21

In 1941 he was working on three hundred homes at once and took in $1 million in sales.22 Having run out of empty land in East Flatbush, he had moved his operation to Brighton Beach, on the other side of Brooklyn and one block from the Atlantic Ocean. There he unleashed tractors, derricks, steam shovels, and cement mixers on land that had once been a terminal on the Long Island Railroad.23 Working day and night, hundreds of bricklayers, carpenters, painters, and plumbers raced to meet tight deadlines. To keep up morale and productivity, he installed bathing lockers so workers could go swimming on their breaks,24 and to keep sales up, he promoted his homes constantly. Once he put on a public wedding ceremony for four couples and offered prizes for babies born in Trump homes; other ploys included a push to get "Own a Home" on license plates, a beachfront barge with Trump ads, and, at Coney Island, the release of balloons with coupons for $50 off on one of his $4,990 bungalows.25

Stories on every one of these initiatives appeared in the media, for Fred Trump had learned how convenient newspapers found short news releases for filling news holes. He generously provided item after item. Brief summaries of his sales reports, his market predictions, his "survey" of what had attracted buyers to his homes, and his opinions about everything from family values to national national defense went to local media, which often reprinted the pronouncements verbatim. In this way New York newspaper readers learned, among other things, that Fred Trump considered it a patriotic act to build one-family homes—but not apartments—for Americans26 and that in his opinion renters were mere drifters capable only of brief friendships. To be well-balanced, he declared, children needed to grow up in homes owned by their parents; luckily, his developments were especially child-friendly. Elsewhere he

balanced, he declared, children needed to grow up in homes owned by their parents; luckily, his developments were especially child-friendly. Elsewhere he explained that in inflationary times, instead of postponing buying a home, people should snap one up right away as a hedge against further inflation.27 He did not limit his remarks to industry concerns; when Roosevelt overturned historical precedent and ran for a third presidential term, Fred Trump sent a letter of endorsement to home-builder organizations across the country.28

Within Brooklyn and Queens, Fred Trump had become a public figure. In June 1937, when a stooped and shabby Julius Lehrenkrauss emerged from Sing-Sing prison with $20 to his name, Fred Trump was a highly prosperous businessman. Only in his mid-thirties, he had already built more than two thousand houses and expected to erect thousands more. By 1943, when Lehrenkrauss died alone and impoverished, Trump had become a millionaire.29 Now a father, he would pass on this wealth and property to his children. He would also pass on to them something else equally valuable: what he had learned about the usefulness of the media.

***

Soon the gathering conflict in Europe would sweep up nearly everyone in the country, including Fred Trump. In January 1941, six months after the fall of France, the president established the Office of Production Management (OPM). Its mandate was to mobilize American industry for defense. Across the nation it impounded construction materials, and most private housing came to a dead halt. Fortunately for Fred Trump, the presence of the Brooklyn Navy Yard allowed the borough to qualify as a "defense housing area." In order to provide homes for defense workers, Brooklyn builders could still obtain supplies and FHA mortgage insurance.30 In October 1941 the first OPM priority in New York for a major building operation went to Fred Trump for a new project in a section of Brooklyn called Bensonhurst. He had paid cash for a fifty-five-acre tract on which he proposed to build seven hundred houses, the biggest project so far for him and for the New York FHA office.31

Bensonhurst would also be his first project to fall behind schedule. After the bombing of Pearl Harbor in December 1941 and the American declaration of war, the OPM hurriedly withdrew Brooklyn's priority, and local construction sputtered out. But Fred Trump was hardly in trouble. The government had asked him and other developers from the New York area to build defense housing at Norfolk, Virginia, the center of naval operations for the entire East Coast. To sweeten the invitation, Congress added a new provision to the National Housing Act, used to create the FHA back in 1934. Known as Section 608, it provided generous mortgage insurance for multifamily rental housing—apartment houses—for war workers, particularly when located near war plants.32 Fred Trump patriotically decided that the nation needed more apartment buildings.

His turnabout on the desirability of apartments rapidly followed his discovery that building them would let him be an owner, not just a builder. After he finished a development, he would not simply visit every now and then. He would collect rent every month, and he would have equity. Duty had called, and Fred Trump had answered with alacrity. Even before the enactment of Section 608, he was supervising five hundred construction workers at a new apartment complex. Called Oakdale Homes, it was located in what had been an old barroom and red-light district outside the Norfolk Naval Base and Naval Air Station in coastal Virginia.33

Norfolk, an ice-free, deepwater port at the south end of Chesapeake Bay, had long been an important center for shipping and shipbuilding. Over the years the city had expanded at a slow and stately pace, growing to about 140,000 inhabitants at the time of the 1940 U.S. census. But when Fred Trump arrived only two years later, the city had nearly doubled in size and was a boomtown bursting at the seams. During the frantic last-minute American defense buildup, the Pentagon had sent 30,000 men and women in uniform to Norfolk-area bases, and the city continued to swell with the arrival of more soldiers, sailors, shipyard workers, and their families. "There were so many servicepeople here, I hardly knew anybody who had a spare room who didn't take people in," recalled Carol Melton, a Norfolk grande dame who was a young housewife at the time. "You never drove anywhere without picking up sailors or servicepeople. I wore out the upholstery in my new car the first year."34

Fred Trump was stunned. "Norfolk is like a beehive," he told the New York Herald Tribune. There were long lines at stores, and it was standing room only at the movies every night. When it was his turn at a phone booth, getting a call through to New York could take hours. The housing shortage was so drastic that landlords resorted to "hot beds," rooms rented to one tenant during the day and another at night. Local builders had responded with a sprinkling of new homes, but they couldn't possibly meet the overwhelming need on their own. Nor did they want to. They had been stuck with empty housing after a big buildup during World War I, and they were wary of ending up in the same predicament once again.35

For Fred Trump and other outside builders coming to Norfolk, the overcrowding meant he was in the right place at the right time. "Rents are still soaring here," he reported elatedly to the Herald Tribune. Newcomers were so desperate for housing, they weren't waiting to see finished apartments. They lined up for the privilege of renting and signed leases based on blueprints. The previous weekend, Trump noted, forty naval officers showed up at his job site looking for places to live.36 Nearly half a century earlier Frederick Trump had found Seattle and the Yukon to be where the action was; now his son Fred was discovering the same thing in Norfolk.

Fred Trump's partner in Norfolk was James Rosati, a former plastering contractor in Queens. After the Depression Rosati had switched to road construction and had supervised the relocation of dozens of homes that were in the path of the Van Wyck Expressway and Idlewild Airport (later renamed for John F. Kennedy). Watching as war fever mounted across the United States, Rosati headed for Norfolk just before Pearl Harbor and snapped up property near the naval base. When Fred Trump, who had met Rosati in New York, arrived soon afterward, the two builders from Queens teamed up to develop Rosati's land.

Although they were both New York born and bred and only three years apart in age, they were an unlikely pair. The older of the two, Rosati was short and chubby with dark hair, dark eyes, and a big nose. A gregarious man, he was so outgoing that almost as soon as he arrived anywhere he knew everybody's name. Trump, his blond hair turned light brown, was reserved, a ramrod-straight figure with little to say. When he did speak, though, people listened, for his voice was loud and commanding.37 "He was already wealthy, but he wasn't flashy," said Rosati's son, James Jr., years later. "He never tried to impress anybody with his wealth. He didn't seem to care if anybody had ever heard of him."

Each man brought something important to the table. James Rosati had a talent for locating land in a new place, and Fred Trump had a track record of having successfully financed large developments through the FHA. Both were experienced at dealing with large projects and deadlines, something Norfolk builders had never before encountered. Both also knew the value of lining up local politicians, and they quickly made their way to the offices of key figures in Norfolk city government. "Nobody down there had ever seen the level of production and amount of work that went into the way things were done in New York," said James Jr. "It really took outside people coming in to get things moving the way they had to move."

Attorney Bill Hyman came south as well, and he and Fred Trump rented houses near the ocean at the resort community of Virginia Beach. Hyman brought his family, including two young sons who went to school at Virginia Beach, while Trump tried commuting back and forth to New York by train, plane, and, occasionally, his big black Cadillac.38 But driving nearly five hundred miles on preinterstate, two-lane roads took much too long, and getting priority for train and plane travel was too difficult. Eventually Mary Anne and the three children joined him.39 They were a handful: Maryanne, named after her mother,

was five years old and ready for kindergarten, but Fred Jr. was only three, and Elizabeth, named after her paternal grandmother and born shortly after her father had begun building in Norfolk, was an infant.

Almost every day the children of the neighborhood played on the wide, white beach. But the most exciting activity was to watch as the navy practiced amphibious landings and sailors manned the machine-gun emplacements installed at the end of residential streets. “Thousands of sailors would be running up and down the beach,” David Hyman recalled years later. “Norfolk was a sea of white hats, wherever you went. My father would come home from work and his little Chevy coupe would be like a circus car, filled with sailors on their way to Virginia Beach and the amusement park.”40

As the children searched the skies for Messerschmitt planes, Fred Trump was silent about his own German background. Although he had spoken German when he had visited Kallstadt just before the Depression, in America only his parents’ generation spoke the language in public. He began to deny that he knew German and did not teach it to his children. Eventually he started telling people that he was of Swedish ancestry.41 Mindful of the growing prominence of Jews in the real estate industry and local politics, he became so active in Jewish philanthropies that people often assumed he belonged to that faith.42

While Fred Trump was building housing for American military families, his brother was also contributing to the war effort. John Trump, who led the MIT High Voltage Research Laboratory, had already made a name for himself through his work with Robert J. Van de Graaff on the first million-volt X-ray generator. Used for radiation therapy, this invention would prolong the lives of cancer patients around the world. During the war John Trump worked on microwave radiation and served as director of the British branch of the legendary MIT Radiation Lab. There he played a key role in the development of high-resolution radar, the same technology that would replace the citizen plane spotting so eagerly provided by the young Hymans and Trumps.43

***

Oakdale Homes, Fred Trump and James Rosati’s first project, was half a mile from the Norfolk navy base and consisted of 216 garden apartments. Seemingly overnight, block after block of trim two-story brick buildings with two complete three-room apartments on each floor began to appear amid vast muddy expanses that would someday be tidy swaths of green. It was Fred Trump’s biggest development yet, and one of the largest in eastern Virginia. It was also his baptism in multifamily rental housing.

Working with his partner, several secretaries, and a handful of superintendents in a small office on the outskirts of Norfolk, Fred Trump was in his element. “He knew more about construction even back then than most people,” James Rosati Jr. recalled later. “My father was an expert. He knew so much himself that most people came to him for advice, but he looked up to Fred Trump. Fred was one of the only people my father would listen to.” Years afterward Rosati Jr., still remembered his awe when he saw Fred Trump add up long columns of figures in his head.44 Trump also knew more about how to get what he needed than most people. When sudden shortages occurred, as they did frequently in everything from toilets to steel girders, he used his clout back home to get items like steel stairwells, fabricated in steelworking facilities in New York, rerouted to Norfolk.

Rosati was hardly the only one who found Fred Trump’s facility with numbers and details awesome. “He was like a computer,” said W. Taylor Johnson Jr., whose father handled Trump’s insurance in Norfolk. “He ran everyone else ragged. How he could keep all these facts and figures in his head was just unreal. Different locations, different trades, dealing with union people—he could just keep changing gears and still keep the conversation going. I almost never saw him refer to notes.”45 Co-owner as well as builder, Fred Trump monitored his buildings for waste day and night, turning out lights and getting up on a stepladder to remove any bulbs he deemed unnecessary.46

Norfolk would provide many New York builders with their first experience working on low-cost, high-volume housing. One Long Island builder, Bill Levitt, who had done only custom homes, found this new focus an intriguing novelty. As Fred Trump was building Oakdale Homes, Levitt was finishing off Oakdale Farms, a nearby development of 750 two- and three-bedroom houses. Little more than a roof and four walls, these bungalows were his first with carports, a money-saving garage substitute that would become a signature on future Levitt homes.47 “Our marching orders were to come up with the cheapest livable housing that could be done,” Levitt said many years later. “It gave us a whole new slant on life.” After the war, this experience would produce Levittown, an enormous Long Island suburban development that would become an important symbol of the postwar era.48

Fred Trump had already built enough low-cost, high-volume housing to be dubbed “Brooklyn’s outstanding builder” by the Brooklyn Eagle. But now he had a large, cheap labor force, little competition, and a drastically expanded market, and he was building even bigger, even faster, and even more inexpensively.49 Talbot Park was his second Norfolk project. Although it had only 496 units, the cost was $4 million, a new high,50 and the buildings, which housed from eight to twenty families, were the largest he had ever constructed.51 In a newspaper interview he heaped praise on the FHA’s liberal new provisions for mortgage insurance, which included advances during construction and no limit on rates of return for builders. “Red tape is cut to a minimum,” he said excitedly, “and costly delays are eliminated.”52

By 1944 Fred Trump had built 1,360 units, nearly 10 percent of all the wartime housing created in Norfolk.53 As long as there was a housing shortage, he declared, he would put up at least 2,000 units a year.54 Or maybe more. His goal, he told the Eagle, was “to achieve the same position in the field of building homes for war workers that Henry Kaiser now occupies in shipbuilding.”55 And Fred Trump was doing everything he could to accomplish it.

BROOKLYN DAILY EAGLE, NEW YORK, SUNDAY, MARCH 15, 1931.

QUEENSBORO'S *Smartest* ADDRESS

JAMAICA ESTATES

Homes from $17,500

Stroll around this parklike section. You will wonder that this community, so like the aristocratic estates of Old England, is within the city limits of New York, and but twenty minutes from Broadway. ■ To live at *Jamaica Estates* is to add immeasurably to your enjoyment of life. Here you will find delightful surroundings of natural beauty, matched only by the exquisite architecture of these dwellings, with their many modern appointments providing an atmosphere of rare good taste. ■ Authentic designs in Early American, English Manor, and Georgian Colonial, with exteriors in stone, brick or stucco. No detail has been spared that these homes might suit the individuality of the high type residents in this community. ■ The living room is equipped with bookcases and a picturesque log-burning fireplace. ■ Each dwelling has three or four bedrooms with two or three bathrooms tiled in color harmonies to suit your own specifications. Automatic refrigeration, of course. Every home has a porch, some open and some attractively enclosed. Following the architectural design of each dwelling is a spacious two-car garage. ■ The beautiful landscaped plots range in size . . . none smaller than 4800 square feet.

MORE THAN HALF OF TRUMP HOMES IN QUEENS SOLD

Four weeks after their introduction to the public, the one-family dwellings built by the F. C. Trump Construction Corporation at Hillside Ave. and 206th St., Queens, are more than 60 per cent. sold, the company reports. Fred Trump regards this record as a favorable sign of increased activity in the small home market.

The location of his development, Trump believes, has much to do with its popularity. The homes are opposite the new Hillside Park, on a wide concrete boulevard. Rapid transit at a 5-cent fare will be available with the completion of the Hillside Ave. branch of the city's 8th Ave. subway system.

Yachtsmen at Miami Enjoy Fishing on Florida Keys

Special to The Eagle

Miami, Fla., Feb. 6—Members of Miami's Winter colony are again indulging their annual mid-season urge for yachting in the placid waters of the South Florida keys and daily some of the most palatial of the scores of yachts assembled in sheltered Biscayne Bay from points on the turbulent Atlantic seaboard as far north as Boston, are leaving here with owners and friends aboard for outings in the tiny coves and hidden channels among the keys where good fishing and good times abide.

Mr. and Mrs. John Weismantel of Brooklyn were among those occupying boxes for the horse racing at Hialeah Park on Friday. Among those visiting at their box was Gene Finnegan of Jamaica.

bassador Bath Club, a supper at the Colony Club Gala on Saturday night, another at the Florida Embassy Club in honor of her guest, Mrs. William Wallace, and a supper dance in honor of Arthur Yates. Mrs. Wallace, who is Mrs. Moran's sister, gave a fish dinner at Maginnis Fish Park at Stuart on Thursday evening, asking about 20 of the younger set to attend.

Mr. and Mrs. Charles W. Copp of Flushing, who are at their estate on the South Ocean Boulevard, are accompanied by their son, Carleton Copp, and later anticipate visits from others of their family. Their daughter, Mrs. J. Lamar Webb, is a permanent resident of Palm Beach.

Earlier in the week Miss Noma Harmon and Miss Anne C. Colleton—both of Hollis, L. I., were guests in the box of E. R. Bradley of Manhattan.

E. M. Bancker of Millbrook arrived on Thursday at Hotel Everglades for a sojourn of several weeks. Others registered there are Mr. and Mrs. Walter A. Fribourg, Mrs. Oscar Fribourg, Mrs. Ella Grossman and Mr. and Mrs. Andrew Viola, all of Brooklyn; Arthur Kelbe, Bayside; Fred O. Trump, Jamaica.

Late arrivals at Hotel Alcazar include Mr. and Mrs. Harry Adler and Philip Gerber, all of Brooklyn and Mr. and Mrs. A. F. Schneider of Great Neck.

Miss J. A. Ampel of Far Rockaway is among those registered at Hotel McAllister.

Mr. and Mrs. Frank Dondero of Babylon are late arrivals for the remainder of the season at Hotel Graylyn.

Franklin D. Jones of Flushing is among those returned to the Graylyn.

Others arrived for the remainder of the season at the Graylyn are Charles H. Nollman of Brooklyn and Mr. and Mrs. Joseph Peterman of Richmond Hill.

Miss Kate Rubins of Brooklyn is a late arrival at the Dallas Park Hotel.

Mrs. John C. McCarthy and son of Belle Harbor are at the Dallas Park for the remainder of the season.

Miami Golfdom

BY THE SPORTS GANG

A real, old-fashioned "blood match" Wednesday at Miami Springs found a couple of Dows against a couple of Combses, with the Combses winning, 1 up. Jimmy Combs carded a 69, brother Marty a 71, Willie Dow, 72, and brother Colin, 73. The Combses are from Toledo and the younger Dow is from Cleveland.

By Harke and Jules Huot gained a 2-and-1 victory over Ralph Kingsrud and Ed Landeen at Miami Springs. Huot, the Canadian professional, paced the foursome with a 70. More than 175 players registered at the Miami Springs course Wednesday.

Herman Barron and Willie Macfarlane, the former National Open champion, teamed out at the Miami Country club to lick Denny Shute and Roland Hancock, 2 up. Bill Pairman and Brooks Glenn also had a hot match against John Carlisle and W. L. Wooten. Miss Dorothy French, New York, played the Country club course. She will compete in women's tournaments here.

Badges for the International Fourball matches went on sale yesterday at the Miami Country club. The event is scheduled for February 19-23 and tickets for the four days are being sold 50.

The Miami Beach Country club course is becoming more popular every day. Mrs. Arthur Childers, chief statistician, announces that a grand total of 241 golfers played the course Wednesday. Among the newcomers were E. A. Harper, Detroit; Fred Trump, New York; James McLeod, J. Wilson and A. B. Armstrong in a Buffalo threesome; H. Kaufman, Binghamton, N. Y.; H. Turrell, West Orange, N. J.; Mr. and Mrs. C. H. Birdsell, Brownsville, N. Y.; Mrs. H. Rogers and Mrs. A. Serwer, Larchmont, N. Y.

Among the new out-of-town registrations at the West Flagler golf course Wednesday were C. W. Beringer, Indianapolis; Fred Eherenkranz, South Orange, N. J.; C. J. Grace, Tornah, Wis.; A. H. Monroe, Atlanta, Ga.; Mr. and Mrs. F. D. Wood, Louisville, Ky.; L. O. Gastineau, Charleston, W. Va.; A. N. Wigglesworth, Wilmette, Ill.; Mr. and Mrs. A. L. Rice, Chicago, Ill.

The play at the Riviera course has improved considerably since the installation of the 8-inch cups. About 100 players toured the layout Wednesday, the first day of the new receptacle, and 123 played yesterday.

Among the new registrations Wednesday at the Riviera course included E. C. Duffy, Darban, South Africa, playing with J. Lenkater, Detroit; Mr. and Mrs. W. C. Starks, Princeton, Ky., playing with Mr. and Mrs. L. G. Appleby, Coral Gables; H. Puddecombe, W. Puddecombe, A. Maboom, New Haven, Conn.; Mr. and Mrs. C. F. Cary, Cedar Falls, Iowa; P. R. Ryder, Olney Redmond, Schenectady, N. Y.; E. F. Holam, Rockford, Ill., and P. A. Ryn, Chicago.

[illegible], Ill., and P. A. Ryn, Chicago.

The Miami Beach Country club course had its best day of the season yesterday, 280 golfers touring the layout. It was a gain of 104 over the same day last year, when 176 registered. Among those playing the course for the first time this year were E. J. Rieckelman, Cincinnati; A. Ledy, New York; M. Kelik and Judge S. Frank, Brooklyn; I. Bordman and P. R. Jordan, Kansas City; Mr. and Mrs. A. Rosen, New Haven, Conn.; and I. R. Heller, Newark, N. J.

Frank Norman, well-known amateur, who formerly lived here but now makes Providence, R. I., his home, tried out Hawley Russell's eight-inch cups at the Riviera yesterday and shot the lowest score to date—31-33—64. Norman, who usually shoots around 75, had nine birdies for the round, and sank chip shots from off three greens. His statement anent the larger receptacles:

"While it gave me a new thrill to make so many birdies, I get more enjoyment out of shooting a 75 using the regulation cups than I did today in turning in a 64 with the eight-inch cans."

Norman also expressed the opinion that the large cups give a golfer a lot more confidence on the green, and that anybody who three-putts with an eight-inch cup staring him in the face is hopeless.

After receiving statements galore, Russell has arrived at the opinion that the average dub favors the eight-inch cups, and the better the golfer the less he likes 'em. He also believes that a compromise cup might meet the approval of all.

MORTGAGE-SERVICE BUSINESS AWARDED

Lehrenkrauss Branch Goes— to 2 Queens Operators

The mortgage-servicing business of J. Lehrenkrauss and Sons, subsidiary of the bankrupt Lehrenkrauss Corporation, bankers, brokers and shipping agents, was awarded today to William A. Demm, of Woodhaven, and Ferd C. Trump, of Jamaica, realty operators, whose bid for the business, made jointly, was higher than those of 13 others.

They bid $2,100 for the first million dollars worth of mortgages and $3,000 for each million dollars worth thereafter.

The award was made by Theodore Stitt, referee in bankruptcy, at a final hearing on this phase of the matter, attended by more than 200 creditors of the bankrupt firm.

The successful bidders will serve the mortgage holders, receiving fees for their services to such holders.

SAUERBRUN—TRUMP

Mr. and Mrs. Arthur Sauerbrun of 9222 177th St., Jamaica, announced the engagement of their daughter, Miss Elora Gordon Sauerbrun, to Dr. John George Trump, son of Mrs. Frederick Trump of 175-24 Devonshire Road, Jamaica, at a tea at their home Wednesday. Miss Ann Hopkins and Mrs. Ogden Avery Keep poured tea.

Miss Sauerbrun is a graduate of Jamaica High School and received the degree of Bachelor of Music Education from the Institute of Musical Art of the Juilliard School of Music in 1933. She is a past president of the Crescendo Club of Jamaica and is active in the Senior Crescendo Club and the Fortnightly Club of Hollis. She is well known in musical circles as a pianist and accompanist.

Dr. Trump received the degree of electrical engineer from Polytechnic Institute in 1929; Master of Arts degree from Columbia University in 1931 and the degree of Doctor of Science from Massachusetts Institute of Technology in 1933. He is a member of Alpha Chi Rho and the national honorary fraternities Tau Beta Pi and Sigma Xi. He was instructor in electrical engineering at Polytechnic Institute from 1929 to 1931; Du Pont Fellow at Massachusetts Institute of Technology in 1932 and now is research associate in electrical engineering at that institution.

The wedding will take place in September after Dr. Trump's return from Russia. He will leave early in June as the guest of the Academy of Science of the U. S. S. R. to discuss his work in vacuum electrostatic power transmission.

REAL ESTATE

In Flushing

SUBSTANTIALLY built, this house is one of the Bobrose Homes on 169th St. and 25th Ave., Flushing.

Builders Report No Sales Let-up On Long Island

The following pithy, not to say pertinent, paragraphs concern builders and sellers of homes out Long Island way, where activity, as the saying goes, is marked.

Returning from Florida Fred Trump of the Metropolitan Investors, Inc., found only one home remaining unsold in the development at 82d St. and 132d Ave., in Tudot Village, Woodhaven.

Additional sales of Bell Homes, on 178th Place and 119th Ave., St. Albans, were reported by Edward

Interior view of one of Bell Homes in St. Albans.

Jensen, sales director. Nathan Krader, the builder, plans to complete six more interiors within the week, the exteriors recently having been finished.

Six built-to-order Flushing Colonial homes have been sold recently, according to Louis Bright, builder of the houses on 189th St. and 48th Ave., Flushing.

Invading a lower price field, H. Heller and A. Edkiss, the men behind Paramount Homes, are starting construction of a new group of houses in Flushing. They are confining their activities to Hollis Court Boulevard, 53d Ave. and 195th St., where they have built up a large community in the past four years.

Keen interest has been displayed in the new brick and stone Crestwood Homes at 206th St. and 34th Ave., Bayside.

Merrick Homes, Inc., builders at Merrick Gables, Merrick, L. I., announces the approval by the FHA of insurance on a first mortgage loan on the home recently completed for Mae E. Holland. The home purchased for

New! $6250

(Due to unusual circumstances)

Houses of same construction, type and size on same street sold for $8500 and higher.

PLOT 50x100

ENGLISH type stone, brick and concrete home and garage, 6 large rooms in addition to breakfast room, den or sewing room and attractive basement room, beautiful bath with separate shower stall, extra lavatory and all modern construction and equipment features, excellent train service, convenient to stores, churches and schools. Easy terms can be arranged.

MILTON SIRKIN

1939-05-28- financial decisions - Eccles vs Alexander Sachs

Full newspaper page : [HN0170][GDrive]

ON THE RECORD

By Dorothy Thompson

Now, about this gambling business. In his speech last Monday night the President accused the critics of his fiscal policies (among them "high-brow columnists and high-geared economists") of being "eager to gamble the safety of the nation." The New Deal, he said, is conservative. "We cannot bring ourselves to take radical chances with other people's property. . . . We do not have the right to gamble with the well-being of 120,000,000 Americans."

Miss Thompson

This statement would seem to indicate that the New Deal has, and has had, a consistent policy arrived at without benefit of high-brow columnists and high-geared economists and that that policy has worked, and, therefore, the New Deal is sticking to it.

Actually, the New Deal has had three separate policies, each of which has been winsomely presented to the public, and each of which has had the support of some high-geared economists and some high-brow columnists—if you count my friend Heywood Broun as a high-brow! Heywood has believed in the infallibility of all three of them.

* * *

Bets Three Ways

There are radical differences in all of these policies put forward by an Administration which takes its name, the New Deal, from a gambling game. The New Deal has staked its money—I mean our money—on all three hands. And they can't possibly, all three, be winners in the same round.

The first was the fiscal policy enunciated in the special economy message of March 10, 1933. At this time Mr. Roosevelt was implementing his criticisms of the Hoover regime's waste and deficit policies.

1939-05-28-the-knoxville-journal-pg-4-clip-on-the-record

"We shall have piled up from the preceding fiscal years an accumulated deficit of $5,000,000,000. . . . It has contributed to the recent collapse of our banking structure. . . . Too often in recent history liberal governments have been wrecked on the rocks of loose fiscal policy. . . . I give you assurance that if this is done (proposed economy legislation) there is reasonable prospect that within a year the income of the government will be sufficient to cover the expenditures of government."

This is Mr. Roosevelt talking the language of high-geared conservative economists. Lewis Douglas and Dr. B. M. Anderson, of the Chase Bank, and high-browed columnist, Mark Sullivan.

But on January 3, 1934, the President had decided to put his money (our money) on another hand. This budget message was inspired by the theory of such high-geared liberal economists as Russell Leffingwell, of Morgan's.

Now, the President adopted the idea of the cyclical budget—the idea of compensatory government spending. The proposed increase in the deficit was to be so arranged and conditioned as to accelerate recovery and secure a balance within the business cycle.

"We should plan to have a definitely balanced budget for the third year of recovery, 1936, and from that time on seek a continuing reduction of the debt."

* * *

How Deficits Go

In the second budget message, of January 3, 1935, the President noted the continuing problem of unemployment and said:

"For this reason it is evident that we have not yet reached a point at which a complete balance can be obtained. . . . I am, however, submitting to the Congress a budget for the fiscal year of 1936. . . . Such deficit as occurs may be expected to decline."

In the message of January 3, 1936, he congratulated himself on the success of his policy.

"Our policy is succeeding. The figures prove it. Secure in the knowledge that steadily decreasing deficits will turn, in time, to steadily increasing surpluses. . . . Let us pursue the course we have mapped."

The year closed six months later with a record-breaking deficit of $4,361,000,000.

On January 8, 1937, there was another optimistic budget message.

"Business conditions have shown each year a marked improvement . . . the gains make it possible to reduce for 1938 many expenditures. . . . We expect in 1939 a completely balanced budget."

Immediately following this message the government embarked upon a drastic deflationary policy not radically reducing spending but increasing three times the Federal Reserve requirements and sterilizing gold.

This move was supported by conservative high-geared economist Winthrop Aldrich and by Marriner Eccles, and was protested by high-geared liberal economists Parker Gilbert, of Morgan's, and Alexander Sachs, of Lehman Corporation. Mr. Morgenthau also looked a little sour.

Low- or high-browed columnist Dorothy Thompson and others predicted a depression, on the argument that the deflation was wildly drastic, that it was a mistake to undertake it unless accompanied by the release of capital, a radical change in the tax structure, and a revival of business confidence, which had been seriously, though indirectly shaken by the attack on the Supreme Court.

Columnists were reprimanded for pessimism.

There was a depression, eventually admitted by the government.

* * *

In January, 1938, a new policy takes form. The budget is going to be balanced when and if the national income has grown to the "requisite amount." High-geared economists, some of whom supported policies 1 and 2, are notably absent in expressions of enthusiasm for No. 3.

High-brow columnists who saw merit in 1 and 2 are almost all "from Missouri" on 3.

BROOKLYN'S MAN OF THE WEEK:

Trump the Builder Plays Mothers as Ace Cards

By RICHARD J. ROTH

Mother's Day is more than a once-a-year proposition so far as Fred Trump is concerned. The builder of Brooklyn's two new housing giants, Shore Haven at Bensonhurst and Beach Haven at Brighton, tries to keep mother in mind the other 364 days as well. And with good reason.

Trump has found that, while it may be papa who pays, it's mama who makes the decision on where the money is going in more than four out of every five apartment rentals.

"In 85 percent of our rentals the final decision has depended on the woman's say-so," the 44-year-old former carpenter's helper pointed out in his field office at the rapidly rising Beach Haven development. "The husband cares only about the convenience of transportation and whether his wife likes the apartment."

Emphasis on Labor Saving

With those statistics firmly in mind Trump built the 1,350-apartment Shore Haven development and is rushing to completion the 1,800-unit Beach Haven development with more than a nod in the direction of what he terms "the woman's point of view." The emphasis is on labor-saving conveniences and other features designed to appeal to the distaff side of the family, particularly to mothers with young children.

Fred C. Trump

At Beach Haven, for example, Trump has provided a building and 6,000 square feet of land at a $1-a-year rental, including heat, for the Board of Education. A unique kindergarten and first-grade school exclusively for residents of the development will be opened.

Baby-Sitter Service

Other innovations include an organized baby-sitter service, using girls from Abraham Lincoln High School, which is directly opposite the Brighton Beach development at Ocean Parkway and Shore Parkway. Also planned are a "courtesy car" bus service to the beach for those who prefer to ride, and ultra-violet clothing driers in the basement laundry rooms in each of the 23 buildings, thus eliminating the roof driers which, the builder declared, are "left over from an old-fashioned era."

A modern $300,000 shopping center, with 14 stores and a 250-car parking area, also is about to rise on Beach Haven property. Other parking spaces will be provided on the landscaped grounds, as well as playground and bench areas, with only 20 percent of the project covered with buildings. Heated garages, with a total capacity of 650 cars, are being constructed in the basement of every building.

'Renting Honeymoon Over'

Why all this consideration for the residents? an amazed veteran of the housing shortage might ask, and in this case, did. The answer, according to Fred Trump, is simple:

"We realize that the renting honeymoon is over. We're attempting to make a real step forward to attract the type of tenant who will appreciate these extra services. Our innovations, we hope, will make for a happier housewife, a happier home life, and a resultant happier community."

Fred Trump was born in the Bronx on Oct. 11, 1905, the son of a former Klondike restaurant operator. After the gold rush of '98 had subsided the elder Trump had dabbled on a small scale in the real estate business.

Started in Queens Village

The Trumps moved to Woodhaven shortly after Fred was born and he attended Richmond Hill High School. At 18, following graduation, he took a job as a carpenter's helper, supplementing this practical experience with courses in building construction three nights a week in the Y. M. C. A. Then he went out on his own.

The first Trump homes began to go up in Queens shortly afterward, about 400 or 500 one-family units in the Queens Village area. Then, after 1932, when home building was at an ebb, Trump was awarded, in Federal Court, the mortgage servicing for the bankrupt Lehrenkrauss financial empire.

This took up much of his time for a year. And he operated one of the first self-service food markets, building it up into a profitable large-volume business before leasing it to a well-known food chain.

Sold 78 Homes in 20 Days

In 1935 Fred Trump moved his operations to Brooklyn, picking a site at Avenue H and Kings Highway. On Nov. 10 he completed the model home; within the next 20 days he sold all 78 of the $3,990 homes, a price which was then about half the average rate.

Those 78 homes have been followed by close to 2,500 in the last 15 years in Flatbush, Manhattan Beach and Bensonhurst. During the war he built 1,400 apartments for war workers at Norfolk and Newport News, Va., and Chester, Pa. Shore Haven was opened in June, 1948, and Beach Haven, begun last November, will be completed in a phenomenal year's time.

Much of Trump's success in his Brooklyn building can be attributed to his pioneering in the field of pile-driving, which permits construction on filled-in land. Beach Haven, for example, is built on land that was once marshy. It is atop 55-foot creosoted logs, each of which can sustain a 25-ton load, five times the required burden.

The good-looking builder was married in 1936 to a Scottish-born girl whom he met at a party. They have five children, ranging in ages from 2 to 13.

[...]

John George Trump (August 21, 1907 – February 21, 1985) was an American electrical engineer, inventor, and physicist. A professor at the Massachusetts Institute of Technology from 1936 to 1973, he was a recipient of U.S. President Ronald Reagan's National Medal of Science and a member of the National Academy of Engineering.[3][4][5] John Trump was noted for developing rotational radiation therapy.[3] Together with Robert J. Van de Graaff, he developed one of the first million-volt X-ray generators. He was the paternal uncle of Donald Trump, who would later go on to become the 45th president of the United States.

Early life

Trump was the youngest of three children and the second son of German immigrants Frederick Trump and Elizabeth Christ Trump. He was born in New York City on August 21, 1907.

John's brother, Fred, joined their mother in real estate development and management while still in his teens (Elizabeth Trump & Son). **Initially, John and his brother tried working together building houses, but ultimately they dissolved their partnership, and John pursued a career in electrical engineering.**

Trump received his bachelor's degree in electrical engineering from the New York University Tandon School of Engineering (then Polytechnic Institute of Brooklyn) in 1929, his master's degree in physics from Columbia University, and his doctorate of electrical engineering from the Massachusetts Institute of Technology (MIT) in 1933. He was a professor at MIT from 1936 until 1973.

War service

During World War II, Trump switched from work on hospital X-ray machines to research into similar technologies with a more direct application to warfare, especially the development of radar. During 1940, he joined the newly formed National Defense Research Committee (NDRC), as technical aide to Karl Compton, President of MIT and the Chairman of the Radar Division.[6]

During 1942, Trump became Secretary of the Microwave Committee, a sub-committee of the NDRC. The director of the Microwave Committee was Alfred Lee Loomis, the millionaire physicist, who decided to create a laboratory. He selected a site for it, chose a suitably discreet and ambiguous name for it and

funded the construction, until the Federal administration was established. The new institution was the MIT Radiation Laboratory, or the "Rad Lab". The British were also researching radar, which they termed Radio Direction Finder (RDF), and had started much earlier. Their Tizard Mission to the US showed how much more sophisticated they were with some of the technologies, particularly the magnetron. The US decided to send a team to Britain to help coordinate the efforts of the two Allies. The unit was known as the "British Branch of the Radiation Laboratory" (BBRL) and operated as a department of Britain's Telecommunications Research Establishment (TRE) at Malvern, in Worcestershire. In 1943, as the technical aide in Division 14 of the NDRC, Trump reviewed and analyzed the papers of Nikola Tesla when the inventor died in a New York City hotel. The research was completed on behalf of the Alien property Custodian office in Washington DC. From February 1944 to the end of the war in Europe, Trump was the Director of the BBRL.[7]

During this time, Trump also served in the Advisory Specialist Group on Radar, advising USAAF General Carl Spaatz on navigational radar, precision-bombing radar, and also defenses against the German radars found in their night-fighters and in their flak units. The systems included: Gee, Oboe, LORAN, H2X, MEW & SCR-584. Trump worked with all the most important British radar experts, including Sir Robert Watson-Watt, A.P. Rowe and Bernard Lovell. At the end of the war, Trump also had interviews with Germany's main radar technicians.[8][9] Trump received recognition for his war-work from both the United States and the United Kingdom.[10][11][3]

Family

John G. Trump is a member of the Trump family. He married Elora Sauerbrun (1913–1983), and they had three children: the late John Gordon Trump (1938–2012) of Watertown, Massachusetts; Christine Philp of New London, New Hampshire; and Karen Ingraham of Los Alamos, New Mexico; and six grandchildren.[3][12] Trump's nephew Donald John Trump became the 45th president of the United States in 2017.

Later life

During 1946 Trump, Robert J. Van de Graaff, and Denis M. Robinson initiated the High Voltage Engineering Corporation (HVEC) to produce Van de Graaff generators.[3]

He returned to MIT to teach and direct research for three decades after the war. Trump died in Boston on February 21, 1985.[13]

The National Academy of Engineering described Trump as "a pioneer in the scientific, engineering and medical applications of high voltage machinery".[4] James Melcher, Trump's lab director, is quoted as saying: "John, over a period of three decades, would be approached by people of all sorts because he could make megavolt beams of ions and electrons – death rays. ... What did he do with it? Cancer research, sterilizing sludge out in Deer Island [a waste disposal facility], all sorts of wondrous things. He didn't touch the weapons stuff."[14]

Awards and honors

Trump received a number of awards including:

- 1947: The King's Medal for Service in the Cause of Freedom (KMS), given by George VI
- 1948: The President's Certificate of Merit, presented by President Harry S. Truman
- 1960: The Lamme Medal, given by the American Institute of Electrical Engineers
- 1983: The National Medal of Science, presented by President Ronald Reagan

1985 (Feb. 26)- Obituary - NY Times - "JOHN TRUMP DIES; ENGINEER WAS 78"

https://www.nytimes.com/1985/02/26/us/john-trump-dies-engineer-was-78.html

1985-02-36-nytimes-john-trump-dies-engineer-was-78.pdf

Dr. John G. Trump, a retired teacher and engineer, died Thursday at his home in Cambridge, Mass., after a long illness. He was 78 years old.

Dr. Trump began studying the voltage-insulation properties of high vacuum and compressed gases while a faculty member at the Massachusetts Institute of Technology. Working with Prof. Robert J. Van de Graaff, he designed one of the first million-volt X-ray generators. Used initially for clinical purposes at the Collis P. Huntington Memorial Hospital in Boston in 1937, it was a development that provided additional years of life to cancer patients throughout the world.

In 1946, Dr. Trump, along with Dr. Van de Graaff and Dr. Denis M. Robinson, founded the High Voltage Engineering Corporation, which developed the Van de Graaff electrostatic generator.

In World War II Dr. Trump was influential in the development of radar and short-wave radar equipment. He was appointed director of the British branch of the M.I.T. Radiation Lab in 1944.

After the war. Dr. Trump, while still on the faculty at M.I.T., became associated with the Department of Radiology at the Lahey Clinic in Boston and later became chairman of its board. Under his direction rotational radiation therapy was developed, "an idea that created quite a stir in those days," he recalled later. He also conceived and developed the use of high-energy electrons in the treatment of superficial skin lesions.

He Received Emeritus Status

He became professor emeritus at M.I.T. in 1973, remaining on as a senior lecturer.

He was the author of nearly 80 scientific publications and the recipient of many awards, including His Majesty's Medal, given by George VI in 1947; the President's Certificate of Merit, presented by President Truman in 1948; and the Lamme Medal, awarded in 1960 by the American Institute of Electrical Engineers. In 1983, he was the recipent of the National Medal of Science.

He was a graduate of the Polytechnic Institute in 1929, received a master's degree in physics from Columbia University in 1931 and a doctorate from M.I.T. in 1933.

Dr. Trump is survived by three children, John Gordon Trump of Watertown, Mass., Christine Philp of Pittsfield, Mass., and Karen Ingraham of Los Alamos, N. M.; and six grandchildren. He was the brother of Frederick C. Trump and the uncle of Donald Trump, New York real estate developers.

A funeral service will be held Sunday at 2:30 P.M. at the Unitarian Church in Winchester, Mass.

THIS CITY EDITOR TOTES A GUN

When the city editor gets "mad" at a reporter, he pulls a gun on him. This, at least, is part of the play, "Copy," presented by the Play Workshop, dramatic organization of the Brooklyn Polytechnic Institute, on Saturday night. The above scene shows John K. Honish, as the city editor, getting "mad" at John G. Trump, a reporter. Trump's colleague, William Eglit, is attempting to defeat the nefarious purpose.

Two other one-act plays were presented. Others in the casts were: Philip E. Hagerty, Fernando R. Rojas, Richard Minetti, Vincent Garzia, jr.; Joseph Heller, S. L. Duhamel, Philip Brockington, Thomas Aguire, Solomon Perlman, F. Alan Coogan, Herman F. Steen, Leon K. Danner, C. H. Buccola, Frank Campbell, Vincent Longobardi, Alfonso Abbate, Victor Plavin, Edmund Burke, Mitchel Haifter and Roger Hess.

DELEGATE

JOHN G. TRUMP

GOING FROM BORO TO STUDENT FORUM

Adelphi College and Poly Institute Undergraduates to Attend National Meeting.

Brooklyn colleges will be represented at the fourth annual convention of the National Student Federation of America, to be held at the University of Missouri on December 13, 14 and 15 by Misses Ester Ewart and Helen McKinney, of Adelphi College, and John G. Trump, of Polytechnic Institute.

Delegates from more than 200 colleges and universities throughout the country will gather at the convention for the purpose of bringing about a better realization and solution of student problems through discussion and interchange of experiences. Prominent educators have realized the value of the work of the Federation, and are cooperating with it in its effort toward student self-expression. This year the Federation is headed by E. H. Miller, of Washington and Lee University, who has secured as convention speakers Henry W. L. Dana, former professor of comparative literature at Harvard and Columbia; Walter Williams, nationally known journalist, and Norman Thomas, Socialist candidate for President.

Miss Ewart and Miss McKinney are both actively engaged in student affairs at Adelphi. Besides being president of the Student Council Miss Ewart was president of her class in her sophomore year and captain of the varsity basketball team. She is a member of the Lantern, Adelphi's honor society.

Miss McKinney, now in her junior year, is vice-president of the Student Council and was president of the sophomore class. She is taking an active part in the dramatic work of her school and is a prominent member of the swimming team.

Mr. Trump is planning to bring up for discussion several problems in technical education and has an active program laid out for himself.

Boston, June 8.—John G. Trump of Jamaica, L. I., received the du Pont Fellowship for graduate study at the annual commencement exercises of the Massachusetts Institute of Technology here yesterday.

In all 698 degrees were conferred at the 65th annual commencement. Sir Henry Thornton, president of the Canadian National Railways and formerly connected with the Long Island Railroad, delivered the commencement address, in which he declared this country is "vastly fortunate in having a safe and sane government put into power by an intelligent people." He said the world is passing through a psychic epidemic such as has been charted in history following periods of great mental excitement, and predicted the emergence of a new social, political and financial structure.

THURSDAY, JUNE 22, 1961

LEO E. A. SAIDLA, AN EDUCATOR, 72

Former Department Head at Brooklyn Polytechnic Dies

Special to The New York Times.

STONY BROOK, L. I., June 21—Prof. Leo Erval Alexandre Saidla, educator, author and minister, died this morning of a cerebral hemorrhage at Huntington Hospital, Huntington. He was 72 years old.

Mr. Saidla, who retired in 1955, had moved recently to Stony Brook from the Village of Huntington Bay.

At his retirement, he was chairman of the Department of English and Psychology at Brooklyn Polytechnic Institute, a post he had held since 1947.

He was the author of "Essays for the Study of Structure and Style" and "Present-Day Punctuation." He also was co-author of "Jean Jacques Rousseau and His Philosophy," "Science and the Scientific Mind" and "Engineers and Writers." At his death he was working on "Platonism of Dante."

A native of Lebanon, Ind., he received his Bachelor of Arts degree at Wabash College in 1909 and a Bachelor of Divinity degree at Union Theological Seminary in 1912. He was ordained as a minister of the Presbyterian Church the following year and engaged in settlement work in the Chicago Commons. He later became minister at St. John's of Lattingtown Protestant Episcopal Church.

Mr. Saidla left the ministry to serve as a private overseas with the Army Medical Corps during World War I. After his discharge from service, he studied at the University of Poitiers in France and, upon returning to the United States, at Harvard and the American Academy of Dramatic Arts. He received a Master of Arts degree at Columbia University in 1925.

He was assistant and associate professor of English and director of play productions at Alabama Polytechnic Institute from 1920 to 1923. In 1924, he taught French at New York University and served on the faculty of the Rand School of Social Science.

Later that year, he become an English instructor at Brooklyn Polytechnic Institute. Mr. Saidla was a member of many educational and scientific societies.

He is survived by his widow, the former Mary Fayette Driggs; a son, Glen E.; a daughter, Mrs. Charles W. Morse Jr., and a sister, Mrs. Leslie F. Widener.

BROOKLYN DAILY EAGLE,
NEW YORK, FRIDAY, DECEMBER 28, 1934

SAUERBRUN—TRUMP

Mr. and Mrs. Arthur Sauerbrun of 9222 177th St., Jamaica, announced the engagement of their daughter, Miss Elora Gordon Sauerbrun, to Dr. John George Trump, son of Mrs. Frederick Trump of 175-24 Devonshire Road, Jamaica, at a tea at their home Wednesday. Miss Ann Hopkins and Mrs. Ogden Avery Keep poured tea.

Miss Sauerbrun is a graduate of Jamaica High School and received the degree of Bachelor of Music Education from the Institute of Musical Art of the Juilliard School of Music in 1933. She is a past president of the Crescendo Club of Jamaica and is active in the Senior Crescendo Club and the Fortnightly Club of Hollis. She is well known in musical circles as a pianist and accompanist.

1934-12-28-the-brooklyn-eagle-pg-17-clip-trump-sauerburn

Dr. Trump received the degree of electrical engineer from Polytechnic Institute in 1929; Master of Arts degree from Columbia University in 1931 and the degree of Doctor of Science from Massachusetts Institute of Technology in 1933. He is a member of Alpha Chi Rho and the national honorary fraternities Tau Beta Pi and Sigma Xi. He was instructor in electrical engineering at Polytechnic Institute from 1929 to 1931; Du Pont Fellow at Massachusetts Institute of Technology in 1932 and now is research associate in electrical engineering at that institution.

The wedding will take place in September after Dr. Trump's return from Russia. He will leave early in June as the guest of the Academy of Science of the U. S. S. R. to discuss his work in vacuum electrostatic power transmission.

PROGRESS ON TUBE PROMISES SUCCESS IN SMASHING ATOMS

Pres Compton of M. I. T. Reports on Gains Made At Round Hill—Experiments to Begin Now

1935-05-24-the-boston-globe-pg-10-clip-smashing-atoms

The smashing of atoms by the Van de Graff 7,000,000-volt generator is expected to take place in the near future at the Massachusetts Institute of Technology experiment station at Round Hill, Mass, it was announced last night by Pres Karl T. Compton as he reported the successful completion of the first unit of the disintegration tube at a meeting of the board of directors of the Research Corporation in New York.

With the completion of the first part of the vacuum tube that must be attached to the high voltage generator before the disintegration of atoms can take place, experiments on low voltage distintegration methods can begin at once it was announced. Many improvements in the generator itself have been made in the past few months, Dr Compton stated. It has been equipped with accurate voltage and current controls as well as vibration eliminators.

New X-Ray Tube

A new high voltage X-ray tube, operating at 700,000 volts and which is expected to prove a valuable instrument in hospitals was also announced by Dr Compton as the product of the research taking place in the high-voltage laboratories of the institute at Cambridge. The extremely penetrative rays of this high-voltage tube have their practical application in the treatment of internal cancer.

The advantage of the new equipment over previous X-ray outfits of similar voltage are cheapness and simplicity of construction, ease and accuracy of control and lastly, the most important fact, that it runs continuously at the high voltage, giving a much improved quality of X-rays. The X-ray tube investigations have been carried out by Dr John G. Trump.

The giant electrostatic generator built at Technology's research station at Round Hill by Dr Robert J. Van de Graaff and his associates, Dr Lester and Chester van Atta, has been perfected to the extent that now all that it needs to go into the atom disintegration business is a vacuum tube. Dr Van de Graaff and his assistants have been engaged on the design and construction of this tube all Winter and have already completed the first unit.

Problem of Major Proportion

The design of the vacuum discharge tube to handle large currents at several million volts is a scientific and engineering problem comparable to the design of the generator itself. The tube will consist of five identical units, joined end to end extending from one sphere or electrode of the generator to the other. The bombarding particles are introduced at one end, after the tube has been evacuated of all traces of air, are accelerated to high speeds by the 7,000,000 volts, guided down the tube by metal shields, and made to impinge on the atoms that are to be disintegrated. The great impact that results from the collision will, it is expected, disrupt the atoms.

One of the difficult problems to be solved in the design of the tube was to maintain what is called a proper voltage distribution by means of electrical leakage. Many months of experimentation were required to develop resistors capable of transmitting the requisite amount of current at the enormously high voltages and still maintain a constancy of operation.

In the Cambridge laboratories of the Institute Dr John Trump has been concentrating the use of a vacuum as an electrical insulator. Results of this investigation are expected to be of

Full page : [HN00XG][GDrive]

ROCHESTER DEMOCRAT AND CHRONICLE, THURSDAY, OCTOBER 1, 1936

Ray Found to Revolutionize Cancer Work, Doctor Hopes

Cleveland—(AP)—A new machine capable of producing 1,000,000 volt X-rays with an intensity greater than all of the available radium in the world was announced yesterday before American Roentgen Ray Society.

Dr. Richard Dresser of Huntington Memorial Hospital, Boston, told the society the mammoth electrostatic generator, new being installed in the hospital, gave promise of successful treatment of many malignant diseases which fail to respond to the comparatively low voltage ray machines now in use.

Doctor Dresser exhibited a small two-foot model of the apparatus, capable of generating 250,000 volts, and Dr. John G. Trump, professor of engineering at Massachusetts Institute of Technology, demonstrated its operation.

Doctor Dresser explained the machine is superior to any x-ray device now in use in two respects. It makes possible treatment of deep-seated malignant growths in the body, including cancer, because the high voltage x-rays penetrate deeply; and these rays have been found to be more specific in their action of ionizing and destroying diseased tissues than low-voltage rays. In this respect, he added, the high power rays are similar to Gamma rays emitted by radium.

The priniciple of the machine is generation of static electricity, the same as is produced when the hair is combed with a rubbed comb.

In the large machine, as in the model exhibited here, six fast-moving vertical belts carry negative electricity to the highvoltage terminal in the doughnut-shaped top and on the downward path remove positive electricity from the terminal, depositing it at the grounded base.

THE BOSTON GLOBE—FRIDAY, NOVEMBER

DR HAUSER TALKS AT SCIENTISTS' DINNER

Three-Day Conference Opens at M. I. T.

Dr Ernst A. Hauser, of M. I. T. spoke on "Colloids," at the annual dinner of the National Research Council, division of engineering and industrial research, committee on electrical insulation, last night at the Copley-Plaza. More than 200 scientists were present. Dean John B. Whitehead of Johns Hopkins University presided.

The banquet was the concluding feature of the opening day of a three-day session of the ninth annual conference of the scientists in the George Eastman Laboratory at Technology.

Dean Vannevar Bush, vice president of M. I. T., delivered the address of welcome at the morning session, and at the banquet last night extended the courtesy of M. I. T. to the scientists, many of them nationally prominent in electrical engineering.

At the two sessions yesterday, 17 technical papers were presented. Dr Whitehead presided.

Chairman Jayson C. Balsbaugh was in charge of the arrangements for the conference and many new features of recent developments in the field of electrical insulation were described in the various technical papers. They dealt with "deterioration, by oxidation and moisture of insulation used for high voltage cables." Among those who presented papers was Dr John Trump, young M. I. T. electrical engineering professor, who, it was recently announced, designed the huge X-ray machine being built at the Collis P. Huntington Memorial Hospital in Boston, and expected to be of great aid in the treatment of cancer. Dr Trump's paper was entitled, "Properties of Vacuum Insulation."

Among those attending the conference are A. V. Astin, National Bureau of Standards; L. J. Berberich, Sun Oil Company; John T. Blake, Simplex Wire and Cable Company; Dr Walter G. Cady, Wesleyan University; W. F. Davidson, Consolidated Edison Company of New York; Prof Chester L. Dawes, Harvard; Dr J. V. Fast, Socony-Vacuum Corporation, New York; Dr Eugene W. Greenfield, Anaconda Wire and Cable Company; Dr Edwin M. Guyer, Corning Glass Works; Dr Charles F. Hill, Westinghouse Research Laboratories; Dr Vladimir Karapetoff, Cornell University; Prof Edward L. Moreland, head of the department of electrical engineering at Technology; Dr Hans Mueller, M. I. T.; Dr Ellery B. Paine, University of Illinois; John D. Piper and Kenneth S. Wyatt, Detroit Edison Company, and Dr Arnold H. Scott, National Bureau of Standards.

Assisting in presentation of the program at the three-day scientific discussions are Dean A. Lyon and Dr Robert G. Larsen, both of the staff at Technology.

World's Mightiest Gamma Ray Generator Dedicated at Hospital

Exceeding in power the combined output of all the available radium in the world, a new 1,000,000 volt X-ray machine for the treatment of cancer was dedicated yesterday at the Collis P. Huntington Memorial Hospital, Huntington av.

The new machine is known technically as an electrostatic generator. It was designed by Dr John G. Trump and Dr Robert J. Van de-Graaf of M. I. T.

The dedicatory exercises were attended by about 100 leaders in the fields of science, education and social welfare. Among them were Pres James Bryant Conant of Harvard and Pres Karl T. Compton of Technology.

"This new medical tool, the most powerful ever built, is unlike any instrument hitherto developed for the X-ray treatment of cancer," said Dr Richard Dresser, roentgenologist at the Huntington Hospital.

Dr Dresser said it would take 2000 grams of radium, which would cost $60,000,000—could it be bought—to produce the gamma rays having the effectiveness of the X-rays developed by this new generator.

Resembling a giant mushroom of polished aluminum, the generator stands 15 feet high. Its rounded top, comprising the huge electrode, is 15 feet long, 12 feet wide and five feet deep.

The visitor has the impression of being in a terrific lightning storm as he peers into the dark room where huge electrical flashes play and snap between the electrode and the spherical terminal.

Through a huge tube the powerful current is led to a heavily lead-insulated treatment room underground, where it is focused on the patient, in perfect safety.

The Huntington Hospital is operated by the Cancer Commission of Harvard University and gains a large percentage of its support from Greater Boston's Community Fund.

This hospital is one of the nation's important cancer research centers. On its staff are Dr Channing C. Simmons, surgeon-in-chief; Dr Joseph C. Aub, physician-in-chief, and Dr Dresser, roentgenologist.

The Huntington Hospital was one of the first in the country to use radium and X-ray in the treatment of cancer.

Atom May Provide Short Cut To Make Artificial Lightning

NEW YORK (UP)—A scientist has suggested that atomic energy may be used directly to operate electrostatic generators, machines so powerful that they can create artificial lightning.

The scientist, Dr. John G. Trump, associate professor of electrical engineering at the Massachusetts Institute of Technology, was one of a group discussing methods of producing electric power at the annual meeting of the Institute of Electrical Engineers.

If such an electrostatic machine could be given power directly from atomic energy it would be a decided short cut toward the goal of science to use atomic power for industrial purposes.

Most present plans would utilize atomic energy to heat water and create steam, which would in turn operate electromagnetic motor generators.

Dr. Trump pointed out that the most direct and powerful forces in nature, including those holding atoms together, are electrostatic in nature, and that electrostatic machines "may be uniquely able to utilize directly the energy of nuclear fission."

He also said that new developments may result in improved, smaller models of the electrostatic generator which probably will be sealed inside air-tight containers and operate in a high vacuum.

Gases at high pressures are now employed for high-voltage insulation, Dr. Trump recalled, and he said that substitution of high vacuums as the insulating medium, if perfected, would make possible considerable reduction in generator size.

This would carry the application of such machines a step further, and they would have an advantage over electromagnetic power devices in that they could generate and use power directly at high voltage.

This, according to Dr. Trump, might well eliminate two "middle men" in the transfer of atomic power to industrial machines—heating of water, and making of steam.

Tech Staff to Aid Vienna Institution

On the suggestion of Ex-President Herbert Hoover and Dr. Vannevar Bush, president of the Carnegie Institute, the faculty and staff of the Massachusetts Institute of Technology have "adoped" their opposite number of the Technische Hochschule in Vienna.

Food and clothing will be sent by the M. I. T. group through the Unitarian service committee, 9 Park st., and will be distributed, according to Prof. John G. Trump, president of the M. I. T. Faculty Club, by the representative in Vienna of the Unitarian committee.

More than $1000 has already been collected, Prof. Trump said, and will be used for immediate shipment of needed food. A clothing collection will follow. He emphasized that this is to be a "continuing effect to help M. I. T.'s sister institution." Everett M. Baker, dean of students, is chairman of the Technische Hochschule relief committee.

New M.I.T. Machine To Split Heavy Atoms

CAMBRIDGE (AP) — Construction of a 12,000,000-volt electro-static generator designed to split the heaviest of atoms was announced yesterday at the Massachusetts Institute of Technology.

Dean of Science George Harrison said the machine, several times more powerful than any known apparatus of its type in existence, "will have sufficient energy to penetrate and break up the heaviest of nuclei."

The new generator has been developed mainly by Dr. John G. Trump and his associates in the department of electrical engineering, he said.

It is a modification of the original Van de Graaf generator—somewhat smaller but capable of producing six times as much voltage.

A product of M.I.T.'s laboratory for nuclear science and engineering, the machine will also probe the biological effects of high energy radiation, according to Dean Harrison.

THE BOSTON DAILY GLOBE—FRIDAY, DECEMBER 5, 1947

Super X-Ray Cancer Therapy Described to Radiologists

Encouraging results from treating cancer patients with the 3,000,000-volt X-Ray machine at Massachusetts Institute of Technology were described today to the 1700 delegates at the Radiological Society of North America's concluding conference of a six-day meeting at Hotel Statler.

Dr. Richard Dresser of Beacon st., Boston, described to his conferees the work done when the super-ray machine was first completed, six years ago, and when therapy for patients was resumed in 1946. During the war the great machine, 20 feet high and inclosed in a ray-proof tank on the grounds of M. I. T., was allocated exclusively for research in physics for the United States armed services.

"We find the results in deep-seated malignancies are better with this 3,000,000-volt machine than with the use of the ordinary 200,000-volt machine," stated Dr. Dresser.

He described in technical terms the encouraging results obtained in treating cancers of the uterus, lung, mouth and neck but warned against over-optimism on the part of the public or patients as the work is still in the experimental process.

"The radiologist necessarily has to deal with a large number of patients considered hopeless from any other standpoint (in other words, inoperable cases).

"He knows from experience that many of these patients will attain much palliation (relief from pain) and some will be cured.

"It is largely a question of trial and error and every patient radiated must be treated as an individual problem" concluded Dr. Dresser.

The 3,000,000-volt machine, encased in its sealed tank is above the chamber in which the patient receives the radiation, which is beamed at the desired locality through the floor of the tank above him. Physicians and technicians observe and regulate the rays from outside both the tank and the chamber in which the patient is.

Dr. John G. Trump of Cambridge further developed points in connection with M. I. T.'s super-ray machine, stressing that the super-rays attain their maximum effect beneath the surface of the patient's skin, thus reaching deep-seated internal malignancies, and avoiding skin reactions.

"The absence of skin-reaction is a book to patients who are cured and who, under radiation at lower voltages, might have developed later radio-dermatitis."

Another form of attack on malignancies was discussed by Dr. James P. Steele of St. Louis, Mo., who described "multiple-capsule application" of radium in malignancies of the uterus. He said it afforded greater radiation possibilities and curative power.

Study of Blood Here to Probe Radiation Effects

A microscopic examination of the blood of doctors and employees of the X-ray department of the Massachusetts General Hospital will be undertaken to determine beyond what point exposure to radiation is dangerous.

The work is to be done as a memorial to Dr. Robert N. Nye, Boston cancer specialist and editor of the New England Journal of Medicine, who died last September from cancer.

A grant of $2,483.25 has been made the hospital for the work by the Massachusetts Division of the American Cancer Society from contributions to a memorial fund by friends and relativ eof Dr. Nye. Also to be studied is the known high incidence of leukemia (cancer of the blood stream) among X-ray workers.

The Memorial Study will be supervised by Dr. Laurence L. Robbins, radiologist-in-chief at the hospital, aided by Dr. Francis M. Hunter of the Baker Laboratory and Dr. John G. Trump, physics department, M. I. T.

NEW ATOM GENERATOR IS UNDER CONSTRUCTION

CAMBRIDGE, Mass., (INS) — A 12 million volt electrostatic generator to bombard the nuclei of atoms is under construction at Massachusetts Institute of Technology. Announcement of the new high-voltage generator, designed for atomic nuclei smashing at voltages several times higher than those produced by existing machines, was made by Dean George R. Harrison. Harrison said that atomic particles accelerated in the new generator will have sufficient energy to penetrate and break up even the heaviest of atomic nuclei.

A unique feature of the machine is that the energy of these fast-moving electrified particles will be readily variable from zero to maximum voltage to cover a wide range of experimental requirements. The new machine, an outgrowth of the Dr. Robert J. Van De Graaf original generator completed in 1933 a. the institute, has been developed largely through the researches of Dr. John G. Trump and his associates.

Five Million Volt X-Ray Machine to Be Used in Cancer

BOSTON, (INS)—The American Cancer Society has announced that radiation treatment of cancer may be greatly improved through a five million volt X-ray machine at Massachusetts Institute of Technology.

The machine is to be put into operation soon at the institute, where the first two million volt machine was put into use.

A grant from the society will make possible experiments with more powerful rays with which it is hoped to treat cancers which cannot be reached at lower voltages.

Under the new plan, scientists will be able to test therapeutic properties of the entire X-ray range from one to five million volts.

Deep X-ray therapy today usually used 200,000 volts, a voltage introduced ten years ago. About 30 percent of such rays penetrate four inches beneath the skin surface.

When the voltage is stepped up to 2,000,000 volts about 52 percent of the radiation is effective at four inches, and at 4,000,000 volts 64 percent is registered at this depth.

Dr. John Trump, head of MIT'S radiation work, said that radiation produced by two or three million vouts should be the preferred energy for deep seated cancers, but that some cases may receive greater benefit by still greater voltage.

Barbecue Method Adopted for X-Ray Of Cancer Patients

New Technique Allows Greater Use of Radiation

BY HOWARD W. BLAKESLEE

New York — (AP) — The American Cancer Society yesterday reported a new method of giving X-rays which works like barbecuing of roasts.

The patient sits on a turntable, which slowly revolves, while a beam of X-rays plays on him. The difference between this X-ray treatment and barbecuing is that the ray strikes only in a narrow zone around the body.

This new method is used to treat cancer deep within the body. The X-ray is focused so that its principal strength hits at about the site of the cancer.

Rays Focused on Site

Such rays, however, burn all the tissues through which they pass before reaching the deep cancer. Frequently the amount of X-rays which can be given the patient are limited by the amount of burning of the healthy tissues.

The burning of healthy tissues sometimes interferes so much that a patient's life cannot be saved.

By the barbecue method the X-rays remain focused on the cancer all the time, but are never on one spot of healthy tissues for long. This results in a wider area burned but in less severe burning in any one healthy area.

Beam Several Rays

This technique was developed at the Massachusetts Institute of Technology by Dr. John G. Trump, associate professor of electrical engineering. Dr. Hugh F. Hare of the Lahey Clinic, Boston, reported:

"This is the most promising method evolved so far of treating deep tumors susceptible to radiation, including many cases previously considered inaccessible."

The barbecue ray is two million volts, as penetration by X-rays depends on high voltage. As a substitute when the patient cannot be rotated on account of location of the cancer, several simultaneous beams are used. They enter from different angles. The healthy tissues are subjected to the burning effects of only one day, while the cancer gets the combined effect of several.

New Method Knocks Out Cancers

By ALTON L. BLAKESLEE

Cincinnati— (AP) —An X-ray merry-go-round has knocked out cancers in dozens of apparently hopeless cancer patients, the Second National Cancer Conference was told today.

Some have no signs of cancer 2 years later. But it's too soon to call any of them cured.

The merry-go-round is a revolving chair. The patient sits in it while a powerful 2-million-volt X-ray beam is aimed at his hidden cancer. As the patient spins slowly, the beam concentrates on the cancer. The spinning means less damaging Xrays on his skin and healthy tissues, and thus a bigger dose hitting the cancer.

The merry-go-round method was developed by Dr. John G. Trump and associates of Massachusetts Institute of Techonology, Cambridge, Mass., in research supported by the American Cancer Society. Patients are chosen and treatment guided by Dr. Hugh G. Hare, radio-ologist of the Lahey Clinic in Boston.

Details of results in the first 27 months with the merry-go-round beam were disclosed at the opening of the national cancer conference, bringing together more than 1,000 U.S. and foreign scientists and physicians to report latest advances in the campaign against cancer.

So far, 286 patients have been treated. The great majority had advanced cancer that couldn't be cut out or treated with usual X-ray methods.

Today, 157 have no signs of cancer, and some have been clear for 1 to 2 years. But cancer isn't considered cured until at least 5 years have passed with no recurrence.

Forty-seven have died, some of other diseases; 19 have cancers that spread, 12 have persistent cancers and in five the cancers returned. Another 46 are under treatment still or finished it too recently to be called free of the disease.

[HN00YB][GDrive]

1950 (April 14)

NEW CANCER TREATMENT MACHINE—Dr. Hugh F. Hare of the Lahey Clinic and Dr. John G. Trump of M. I. T. demonstrates rotational system of administering high-energy X-rays. Dr. E. W. Webster of M. I. T. acts as patient.

M. I. T. Uses 2 Million Volts in Treating Deep Cancer

Massachusetts Institute of Technology officials announced yesterday a new method of treating deep-seated malignant tumors, which combines the use of 2,000,000 volt X-rays with a rotational system of administration.

"This is the most promising method evolved so far of treating deep tumors susceptible to radiation therapy, including many cases previously considered inaccessible," Dr. Hugh F. Hare of the Lahey Clinic said.

Techniques developed and improved by Dr. John G. Trump, associate professor of electrical engineering at M. I. T., in research made possible by the American Cancer Society, have been used by radiologists of the Lahey Clinic and Massachusetts General Hospital in treating more than 50 patients in a special high-voltage X-ray laboratory at the Institute.

Dr. Hare said that "while the clinical disappearance of the malignancies under treatment have been most gratifying, it must be remembered that a period of years is required to prove any new method of cancer treatment."

Although it is a significant step forward in cancer treatment, Dr. Hare emphasized that many malignancies are too far advanced at the time of recognition and diagnosis to yield to this or other known treatment.

Evaluation Necessary

This high-voltage radiation treatment can only be recommended over other available forms of can- evaluation of each case, it was pointed out.

The 2,000,000-volt X-rays which are one important feature of the new procedure are produced by an cer therapy after careful clinical electrostatic generator developed by Dr. Trump and colleagues at M. I. T. and the High Voltage Engineering Corporation of Cambridge.

The use of gas at high pressure for insulating such high-voltage machines has made it possible to build compact generators which are now being used in hospitals and research centers. The machine in use at M. I. T. was the first commercially built model to be placed in operation.

"Two million-volt X-rays are fully equivalent in penetration and spectral composition to those from radium," Dr. Trump said. "The generator now in use has an X-ray output equal to that obtained from more than 4000 grams of radium, or twice the available world's supply."

Patients are carefully placed upon a rotating turntable in such a way that the sharply-defined X-ray beam continuously illuminates the diseased region. The rotation of the patient has the effect of reducing the dose delivered to regions outside the tumor.

Dr. Hare said that by this method reactions of normal healthy tissue near the diseased area are much less serious than with other methods of radiation. Only two of more than 50 patients to receive the treatment this far have had X-ray sickness, and in several instances gain in weight has occurred during the treatment, he said.

The new technique has been most effective in treating malignancies in the head, neck, throat, lungs, esophagus and uterus, Dr. Hare said.

M. I. T. Alumni to Hear Reports at Dinner Feb. 1

Reports on current and future activities at Massachusetts Institute of Technology will feature the annual mid-Winter dinner of the alumni Thursday at 6 p. m. in Walker Memorial.

Recent administrative developments will be discussed by Dr. James R. Killian Jr., president, and Dr. Karl T. Compton, chairman of the corporation. Marshall B. Dalton, general chairman of the Committee on Financial Development, will report on the progress of the institute's development program.

Research frontiers at M. I. T. will be described by Dr. Richard H. Bolt, director of the Acoustics Laboratory; Dr. John G. Trump, associate professor of electrical engineering, and Dr. Alex Bavelas, associate professor of economics. They will be introduced by Dr. George R. Harrison, dean of science.

John A. Lund of Cambridge, president of the M. I. T. Alumni Association, will preside. More than 1000 alumni are expected to attend, according to Donald P. Severance, secretary-treasurer of the association.

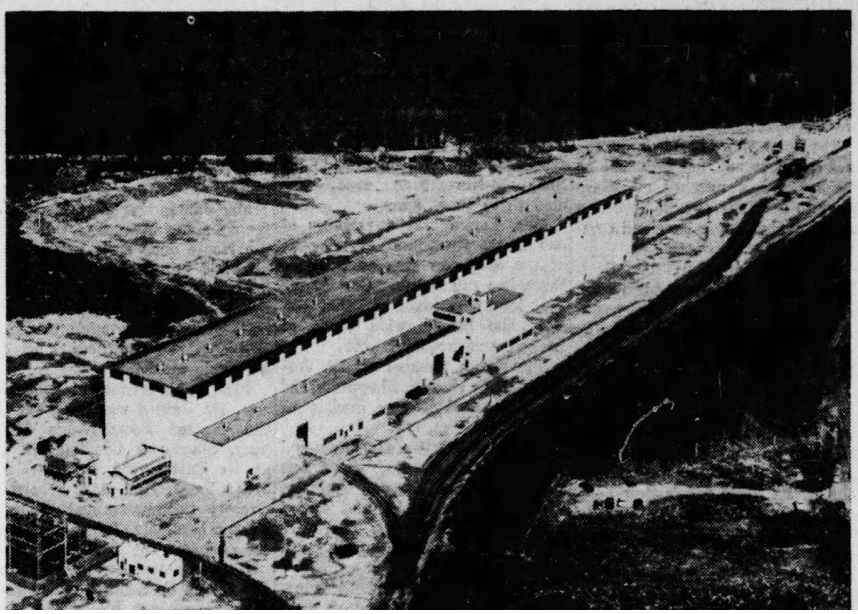
Newspaper Editors, Trade Paper Writers Inspect New $5 Million Foster Wheeler Plant At Mt. Top



The new $5 million Foster Wheeler fabricating plant at Mountain Top, showing the nearly-completed plant as it appeared when this aerial photograph was taken last week.

The Foster Wheeler Corporation held a press preview at its newly-constructed plant at Mountain Top yesterday for newspaper editors and trade paper writers.

One-hundred guests of the company were taken to Mountain Top in a special train from New York City over the Jersey Central Line. After a tour through the plant the guests returned to New York in the special train.

The Foster Wheeler Corporation, manufacturers of heavy equipment for steam power plants, oil refineries and process industries, has begun limited operations at the new plant. Due to the need for training new personnel, full operation of the plant is not expected before January 1, 1954.

When full scale operations are in force it is estimated that 500 men will be employed.

$5 Million Plant

Equipped with the most modern fabricating tools, the $5 million plant will turn out pressure vessels of varying proportions, including some of the largest and heaviest in demand. Part of an $8 million expansion and re-tooling program begun three years ago, the new plant will also help to relieve heavy manufacturing schedules at the corporation's other plants in Carteret, N. J., Dansville, N. Y., and St. Catharines, Ontario, Canada.

8,000-Ton Press

Among its major tools will be an 8,000-ton hydraulic beam press weighing over three million pounds and said to have an effectiveness in bending steel plate—hot or cold—seldom before equalled. Largest of its type yet made, the press is capable of bending plate eight inches thick, and (in the case of lighter plate) forty feet long into half-shells which, when welded together, will form pressure vessels of the unusual proportions required for the higher pressures demanded by various industries.

X-Ray Generator

Another outstanding tool will be a 2-million-volt Van de Graaff X-ray generator capable of penetrating steel 12 inches thick. The machine will photograph weld metal with unprecedented clarity of detail, exposing any minute flaws that may occur in the metal. Using fewer and shorter exposures, it will perform its work in considerably less time than conventional X-ray equipment. The Foster Wheeler unit will be the first application of super-voltage X-ray in private industry.

Manufactured by High Voltage Engineering Corporation of Cambridge, Mass., the generator was originally developed for cancer research, and later adapted for industrial use. It was put to its first practical test by the U. S. Navy during World War II, to determine construction details of enemy ordnance.

To guard against the possibility of escaping rays from the powerful machine, it will be housed in a fortress-like structure, with walls of reinforced concrete four feet thick, and removed 550 feet from the main plant.

Special Tools

Other special tools that will make up the new plant, although basically similar to many used in other steel fabricating plants, are unique in their capacity to perform monumental operations, or in their ability to perform familiar tasks automatically, and more efficiently. Among these are:

A new system of automatic shielded arc welding whereby vessels up to eight inches thick and 12 feet in diameter may be welded at of raised track. The drums to be drilled may be placed on either or both sides of the drill platform. The arrangement makes possible the use in combination of as many as six drills on a single cylinder.

To Fabricate Products

Foster Wheeler Corporation is fundamentally a manufacturer of heavy industrial equipment. This includes steam generating units, such as are used in central stations of public utility companies, as well as the condensing and fuel pulverizing equipment, heat exchangers, and evaporators required in such installations. Similar equipment is also furnished for marine service. The Foster Wheeler name plate is familiar to the operators of power plants aboard many of the vessels of the U. S. Navy, as well as leading passenger ships, freighters and Great Lakes cargo vessels. Delivering a complete oil refinery — including the design of the plant, fabrication of the equipment, and erection of the completed units—is another phase of Foster Wheeler activity. Chemical plants, which include manufacture of nitrogen from the atmosphere, synthetic ammonia plants, fertilizer plants and the like, are also designed and built by the company.

Chemical Plants

Many years ago, as the oil refinery industry advanced, knowledge gained by Foster Wheeler in power plant work was applied to the oil industry and more and more the services of Foster Wheeler were in demand by this industry. Today, almost 50% of its business is in oil refinery, and allied industries. In 1953, the largest refinery in Europe was completed under the supervision of Foster Wheeler engineers.

Refinery work soon led to the building of plants for chemical uses. Today, Foster Wheeler is the leading manufacturer of chemical plants for the production of agricultural ammonia in this country. In the chemical field, Foster Wheeler has developed processes for the manufactuer of ammonia, aromatics, Ethylene products, sulfur recovery, and synthetic fuel.

Chain Of Factories

Foster Wheeler is the outgrowth of two separate companies: Wheeler Condenser and Engineering Co., and the Power Specialty Company, each organized at the turn of the century. Each specialized in a different branch of power plant work—the Wheeler Company in the manufacture of condensers, evaporators, heat exchangers, pumps, and auxiliaries, and Power Specialty in the manufacture of steam generating equipment (superheaters, economizers and boilers).

The two companies combined in 1927 to form the Foster Wheeler Corporation. Pioneering in these phases of power plant work, the combination afforded a wealth of experience in the design, engineering and fabrication of heavy equipment. This fabrication is performed in the Carteret, N. J., plant, in the Dansville, N. Y. plant, in the St. Catharines, Ontario and the Egham Surrey (England) factories. The new Mountain Top plant is now added to this chain of factories.

Use P. P. & L. Power

Power for the plant is supplied by two high tension lines from Pennsylvania Power and Light Company. Each line carries 66,000 volts to the plant's sub-station at the west end of the main building. Two 2,500 volt transformers will step this voltage down to 4,160 volts before distributing the power to four power centers within the plants. The electric system has been designed with particular attention to safety and future expansion.

Plant Superintendent

Kenneth L. Walker has been appointed superintendent of the new plant. Before being assigned to Mountain Top, Mr. Walker was superintendent of the boiler shop at the Carteret plant of the corporation. He joined the Foster Wheeler organization at this plant during 1934 and specialized in welding and fabrication.

He is married, has one daughter, and resides at Bear Creek.

Milk Output Shows Decline

The seasonal decline in milk production on Pennsylvania farms continued into October when output totaled 454 million pounds or 3 million less than in September, a federal-state survey showed today.

At the same time, a new egg production record for the month of October was set on Keystone State farms as the total for the month zoomed to 309 million.

The State Agriculture Department reported that the October milk flow was one million pounds less than for the same month last year although the number of milk cows on farms was 22,000 higher this October.

Pastures were in very poor condition on Nov. 1 as a result of the prolonged drought. Rain in late October had brought relief and early November snow was beneficial in central and some western counties.

The estimated number of dairy cows in Pennsylvania during October was 928,000 compared with 926,000 during September and 906,000 for October last year.

The October egg production record was set with fewer layers than the Commonwealth had during the same period last year.

Layers in flocks averaged a record 14.2 eggs per bid during October compared with 13.59 in September and 13.52 for October last year, the federal-state survey showed.

Many Lung Cancer Cases Cured by Big X-Ray Doses

NEW YORK — Lung cancer in the advanced stages has responded favorably in a number of cases to a large dosage of X-rays from a 2 million-volt machine, it was reported recently to the American Cancer Society.

Clinical disappearance of the primary cancer mass has occurred in more than half of the cases, according to the report. Five out of 23 lung cancer patients given up as hopeless are alive and without any detectable evidence of the disease 12 to 33 months after completion of the therapy. The 18 others survived for an average period of 16½ months, regarded as high in such cases.

The report was presented at the society's annual meeting at the Commodore Hotel by Dr. Hugh F. Hare, radiologist formerly at the Lahey Clinic in Boston, where the work was carried out in collaboration with Dr. John Trump, physicist of the Massachusetts Institute of Technology, Cambridge. Dr. Hare is now at the Los Angeles Tumor Institute.

The therapy consisted of giving a total of 6,000 roentgen units from a Van de Graaff apparatus over a period of 35 treatment days. The dosage, about twice as high as the standard from conventional X-ray machines, was worked out by Dr. Hare and Dr. Trump on plastic models of the human torso with materials of a density similar to that of the human body.

In this manner the scientists determined the exact amount of radiation that would reach each organ. By planting sensitive X-ray films at various levels in the models they also determined the depth to which any amount of radiation would penetrate the body tissues.

They found that high voltages cause less damage to the skin and scatter over a smaller area than less powerful X rays. They also worked out a technique that made possible the delivery of a single exposure of the two million-volt beam over an area as small as the point of a pencil or as large as the area from the neck to the abdomen.

The radiations were administered to the primary tumor as well as to adjacent lymphatic regions to which the original tumor spreads.

"To the best of our knowledge," Dr. Hare reported, "none of the patients so treated have died as a result of their primary lesion; regression of the tumor has been consistent, and clinical disappearance of the primary growth has occurred in more than half of the cases in this series."

The treatment was started in 1949 on 63 victims of hopeless lung cancer. Their original tumors had spread to other parts of the body and hence were beyond the help of surgery. Of the original number, 21 were so far advanced that they died before the treatment could be completed. Of the remaining 42, 19 had received other X-ray therapy and were therefore not included in the report.

Lung Shadow Stressed

Dr. Richard H. Overholt director of the Thoracic Clinic, Brookline, Mass., said in a report that "the time schedule of treatment for lung cancer can be set ahead many months, even years, by paying immediate attention to the first clue of its presence—the abnormal shadow in the X-ray film."

"An abnormal shadow on a chest film represents the first clue to pulmonary cancer," he said. "This discovery may antedate the appearance of symptoms by months or even years. Negative bronchoscopic or secretion examination does not rule out an early cancer.

"Immediate surgical exploration and total biopsy is the most direct, reliable and safest method of establishing the diagnosis and providing curative treatment. Cancer of the lung is the most detectable of any internal cancer during the silent and early stage. Salvage rate should be high if there is a direct approach to the substance that produces the shadow . . . There should be no procrastination while the shadow of a pulmonary abnormality remains unexplained."

Atomic Fusion To Make New 'Heavy Elements'

BURLINGTON, Mass. (AP)—Research scientists are using atomic fusion to develop special components for power cells in satellites and artifical hearts.

High Voltage Engineering Corp. has announced a $5.2 million research program, using atomic fusion to develop elements with atomic numbers higher than 92. Uranium—with an atomic number of 92—is the heaviest element which occurs naturally on earth.

Dr. Denis M. Robinson, the corporation president, said Wednesday the firm will invest $4.2 million in the project and the remaining $1 million will come from government or private agencies.

American scientists have already created 11 elements, called transuranium, with atomic numbers higher than 92. A 12th element was created recently by Russian scientists using a cyclotron at the Joint Institute of Nuclear Research at Dubna, near Moscow.

Robinson said the search for transuranium elements "has had the greatest payoff of any research of the frontiers of knowledge, including major contributions to the nuclear reactor and the development of power cells for satellites and artifical hearts."

High Voltage will build a new accelerator, the 16 MV Tandem Van de Graaff particle accelerator, which with other existing equipment will produce "energies never before attainable," Robinson said.

He said the accelerator system will be completed by 1970 and will be "at least two and more probably four years ahead of any comparable facility in the western world."

Groups at Massachusetts Institute of Technology, Yale University, and University at California at Berkeley, Argonne National Laboratory, Oak Ridge National Laboratory and the University of Rochester have made studies on the methods of producing the super-heavy elements.

Son John Gordon Trump

See https://www.legacy.com/obituaries/bostonglobe/obituary.aspx?n=john-gordon-trump&pid=160130064

TRUMP, John Gordon 73 years young, went home to the Lord, September 25, 2012, surrounded by family at home in Winchester, Massachusetts, after a nineteen year battle with cancer. Born November 10, 1938, in Boston, Massachusetts, to John George Trump and Elora Gordon Sauerbrun, he graduated from Winchester High School, Bowdoin College, and MIT. In 1969 he married Gisela Steinmann. As a self-employed contractor he enjoyed engineering new ideas for the many homes he renovated or built from the ground up. John was an avid hiker, biker, rock climber, swimmer, windsurfer, musician, dancer, gardener, and lover of life. Mr. Trump is survived by his wife of forty-three years, Gisela Trump, and two children, Thomas John Trump and Sylvia Trump Sexton; one grandson; two sisters, Christine Philp and Karen Ingraham; as well as many nieces, nephews, great nieces, great nephews, other relatives, and friends. He was preceded in death by his parents, his grandparents, mother-in-law, Hedwig Steinmann, and his beloved Labrador, Lucy.

2018 - A profile of John Trump, Donald's oft-mentioned scientist uncle

2018-10-18-physics-today-org-a-profile-of-john-trump.pdf

https://physicstoday.scitation.org/do/10.1063/PT.6.4.20181019a/full/

The president's uncle was an MIT physicist and engineer who made his mark in the development of high-voltage generators, World War II radar, and cancer therapies.

Editor's note: This is an updated version of an article that was published during the 2016 presidential campaign.

President Trump doesn't talk much about science. But when he does, there is an excellent chance he will bring up his late uncle John.

Asked about climate change in a 16 October 2018 interview, Trump said the climate is warming but is apt to cool down again in the future. Confronted with the contrary opinion of scientists, Trump replied that scientists disagree about the issue. Pointing out that his uncle John was "a great professor at MIT for many years," he assured his interviewer, "I have a natural instinct for science."

During his run for the presidency, Trump invoked his uncle as evidence of his genetic predisposition for intelligence. He has also said that conversations with his uncle made him appreciate the complex politics of nuclear weapons.

Princeton University physicist William Happer, a senior staff member with the National Security Council, told E&E News that when he was being considered to direct the White House Office of Science and Technology Policy, Trump spoke to him about his uncle's work on Van de Graaff generators. "That really floored me," recalled Happer, who knew Trump's uncle.

Who was this uncle to whom the world of science is so inextricably tied in the president's mind?

John George Trump was born in New York City in 1907. He was the younger brother of Donald's father, Fred, who went into real estate before he finished high school. With financial assistance from his older brother, John enrolled in the Polytechnic Institution of Brooklyn, intending to become an architect and go into business with Fred. However, he switched to electrical engineering and earned his bachelor's degree in 1929. He went on to Columbia University and received a master's degree in physics in 1931.

John Trump then left New York for MIT and earned his doctorate in electrical engineering in 1933, working under physicist Robert J. Van de Graaff (see *Physics Today*, February 1967, page 49). Trump continued on at MIT as a research associate before receiving an appointment there as an assistant professor of electrical engineering in 1936.

During the 1930s Trump built an enduring partnership with Van de Graaff developing high-voltage electrostatic generators. In 1933 Van de Graaff completed a spectacular 12-meter-high generator that was capable of producing a potential difference of 5 million V and had to be housed in an airship hangar about 100 km south of Boston. Trump later contributed to the redesign of the generator when it was relocated to the Theater of Electricity at Boston's Museum of Science, where it is still demonstrated. Trump became a life trustee of the museum.

Van de Graaff originally designed his generator to be a particle accelerator, but he and his collaborators quickly found applications in high-voltage x-ray generation as well. In 1937 a 1 MV x-ray generator was installed at Huntington Memorial Hospital in Boston, where it supplemented radium in cancer therapies. Medical applications of high-voltage radiation ultimately became a major focus of Trump's work. Circa 1960 he was one of the pioneers of rotational radiation therapy, which limits the dose delivered to healthy tissue. (You can watch him describe his work in a video at MIT's Infinite History website.)

In 1939 Trump and Boston Navy Yard engineer Carlton Lutts found that the Huntington Memorial generator could also produce a radiographic image of thick steel in 100 seconds, whereas using radium it took about 65 hours. That capability would soon substantially improve manufacturers' ability to inspect for defects, and it played an important role in US shipbuilding and aircraft construction during World War II.

Trump concentrated his own wartime work on the new technology of radar. In 1940 a technical mission from the UK introduced US researchers to the cavity magnetron, which enabled radar to operate using centimeter wavelengths, greatly expanding its efficacy and range of applications (see *Physics Today*, July 1985, page 60). The new National Defense Research Committee (NDRC) established a microwave committee, which initiated a radar research and development program at MIT. Trump was among the first to join. The effort soon grew into the MIT Radiation Laboratory, or "Rad Lab," which by 1945 was employing some 4000 people.

Trump became the secretary of the microwave committee in 1942 after its first secretary, MIT electrical engineer Edward Bowles, left to advise the secretary of war on radar implementation. Trump also spent the first part of the war as a liaison from NDRC to the Rad Lab and served as an adviser and assistant to MIT president Karl Compton. In 1943, after the enigmatic Nikola Tesla's death, the Federal Bureau of Investigation asked Trump to examine Tesla's papers to determine whether he had been working on anything that might have relevance to the war. Trump found he had not.

Meanwhile, shortly after the attack on Pearl Harbor, the Rad Lab had begun receiving requests for prototype radar units to be sent directly to the field before the equipment could be thoroughly tested and standardized. Developing equipment on such a "crash" basis soon became routine. Researchers and engineers started to accompany units to the field to glean performance data under combat conditions. During that work, they also troubleshot new equipment and helped develop methods for integrating it into operations.

Initially, much of that fieldwork was done by "operations research" groups and teams of expert consultants working for Bowles. However, in 1943 the Rad Lab established a British Branch (BBRL), which created a direct channel between the lab and the European Theater. Trump became the head of BBRL in February 1944. By November he had begun shuttling back and forth between Great Britain and forward military positions on the continent, serving a dual role with BBRL and with Bowles's contingent working for the US Army Air Forces in Europe.

By mid-April 1945, Trump was in Germany, interviewing enemy radar engineers. Those encounters gave Trump the opportunity to compare the US and UK radar effort with that of the Germans. He was impressed by the differences in organization. As he recorded in his war diary, "Just as there was a gap between German scientists and industrialists, there was also an even greater gap between both of these and the military. It was virtually impossible for a scientist or engineer to accompany radar equipment into combat areas to observe its performance or to assist in training."

engineer to accompany radar equipment into combat areas to observe its performance or to assist in training.

After the war Trump became the director of MIT's High-Voltage Research Laboratory, a position he held from 1946 until his retirement in 1980. In 1946 Trump cofounded the High Voltage Engineering Corporation (HVE) with Van de Graaff and British electrical engineer Denis Robinson, who had been a liaison to the Rad Lab during the war. Trump became the company's chairman and technical director, and he took an active role in developing its accelerator business and several subsidiary companies. Trump was awarded the National Medal of Science in 1983 for his lifetime of path-breaking work.

A unifying theme of Trump's career was his facility in moving back and forth between research and the search for practical applications. In his obituary of Trump (see *Physics Today*, September 1985, page 90), Robinson recalled that his business partner had "an obstinate optimism that could fly in the face of all results and facts available to him and his coworkers."

That was not the same drive animating Trump's by-then-famous nephew's pursuit of real estate glory. Describing John Trump's personality, Robinson wrote, "He was remarkably even-tempered, with kindness and consideration to all, never threatening or arrogant in manner, even when under high stress. He was outwardly and in appearance the mildest of men, with a convincing persuasiveness, carefully marshalling all his facts."

Those characteristics ultimately made John Trump more of a scientist and engineer than a businessman. According to Robinson, "He cared very little for money and the trappings of money." But without mentioning Trump's family relations, Robinson slipped in as an aside that "he did understand land." The property Trump persuaded HVE to purchase in Burlington, on Boston's famed technology corridor, Route 128—"turned out to be worth as much as many years of the company's profitable output."

William Thomas is a science policy analyst for FYI at the American Institute of Physics, which also publishes Physics Today. *The portions of this piece relating to World War II derive from the author's book,* Rational Action: The Sciences of Policy in Britain and America, 1940–1960, *published last year by MIT Press.*

obituaries

John George Trump

John G. Trump, professor emeritus of the Massachusetts Institute of Technology, died on 21 February 1985. He was born in New York in 1907 and received his DSc in electrical engineering from MIT in 1933. He then worked at MIT as a research associate until 1936, when he was made an assistant professor of electrical engineering. In 1952 he became a full professor.

Trump served as director of MIT's High-Voltage Research Laboratory from 1946–80. The unifying basis of his professional life was to maintain the highest reliable dc voltage per centimeter, both in vacuum and in gas pressure, for accelerator applications that he clearly foresaw both in medicine and in industry.

His first goal was a 2-million-volt pressurized x-ray generator that could be flexibly mounted in a hospital treatment room. With this he pioneered at MIT, in close cooperation with the Lahey Clinic physicians, the now widely used rotation therapy for cancer tumors with selective protection of adjacent healthy tissue. He designed many of the setups himself and gave daily supervision of patient treatments with the physicians. He developed modified accelerators for treating skin cancers with electrons. Concurrently, Trump taught special courses for hospital physicists in the Northeast.

Trump's war service orginated as technical aide to Karl Compton at MIT. He was on the Steering Committee of the Radiation Laboratory at MIT, and from 1944–45, director of the British Branch Radiation Lab at Great Malvern, following the American forces into Europe to assist in the best utilization of the centimeter radar and radio countermeasures they were using.

In 1946, Trump, Robert Van de Graaff and I founded the High Voltage Engineering Corporation to manufacture the compact Van de Graaff accelerators he was continuing to develop at MIT. He became the company's chairman and technical director and was intimately involved with Van de Graaff and many of their former students in

TRUMP

the positive-ion and tandem Van de Graaff accelerators designed and manufactured by HVE.

In 1962 he caused Electronized Chemicals Corporation to be reactivated as a subsidiary of HVE to make available in industry high-energy electrons, which he called "the beneficent particles of nature." Trump designed ECC's new facilities and remained active as its chairman until it merged with HVE. In 1974 he began at MIT a six-year study, under a National Science Foundation contract, of the economic feasibility of disinfecting liquid municipal sludge with energized electrons. He led a consortium of institutions and agencies in this endeavor and was actively pursuing this during the last year of his life.

An architecturally imposing reminder of Trump's work can be seen at Boston's Museum of Science in the Theater of Electricity, where he was largely responsible for the handsome electrostatic shielding of the 2-million-volt air-insulated generator, which was originally made by Van de Graaff himself in 1935. Trump was a life trustee of the museum. He took a great interest in the very short pulses of electricity generated by the Ion Physics Corporation, another subsidiary of HVE, and this later developed into pulse precipitation of stack gases, which may become of real importance in the problem of acid rain.

In 1984 he was chosen by the President's Committee on the National Medal of Science, and this medal was posthumously presented, in honor of his work, at the White House in March 1985.

Trump's remarkable personality mix contributed to all of this achievement and success. He was remarkably even-tempered, with kindness and consideration to all, never threatening or arrogant in manner, even when under high stress. He was outwardly and in appearance the mildest of men, with a convincing persuasiveness, carefully

marshalling all his facts. Yet over and over, there was an obstinate optimisim that could fly in the face of all results and facts available to him and his coworkers. He cared very little for money and the trappings of money, but he did understand land; the land that he persuaded HVE to purchase in Burlington turned out to be worth as much as many years of the company's profitable output.

Trump's over 100 jointly and singly published papers and reports have brought to three generations of engineers and technicians his clear understanding of the geometry and arithmetic of radiation dosage, whether for x-ray therapy, for radiography, for disinfection and pasteurization or for molecular engineering—the conversion of one form of molecular structure into another. Much of this work stemmed from his own pioneer laboratory work with models.

High Voltage Engineering Corporation

William L. McMillan

The death of William L. McMillan, professor of physics at the University of Illinois, Urbana–Champaign, on 30 August 1984, brought to an abrupt end a distinguished career in condensed-matter physics. Born 13 January 1936 in Little Rock, Arkansas, he died at age 48 at the peak of his productivity. In his last year McMillan had more than a dozen papers published or in the process of publication.

In 1964 McMillan received a doctorate in physics from the University of Illinois; his thesis on the ground state of liquid helium marked the first application of Monte Carlo methods to a quantum system. Using a variational technique, he calculated the energy, density, pair correlation function and condensate fraction in the zero-momentum state, obtaining results in remarkably good agreement with calculations done later by others with more powerful computers.

In late 1963, McMillan joined the theoretical physics research department at Bell Laboratories, where he worked on a variety of problems in superconductivity, liquid helium and liquid crystals. One of his earliest accomplishments was a computer calculation for deducing the electron–phonon interaction spectrum directly from the tunneling data of an experimental colleague, John Rowell, for which they were jointly awarded the Fritz London Prize. McMillan continued to work on the problem of strong coupling superconductors, which led to the widely used "McMillan T_c formula" and the "McMillan high-T_c limit" for superconductivity as trade-offs

McMILLAN

between strong coupling and phonon softening. While on leave at Cambridge University (1967–68), he wrote his classic paper on the proximity effect and reinvented a formalism for strongly coupled quantum fluids.

Around 1970, McMillan made the first of a number of dramatic plunges into an entirely new field: As a result of visits to Orsay, he became involved with liquid crystals, with their rich variety of phases. On returning to Bell Labs, he was so enthused with the idea of studying liquid crystals with x rays that he shifted from the theory department and set up his own laboratory. Before long, McMillan's experimental work spanned the entire gamut from chemical characterization (synthesis, chromatography) to state-of-the-art measurements on borrowed apparatus. He made pioneering x-ray studies of the critical fluctuations of the order parameter and the corresponding divergence of the transverse and longitudinal coherence lengths associated with the nematic to smectic-A and smectic-C phase transitions.

In 1972, McMillan returned to Urbana to join the staff of the physics department, where he remained until his death, except for a sabbatical year (1977–78) spent at Orsay. At Illinois, he continued to work for several years on both theoretical and experimental aspects of liquid crystals with his graduate students, expanding his experimental repertoire to include light scattering and heat capacity measurements. At the same time, he became deeply interested in the phenomenon of charge-density waves and electronically driven structural phase transitions, and their interaction with superconductivity in transition-metal dichalocogenides and the high-T_c A-15 compounds. This led to a series of papers on phenomenological Landau mean-field theories, both static and dynamic, which he later modified to include fluctuations. In doing so, he unearthed the relevance of domain walls (which he dubbed "discommensurations") in phases with incommensurate charge density waves.

McMillan's own experimental program made him both sensitive to and discerning of the significance of experimental results of other workers. In 1979, on seeing raw experimental data indicating the breakdown of Mott's model of minimum metallic conductivity, he proceeded to develop his own theory of electron localization in disordered metals. A year later, after realizing the importance of Coulomb interactions, he returned to the lab. As was his custom, he assembled his own apparatus and carried out tunneling measurements near the metal–insulator transition. On the basis of his experimental results McMillan constructed a new theory of the metal–insulator transition that included both electron localization and Coulomb interactions on an equal footing. He realized that disordered interacting electronic systems should be controlled by nontrivial fixed points to explain the tunneling data. This opened up the possibility of classifying their universality classes.

In 1981, McMillan turned to a long-planned project that fully engaged his experimental and theoretical skills. Using state-of-the-art arithmetic chips and a processor to control its microcode, he built a high-speed computer in his basement, explicitly for Monte Carlo calculations. It would run for days and even weeks, surviving both power failures and a flood.

During the last few years, McMillan worked on several of the outstanding problems of statistical mechanics, using sophisticated, modern, numerically based methods. He developed and exploited a variant of finite-size scaling, which he called the "macroscopic renormalization group."

McMillan is remembered not only as a great mind but also as a friend. Many of his friends at Murray Hill and Urbana have contributed to this account of his professional career; many more could.

John George Trump

1907–1985

By Louis Smullin

John George Trump, a pioneer in the scientific, engineering, and medical applications of high voltage machinery, died on February 21, 1985. Married to the late Elora Trump, John left three children: John, Karen, and Christine.

At the time of his death, John Trump was professor emeritus at the Massachusetts Institute of Technology (MIT) in the Department of Electrical Engineering. He was also senior consultant for the High Voltage Engineering Corporation, the company he founded in 1946 and where, until 1970, he served as chairman of the board and then, until 1980, as technical director.

John Trump was born in New York City on August 21, 1907. He earned a B.S. in electrical engineering from the Polytechnic Institute of Brooklyn in 1929 and an M.S. in physics from Columbia University in 1931. In 1933 he received a D.Sc. in electrical engineering from MIT, where he became a research associate in that same year, an assistant professor in 1936, and a professor in 1952. Trump formally retired in 1973, although he continued his active research program as professor emeritus until 1980.

John Trump came to MIT to work with Professor Robert J. Van de Graaff in what was then the new field of super-high voltage generation and applications. "Van's" main interest was in the application of his new electrostatic generator in the field of nuclear physics. John Trump had two main interests: the insulation of super-high voltages in vacuum and compressed gases and the biological applications of high voltage radiation. These wide-ranging biological applications included the treatment of cancer by megavolt (Mev) X-radiation and electron beams, extensive pioneering studies of food preservation by electron beams, and the treatment of sewage and sludge by 2-Mev electron beams.

With grants from the Godfrey M. Hyams Fund, Trump and his young assistants designed and built an air-insulated megavolt generator that was installed at the Huntington Memorial Hospital in 1937. It was large and awe inspiring. On wet days, the generator crackled and sparked or just died, but the conspicuous advantages of its megavolt X-ray therapy soon became clear. The greater penetration depth of these radiations, compared to lower energy X-rays, permitted more deeply seated tumors to be treated with minimal damage to adjoining tissues.

In 1938, with continued funding from the Hyams Fund, the team began the design of a new, compact 1.25-Mev generator that would be insulated with compressed gas. This particular machine was installed in the George Robert White Hospital of the Massachusetts General Hospital, where it remained in active use for sixteen years. **Trump then undertook the building of a 1.75-Mev machine for the American Oncological Hospital of Philadelphia—until World War II intervened, that is, and the machine was taken by the U.S. Army for use in the Manhattan Project**.

During World War II, Trump interrupted his high-voltage career to work on microwave radar in the MIT Radiation Lab. He served for a time as field services director and was then posted to the British branch of the Radiation Lab. **In 1944 he was named director of the lab and given the responsibility of working directly with the Eisenhower Military Command**. **At the liberation of Paris, Trump rode into the city with General Eisenhower and immediately began to set up the Paris branch of the Radiation Lab.**

His diary of this period is fascinating reading, especially for those of us who remember the significance of H2X, Oboe, Loran, MEW, SCR 584, and other sets of initials from the alphabet soup of the day. For his wartime service, John Trump received a Presidential Citation and the King's Medal for Service in the Cause of Freedom.

After the closing of the Radiation Lab in 1946, Dr. Trump quickly picked up the threads of his previous high-voltage research. He formed the High Voltage Engineering Company to put electrostatic high voltage machines to work. Van de Graaff generators were soon in use all over the world with a wide range of applications, including those in physics research, the sterilization of surgical instruments, the cross-linking of polymers, and the radiography of welds and castings.

Trump's main efforts and interests, however, remained on the MIT campus, where he initiated a long series of experiments, supported by the Natick Laboratory of the Army Quartermaster Corps, in the preservation of food by high voltage radiation. There was also a continuing train of experiments on the bactericidal and viricidal effectiveness of high voltage radiation. Much new work as done on compressed gas insulation, but his most noteworthy contributions were in the treatment of cancer by radiation.

Dr. Trump and his staff began a systematic study of the problems of delivering radiation to deep tumors without destroying the intervening healthy tissue. From their research came an improved technique of rotating the patient 360 degrees about the tumor site, so that the radiation beam entered the body from all directions but focused on the tumor. The team also developed techniques for static and dynamic beam shaping to protect healthy tissues. This work led to a cooperative twenty-five-year research venture with the Lahey Clinic: the setting up of a treatment facility in the MIT High Voltage Lab, where patients were routinely treated under the joint supervision of Trump, his staff, and the Lahey Clinic physicians. Ultimately, more than ten thousand patients were treated.

Until 1950 nearly all high-voltage radiation therapy was done with X-rays generated by the impact of a high-voltage electron beam against a gold target inside a vacuum. In a 1940 paper, Trump, Van de Graaff, and Cloud had suggested using direct high-voltage electrons because of the uniquely different way they penetrated matter.

Although X-rays are absorbed more or less uniformly as they traverse the body from the skin inward, high-energy electrons produce very little ionization until their energy falls below a critical value. They then do all of their ionizing within a very short distance and almost never extend beyond it. The first clinical test of this new technique was made in 1951. The technique offered an ideal way to treat many superficial malignancies, and soon after its initial use, it became a standard method of treatment.

Dr. Trump began his last major effort in 1976. Like all concerned citizens, he was offended by the dumping of millions of gallons of barely treated or raw sewage into our harbors and waterways. His calculations showed that a 2-Mev electron radiation system compared favorably with chlorine treatment on an economic basis, had the additional advantage of destroying many viruses, and appeared to dissociate PCBs and similar compounds into less noxious forms. With National Science Foundation support, Trump and his associates built a pilot plant at the Deer Island Sewage Plant in Boston Harbor. In addition, based on the valuable electron radiation data produced at the Deer Island plant, a commercial sewage treatment plant has been built for the greater Miami area.

John Trump was truly a pioneer in the field of high voltage engineering and high voltage machinery and in the medical applications of high energy radiation. He was the author or coauthor of more than one hundred papers and the recipient of many honors from numerous engineering and medical societies. John Trump was elected to the National Academy of Engineering in 1977. The latest award bestowed upon him was the National Medal of Science, which was presented posthumously in February 1985.

His mixture of personal technical work and quiet leadership produced many important discoveries. John Trump will be missed by his worldwide circle of colleagues and friends.

1998 interview of Mortimer Elkind

National Cancer Institute Oral History Project

Interview with Mortimer Elkind

Conducted on July 30, 1998, by Gretchen A. Casein

Conducted at Dr. Elkind's office at Colorado State University

- GC:
  - This is Gretchen Case, talking to Dr. Mortimer Elkind. We are in his office in FortCollins, Colorado, at Colorado State University. Today is July 30, 1998, and it is about3:00 p.m. I usually just like to start by asking about your background and about how you came to the National Cancer Institute.
- ME:
  - I have a peculiar background. My original training was in engineering. I was a mechanical engineer, a graduate of the Cooper Union School of Engineering. Shortly after that I had a job working as an engineer and then I was drafted into the Navy. I got out of the service and I had the GI Bill of Rights.
  - I started working as an engineer for the Sloan Kettering Institute for Cancer Research, which was a research arm of the Memorial Cancer Hospital in New York City. While I was there, I was recruited by a person from the NCI in Bethesda. I'll think of his name after a while. In any event, he sent me to MIT to study a particle accelerator that hew anted to get for the National Cancer Institute. I was working in the laboratory where the particle accelerator had been developed, the laboratory of John Trump.
  - While I was there, I decided with my GI Bill of Rights to go to school and I did do just that. So I went to school. At that point, the person whose name I didn't remember is Egon Lorenz, L-o-r-e-n-z. He was a biophysicist in charge of various things connected with radiation at the National Cancer Institute. He recruited me while I was at SloanKettering Institute and at that point I already had one master's degree in mechanical engineering from the Brooklyn Polytechnical Institute. Well, part of the idea that he had was to send me off to John Trump's laboratory to learn about the care and feeding of a particle accelerator called the Van de Graaf accelerator, V-a-n d-e G-r-a-a-f, which I did.
  - While I was there I decided to apply my school credits and go to school while a guest at the Massachusetts Institute of Technology. I obtained another master's degree while I was there, in physics, and went on to do a Ph.D. in physics. I didn't do any biology whileI was there. By the time I finished, which was after a four-year period, Dr. Lorenz suggested that I might want some postdoctoral work, which I thought was a good idea. He gave me a choice of doing physics or doing biology. I chose biology and went out toBerkeley, where I became a postdoc fellow in Tobias's laboratory, Cornelius Tobias's laboratory, at the Donner Lab at the University of California at Berkeley
- **GC:**
  - That was Cornelius Tobias?
- **ME:**
  - Tobias. T-o-b-i-a-s. I was out there about nine or ten months, when I was called back to the East Coast because Lorenz had died in the interim. He had a rather weak heart. Dr. Burroughs Mider, who was the scientific director, wanted me to get things going in Bethesda. Very nicely, he allowed me to set up my own laboratory with my own technician, Harriet Sutton. He invited me to do whatever I was interested in. So I started working in biology and worked on yeast biology, actually yeast radiobiology. That was in 1954.
  - A few years later, Ted Puck, here in Denver, introduced quantitative procedures for working with mammalian cells in culture. I thought that was a great idea to start working on the radiobiology of mammalian cells. So I came out to Puck's laboratory for about a week and had a course that a number of people attended and I was one of them. I think I was here a week and a weekend up in the mountains. I went home and converted my laboratory from yeast to mammalian cells, with the encouragement of Bo Mider, who was the Scientific Director at the NCI

Trusted Information Systems, Inc.

Type

Public (Former Nasdaq symbol:TISX)

Industry

Computer software

Computer security

Fate Acquired by McAfee, later by SPARTA, Inc., which was acquired by Cobham, plc

Successor McAfee

Founded 1983

Founder Stephen T. Walker

Headquarters Glenwood, Maryland, U.S.

Area served Worldwide

Products

Firewall Software, IPSec VPN, Trusted OS

Trusted Information Systems (**TIS**) was a computer security research and development company during the 1980s and 1990s, performing computer and communications (information) security research for organizations such as NSA, DARPA, ARL, AFRL, SPAWAR, and others.

History

TIS was founded in 1983 by NSA veteran Steve Walker, and at various times employed notable information security experts including David Elliott Bell, Martha Branstad, John Pescatore, Marv Schaefer, Steve Crocker, Marcus Ranum, Wei Xu, John Williams, Steve Lipner and Carl Ellison. TIS was headquartered in Glenwood, Maryland, in a rural location. The company was started in Walker's basement on Shady Lane in Glenwood, MD. As the company grew, rather than move to Baltimore or the Washington D.C. suburbs, a small office building was constructed on land next to Walker's new home on Route 97.

Products

TIS projects included as the following:

1. Trusted Xenix, the first commercially available B2 operating system;
2. Trusted Mach, a research project that influenced DTOS and eventually SELinux;
3. Domain and Type Enforcement (DTE) which likewise influenced SELinux;
4. FWTK Firewall Toolkit (the first open source firewall software) in 1993;
5. First whitehouse.gov e-mail server was hosted at TIS headquarters from June 1 of 1993 to January 20 of 1995;
6. Gauntlet Firewall in 1994, one of the first commercial firewall products, with broad range of Internet Standards, including S/MIME, SNMP, DNS, DNSSEC, and many others. This Firewall became the inception of the third generation firewall;
7. IP Security (IPSec) product in late 1994, known as the first IPSec VPN commercial product in IT history;
8. Encryption Recovery technology integrated with IPSEC, ISAKMP, IKE, and RSA.

TIS's operating system work directly affected BSD/OS, which the Gauntlet Firewall and IPSec was based on, as well as Linux, FreeBSD, HP UX, Sun OS, Darwin, and others.

Post company

The company went public in 1996 and soon afterwards attempted to acquire PGP Inc.; it was instead acquired in 1998 by Network Associates (NAI), which later became McAfee, who had already bought PGP Inc. in 1997. The security research organization became NAI Labs and the Gauntlet engineering and development organization was folded into Network Associates' engineering and development.

NAI Labs went through a couple of branding changes which complemented Network Associates' branding efforts. In 2001 the name was changed to Network Associates Laboratories to better match the corporate identity. Then, in 2002-2003, there was a major branding initiative by Network Associates culminating in selection of the flag brand, McAfee. As a result, the security research organization became McAfee Research.

In 2003, SPARTA, Inc., an employee-owned company, acquired the Network Security branch of McAfee Research.

In 2005, SPARTA acquired the remaining branches of McAfee Research, which were organized into the Security Research Division (SRD) of the Information Systems Security Operation (ISSO).

In 2008, Cobham, plc, a British aerospace company, acquired SPARTA. There have been no organizational changes to SRD or ISSO that affect the security research.

On a separate path, TIS's primary commercial product, the Gauntlet Firewall, was acquired in 1999 from McAfee by Secure Computing Corporation (SCC), that used to be one of TIS's major competitors, because at the time McAfee wasn't interested in being a firewall vendor. The code base was integrated with Secure Computing's firewall product and branded Sidewinder Firewall, which then returned to McAfee when Secure Computing was acquired by them in 2008, and re-branded McAfee Enterprise Firewall. The end of this product line came in 2013, following McAfee's acquisition of another major firewall vendor, Finland-based Stonesoft. McAfee announced in October 2013 the intention to migrate their existing installed base of firewalls to Stonesoft's own Stonegate.

TRW Inc., was an American corporation involved in a variety of businesses, mainly aerospace, automotive, and credit reporting.[2] It was a pioneer in multiple fields including electronic components, integrated circuits, computers, software and systems engineering. TRW built many spacecraft, including Pioneer 1, Pioneer 10, and several space-based observatories. It was #57 on the 1986 Fortune 500 list,[3] and had 122,258 employees.[1] The company was called **Thompson Ramo Wooldridge Inc.**, after the 1958 merger of the Ramo-Wooldridge Corporation and Thompson Products. This was later shortened to TRW.

The company was founded in 1901 and lasted for just over a century until being acquired by Northrop Grumman in 2002. It spawned a variety of corporations, including Pacific Semiconductors, The Aerospace Corporation, Bunker-Ramo and Experian. Its automotive businesses were sold off by Northrop Grumman as TRW Automotive, which is now part of ZF Friedrichshafen. TRW veterans were instrumental in the founding of corporations like SpaceX.[4][5]

In 1953, the company was recruited to lead the development of the United States' first ICBM.[6][7] Starting with the initial design by Convair, the multi-corporate team launched Atlas in 1957.[8] It flew its full range in 1958 and was then adapted to fly the Mercury astronauts into orbit.[8] TRW also led development of the Titan missile,[6] which was later adapted to fly the Gemini missions. The company served the US Air Force as systems engineers on all subsequent ICBM development efforts[9] but TRW never produced any missile hardware because of the conflict of interest.[10] In 1960, Congress spurred the formation of the non-profit Aerospace Corporation to provide systems engineering support to the US government[6] but TRW continued to guide the ICBM efforts.

[...]

History

TRW originated in 1901 with the **Cleveland Cap Screw Company**, founded by David Kurtz and four other Cleveland residents.[11] Their initial products were bolts with heads electrically welded to the shafts. In 1904, a welder named Charles E. Thompson adapted their process to making automobile engine valves[11] and by 1915, the company was the largest valve producer in the United States.[12] Charles Thompson was named general manager of the company, which became **Thompson Products** in 1926.[13] Their experimental hollow sodium-cooled valves aided Charles Lindbergh's solo flight across the Atlantic.[12]

In 1937, Thompson Motor Products bought J.A. Drake and Sons (JADSON).[*citation needed*] The company made high-performance valves that were used in many racing engines of the day, including the Miller Offy.[*citation needed*] Dale Drake (son of J.A. Drake) bought the Offy engine design with his partner Louis Meyer in 1946 and won the Indianapolis 500 twenty-seven times, more than any other engine design.

During the period leading up to World War II, through the end of the Korean war, Thompson Products was a key manufacturer of component parts for aircraft engines, including aircraft valves. The TAPCO plant, owned by the US government but operated by Thompson Products, extended for almost a mile along Cleveland's Euclid Avenue. It employed over 16,000 workers at the peak of WW II production. As jet aircraft replaced piston-engined aircraft, Thompson Products became a major manufacturer of turbine blades for jet engines

In 1950, Simon Ramo and Dean Wooldridge while working for Hughes Aircraft, led the development of the Falcon radar-guided missile, among other projects. They grew frustrated with Howard Hughes' management, and formed the **Ramo-Wooldridge Corporation** in September 1953,[13] with the financial support of Thompson Products.[2] The detonation of a thermonuclear bomb by the Soviet Union spurred Trevor Gardner to form the Teapot Committee in October 1953. Chaired by John von Neumann, its purpose was to study the development of ballistic missiles, including ICBMs. Ramo and Wooldridge were committee members, and Ramo-Wooldridge Corp. became the lead contractor of the resulting ICBM development effort, reporting to the United States Air Force.

With continued backing from Thompson Products, Ramo-Wooldridge diversified into computers and electronic components, founding Pacific Semiconductors in 1954.[14][15] They also produced scientific spacecraft such as Pioneer 1. Thompson Products and Ramo-Wooldridge merged in October 1958 to form Thompson Ramo Wooldridge Inc., unofficially known as "TRW".[13] In February 1959, Jimmy Doolittle became chairman of the board of **Space Technology Laboratories (STL),** the division which continued to support the Air Force ICBM efforts.[13]

Other aerospace companies believed TRW's Air Force advisory role granted it unfair access to their technologies[14] and in September 1959, Congress issued a report recommending that STL be converted to a non-profit organization. With nearly half of STL's employees,[13] The Aerospace Corporation was formed in June 1960. It headed the Atlas conversion for Mercury, Titan conversion for Gemini, and provided ongoing systems engineering support for the government. The Air Force continued its ICBM work with TRW.[2]

Dean Wooldridge retired in January 1962[13] to become a professor at California Institute of Technology.[2] Simon Ramo became president of the Bunker-Ramo Corporation in January 1964, jointly owned by TRW and Martin Marietta for the production of computers and monitors. Thompson Ramo Wooldridge officially became TRW Inc. in July 1965.[13] Free of anti-competitive restrictions short of ICBM hardware, STL was renamed TRW Systems Group that same month.[13] In 1968, the company entered the credit reporting industry by purchasing Credit Data Corporation and renaming it TRW Information Systems and Services Inc. The Credit Data group was formed in 1970[13] to compete with Dun & Bradstreet,[2] from the combination of TRWISS and ESL[13] to specialize in technical strategic reconnaissance. TRW Information Systems and Services Division (Credit Data) was spun off in 1996 to form Experian.[16] TRW acquired LucasVarity in 1999, then selling Lucas Diesel Systems to Delphi Automotive and Lucas Aerospace (then called TRW Aeronautical Systems) to Goodrich Corporation.[17]

The company was 57th[3] on the Fortune 500 list of highest revenue American companies in 1986 and had 122,258 employees in 2000.[1] It operated in 25 countries.[2]

On February 3, 1986, the TRW plant in Harrisburg, Pennsylvania, burned to the ground in an eight-alarm fire.[18] The damage was estimated to be greater than $10 million and was the most serious fire to date in the area.

In February 2002 Northrop Grumman launched a $5.9-billion hostile bid for TRW. Northrop Grumman, BAE Systems, and General Dynamics contended for the company with Northrop's increased bid of $7.8 billion ultimately being accepted on July 1, 2002. Soon afterward, the automotive assets of LucasVarity and TRW's own automotive group were sold to The Blackstone Group as TRW Automotive.[19]

Much of TRW's Lyndhurst campus is now home to the Cleveland Clinic Wellness Center.[20]

Bill Gates, the founder of Microsoft, says that he got "his first big break" at age fifteen, debugging energy-grid control software for TRW. "It was kind of scary," Gates said, realizing the things the program was going to help operate. "This thing *needs* to work."[21]

Aerospace

TRW Inc. was active in the development of missile systems and spacecraft, notably, the early development of the U.S. ICBM program under the leadership of the Teapot Committee led by John von Neumann. TRW pioneered systems engineering, creating the ubiquitous N^2 chart and the modern functional flow block diagram. It served as the primary source of systems engineering for the United States Air Force ballistic missile programs.[22]

Space exploration

Space Technology Laboratories (STL), then a division of Ramo-Wooldridge Corp., designed and produced the identical payloads for Pioneer 0, 1 and 2. These were intended to orbit and photograph the Moon, but launch vehicle problems prevented this. NASA launched Pioneer 1 as its first spacecraft on October 11, 1958.[23] It set a distance record from Earth, and provided data on the extent of Earth's radiation belts.

Pioneer 10 and 11 were nearly identical spacecraft, designed and fabricated by TRW Systems Group.[24] They were optimized for ruggedness since they were the first man-made objects to pass through the asteroid belt and Jupiter's radiation belt. Simplicity, redundancy, and use of proven components were essential.[25] As NASA's first all-atomic powered spacecraft,[26] these used plutonium-238 units developed by Teledyne Isotopes.[27] Pioneer 10 carried eleven instruments and Pioneer 11 carried twelve for investigating Jupiter and Saturn, respectively.[28] Data was transmitted back to Earth at 8 Watts, 128 bytes/s at Jupiter,[29] and 1 byte/s from further out. Pioneer 10 was the first man-made object to pass the planetary orbits and its last telemetry was received in 2002, thirty years after launch.[30]

TRW Systems Group designed and built the instrument package which performed the Martian biological experiments,[31] searching for life aboard the two Viking Landers launched in 1975. The 34-lb (15.5 kg) system performed four experiments on Martian soil using a gas chromatograph-mass spectrometer (GC-MS) and a combined biological instrument.

Space-based observatories

TRW designed and built the following space observatories:

- HEAO 1, 2, and 3, with HEAO 2 being the Einstein Observatory, the first fully imaging X-ray telescope put into space
- Compton Gamma Ray Observatory which is the second of four among NASA's Great Observatories program
- Chandra X-ray Observatory is the third of NASA's Great Observatories

The teams developing the following observatories continued their work as part of Northrop Grumman Aerospace Systems:

- SIM Lite space telescope which would have searched for Earth-sized planets in the habitable zones around nearby stars (project canceled)
- James Webb Space Telescope[32] which will be the successor to the Hubble Space Telescope

Satellites

TRW Systems Group designed and manufactured the Vela series of nuclear detection satellites which monitored the 1963 establishment of the nuclear Partial Test Ban Treaty.[33] Subsequently, they produced the Advanced Vela series, first launched in 1967, which could detect nuclear air bursts using instruments actually called bhangmeters. It had the first dual-spin attitude control system with the total system momentum controlled to zero.[34] The Vela and Advanced Vela satellites were the first to alert astronomers to the presence of gamma-ray bursts. They also reported a mysterious apparent nuclear test now called the Vela Incident.

First launched in 1970, the company built all twenty-three reconnaissance satellites in the Defense Support Program (DSP), which are the principal components of the Satellite Early Warning System currently used by the United States. These are operated by the Air Force Space Command, and they detect missile or spacecraft launches and nuclear explosions using sensors that detect the infrared emissions from these intense sources of heat. During Desert Storm, for example, DSP satellites were able to detect the launches of Iraqi Scud missiles and provide timely warnings to civilians and military forces in Israel and Saudi Arabia.[35]

The initial seven Tracking and Data Relay Satellites (TDRS) were built by TRW to improve communication coverage for the Space Shuttle, International Space Station, and US military satellites. When first launched in 1983, the TDRS satellites were the largest, most sophisticated communications satellites built at the time.[36] The seventh vehicle in the series was ordered as a replacement when TDRS-2 was lost in the Challenger accident.

Launched in 2002, TRW produced the Aqua spacecraft based on their modular standardized satellite bus.[37] A joint project of the United States, Japan, and Brazil, Aqua delivers 750 Gigabytes per day detailing the Earth's water cycle in the oceans, lakes, atmosphere, polar ice caps, and vegetation.

Rocket engines

TRW designed and built the descent engine or (LMDE) for the Apollo lunar lander. Due to the need for a soft landing on the Moon, it was the first throttleable engine for manned space flight. This, and the requirements for high thrust, low weight, and crushability (in case of landing on a large rock),[15] earned surprising praise from NASA's history pages, considering the complexity of the lunar missions: "The lunar module descent engine probably was the biggest challenge and the most outstanding technical development of Apollo".[38] This engine was used on Apollo 13 to achieve free return trajectory and make a minor course correction after damage to the Service Module.

After the Apollo program moon landings, the LMDE was further developed into the TRW TR-201 engine. This engine was used in the second stage Delta-P of the Delta launch vehicle for 77 launches between 1972–1988.

Semiconductors and computers

The **Ramo-Wooldridge Corp** formed Pacific Semiconductors in June 1954, under the leadership of Harper North who had been head of electronics R+D at Hughes Aircraft. The funding for this endeavor from Thompson Products was about ten times their initial investment in Ramo-Wooldridge.[14][15] The original goal was to produce the recently invented transistor for commercial sales.

In 1957, Howard Sachar and Sanford "Sandy" Barnes invented the Varicap electronic component (also known as the varactor diode) at Pacific Semiconductors.[39] This device reduced the physical size of radio tuners and eliminated the need for moving mechanical parts. This simplified the implementation of remote control TV tuners. Sachar and Barnes were awarded an Emmy in 2007.[40]

The company manufactured the RW-300 for sales in 1959, one of the first "all-transistor" computers[14] with a power supply that used vacuum tubes. The computer was targeted at industrial control applications, with 1024 analog inputs multiplexed to a 1.9K sample/s 10-bit analog-to-digital converter which was transparent to the programmer. It weighed about 600 pounds (270 kg).[41][42] The real-time operating system was written by John Neblett, and was the intellectual precursor of the RSX-11 operating system for the PDP-11.[43]

The TRW-130 computer was introduced in 1961,[44][45] and designated the AN/UYK-1 by the US Navy as part of its pre-GPS TRANSIT (NAVSAT) satellite-based location system. It used Doppler shifts to compute a location in about 15 minutes, and had rounded corners to allow installation in submarines.

The TTL logic gate, which was the electronics industry standard for two decades, was invented by TRW's James L. Buie in 1961.

In 1965, engineers Don Nelson and Dick Pick at TRW developed the Generalized Information Retrieval Language and System, for use by the U.S. Army to control the inventory of Cheyenne helicopter parts. This developed into the Pick Database Management System which is still in use as of 2016.[46]

TRW LSI Products, Inc. was a wholly owned subsidiary formed to commercialize the integrated circuit technology the company had developed in support of its aerospace business. They produced some of the first commercially available digital signal processing ICs including the TDC1008 multiplier-accumulator.[47] They also made the first 8-bit flash ADC IC, the TDC1007,[48] resulting in an Emmy Award for analog/digital video conversion technology.[49] TRW also pioneered gallium arsenide (GaAs) chip applications for local multipoint distribution service (LMDS) systems, radios, and satellite communications.[50]

Music

Bel Canto Stereophonic Recordings, a TRW subsidiary, was a record label active from the mid-1950s to the early 1960s.[28][29]

In the media

Christopher John Boyce was a TRW employee convicted of selling security secrets to the Soviet Union via the Soviet embassy in Mexico City in the mid-1970s. Boyce and his accomplice, Andrew Daulton Lee, were the subjects of the best-selling 1979 Robert Lindsey book *The Falcon and the Snowman*, and the 1985 film of the same title.

Representatives from Space Technology Laboratories present their ICBM expertise to Don and Pete in *Mad Men* season 2 episode "The Jet Set".[51]

The *Star Trek: The Original Series* season 1 episode "Operation: Annihilate!" (April 13, 1967) was filmed on the campus-like TRW grounds in Redondo Beach, California. The two sets of stairs shown are those leading to the Cafeteria of Building S.[52]

The TRW building is supposedly one of the credit company buildings demolished in the 1999 film *Fight Club*. This is because at the time the book was written, TRW was in the business of credit reporting. However, there is no TRW building in Delaware, where the demolition purportedly happens.[53]

1962 - Emigration to the USA

In 1962, Gilbert Leonard Tugwell emigrated to the United States as an employee of **Engelhard Minerals and Chemicals Corporation** [HN0035][GDrive].

1965 - Tugwell has knowledge of using gold for rocket applications

There is a 1971 research paper author in this paper quotes GIlbert L Tugwell from the 1965 source : "G. L. Tugwell, Metal Prog., 1965,88,73;"

From 1971 research paper "The Optical Properties of Gold - A REVIEW OF THEIR TECHNICAL UTILISATION" by Otto Loebich. (to read the PDF see [HC0005][GDrive])

"For heating purposes the costly radiated heat is concentrated to the greatest possible extent. Domestic cookers, for instance, are fitted with high-speed heaters emitting infra-red rays between 750 and 3000nm. They are located at the focus of a gold-coated parabolic metal reflector (thickness of gold deposit approximately 200 nm). An insulating oxide inter-layer prevents the gold from diffusing into the reflector surface (29). Another system employing waves between 5000 and 15000 nm is used to accelerate the drying of paper after printing (29). ***Tugwell*** *discusses a hemispherical Westinghouse annealing dome, where the moulded steel dome of a space capsule is heated to 650°C and fitted over a Thin gold films applied to plate glass windows give adequate transmission of light combined with good reflectivity in the infra-red range, so avoiding uncomfortable overheating of the building during hot weather. The Lurgi headquarters in Frankfurt is one of many office blocks and similar buildings fitted with such gold-coated windows made by Flaehglas A.G. Delog-Detag of Fürth, West Germany former without using an excessive amount of power.The radiation from the heating bars is reflected by the gold-coated interior walls and is focused on to the steel dome."*

"In the final sizing of steel domes for rocket casings a heat-forming operation was devised by Westinghouse in which the casing was accurately expanded over a mandrel at 650° C. Heating was from high temperature quartz lamps, with gold-coated reflectors to concentrate the heat on the mandrel and work-piece and at the same time to prevent heat losses to the wiring and the structure behind the reflectors"

1968 - As VP of Engelhard, comments on US government involvement in pricing of platinum

See full publication : [HP0007][GDrive]

*"Platinum: Engelhard's intimacy with the federal government was recently suggested by Senator John J. Williams (R-Del.) in connection with platinum (New York Times, 3/24/68). The government was prepared to sell 115,000 ounces of stockpiled platinum to Engelhard Minerals and Chemicals Corp. at a price $12 million below the prevailing market price for the metal. In defense, **G. L. Tugwell**, Executive Vice-President of Engelhard, said, "The thing that annoys us is that we have struggled through this to maintain a fair and reasonable price. Then this silly jerk stands up in the Senate and insinuates we're making a windfall." But the Senator bolstered his charge by seeking to amend the platinum disposal bill by setting the price at $216 to $225 an ounce, which is double the current price paid by Eigelhard and Matthey-Bishop, Inc., the only two U.S. refiners of platinum, but which is the price charged in Western Europe."*

The Daily Oklahoman - March 26 1968

See full page : [HN003C][GDrive]

10 Tues., March 26, 1968 THE DAILY OKLAHOMAN

Metal Sale Called Boon to Democrat

New York Times Service

NEW YORK — While much of the world wonders about gold, Sen. John J. Williams (R. Del.) is concerned with platinum.

The senator is seeking to bring about release of 115,000 ounces of platinum from the government's stockpiles.

He charges the government proposes to sell this platinum at a price $12 million below the prevailing market price for the metal.

He says an amendment he has offered to the disposal bill would rectify this by setting the price at $216 to $225 an ounce.

Unless such a price is set, Williams argues, a windfall Russia, South Africa and Canada are virtually the only sources of platinum.

Withdrawal by the Soviet Union created a speculative market in trading of futures in platinum and drove up the price of Soviet metal, offered selectively in Western Europe, to $216 to $225 an ounce.

But the United States refiners, Engelhard and Matthey-Bishop, adopted a "producer price," currently at $109 to $114 an ounce, depending on the size of an order.

"The thing that annoys us," Tugwell of Engelhard

profit will accrue to the Engelhard Minerals and Chemicals Corp. largely owned by Charles W. Engelhard, a friend of President Johnson and a large contributor to the Democratic Party.

The charge is "idiotic," says G. L. Tugwell, executive vice president of Engelhard. "Since he introduced the amendment in January," Tugwell went on, "we've tried to educate Mr. Williams but he either won't be or can't be told the facts."

The Engelhard Co. and Matthey-Bishop, Inc., are in effect the only refiners of platinum in the nation, and therefore virtually the only buyers of the stockpiled metal.

The government obtained its platinum in the 1950s at an average price of $79.47 an ounce, under a post-war program intended to assure the nation would have sufficient strategic materials, among them platinum, to survive in the event of war.

In recent years, with advent of the nuclear age, the government has been revising its stockpile objectives, mostly downward. Those materials considered surplus have been sold back into commercial channels. The government now proposes to sell its surplus platinum at $109 to $114 an ounce.

Platinum has been in acute short supply since 1965 when the Soviet Union, a large producer, withdrew from the world market. Aside from

said in an interview, "is that we have struggled through this to maintain a fair and reasonable price. Then this silly jerk stands up in the senate and insinuates we're making a windfall."

Tugwell notes that more than 90 percent of free world platinum production is sold at the current producer price of $109 to $114 an ounce.

Williams charged in a senate speech that "the Johnson administration is desperately trying to attain congressional approval of a bill to sell 115,000 troy ounces of platinum at $12 million below prevailing market prices."

The senator called the arrangement "a farce." He said it amounted to a handout to American industry at the taxpayers' expense.

John G. Harlan jr., head of the General Services Administration's property management and disposal service, called the windfall talk "poppycock."

Harlan said the GSA planned again to sell 77,000 ounces of the new surplus to the two companies for a few dollars less than what is now the producers price.

[HC0002][GDrive]

1969 (March) - Promotion to President of the Engelhard Industries Division of Engelhard Minerals & Chemicals Corporation

See full issue - Martime Reporter and Engineering News (March 1969) [HP0004][GDrive] . Note that if Tugwell was with **Engelhard Corporation** for 33 years as of 1969, that means he joined the corporation in 1936 when he was only 17 years old.

Engelhard Industries Promotes G.L. Tugwell And R.C. Glogau

Gilbert L. Tugwell

Richard C. Glogau

Gilbert L. Tugwell has been appointed president of the Engelhard Industries Division of Engelhard Minerals & Chemicals Corporation.

Mr. **Tugwell,** who has been with the company 33 years, also serves as a director, member of the executive committee and executive vice-president of the parent corporation.

Richard C. Glogau, who joined the firm in 1967, after 27 years with E. I. Du Pont de Nemours, succeeds Mr. **Tugwell** as executive vice-president of the Engelhard Division. Mr. **Glogau** also was elected a director, member of the executive committee and senior vice-president of the corporation.

1971 - Tugwell still with Engelhard

Full page : [HN003A][GDrive]

Elections Listed By Engelhard

Newark, N.J. (Special)—Engelhard Minerals and Chemicals Corporation announced the following elections.

Mrs. Charles W. Engelhard as a director to fill the vacancy caused by the recent death of her husband, the company's chairman, Charles W. Engelhard.

Alfred G. Blake, a director, as chairman of the board of directors. He has been associated with the company for 21 years in senior capacities. Most recently he was chairman of the Minerals and chemicals division and executive vice president of the company.

Gavin W. M. Relly, a director, as chairman of the executive committee.

Milton F. Rosenthal, president, as chief executive officer.

Gerald A. Hale, senior vice president, as executive vice president. Ludwig Jesselson and Gilbert L. Tugwell continue as executive vice presidents.

[HN003B][GDrive]

1973 (June 07)- Tugwell now a chairman at Amersil

Dec 29 1992 - Death

Gilbert Leonard Tugwell died in North Palm Beach, Florida. See full page : [HN0034][GDrive].

GILBERT LEONARD TUGWELL

Age 73, of North Palm Beach, Florida, died December 29, 1992. Mr. Tugwell was born Nov. 29, 1919 in Sussex, England. He was educated in England and served in the British Army during WW II. He emigrated to the U.S. in 1962 as an employee of Engelhard Minerals and Chemicals Corp., where he later became Executive Vice President and Director and Chairman of the Engelhard Industries Division.

Mr. Tugwell is survived by his wife, Marjorie of North Palm Beach; a daughter, Angela Fernandez of Houston, Texas and a daughter, Georgina Russo of Lancaster, Pa.; six grandchildren.

A Memorial Service will be held 10:00 a.m. Tues., Jan. 5, 1993 at St. Mark's Episcopal Church, 3395 Burns Road, Palm Beach Gardens, Florida. Those planning an expression of sympathy are asked to consider the American Cancer Society, 1724 Australian Ave., West Palm Beach, FL 33407. Arrangements entrusted to THOMAS L. PRICE FUNERAL HOME.

Ukraine International Airlines Flight 752 (**PS752**) was a scheduled international passenger flight from Tehran to Kiev operated by Ukraine International Airlines (UIA). On 8 January 2020, the Boeing 737-800 operating the route was shot down shortly after takeoff from Tehran Imam Khomeini International Airport by the Iranian Islamic Revolutionary Guards Corp.[4][5][6] All 176 passengers and crew died.[7]

The shoot-down occurred during the 2019–2020 Persian Gulf crisis, five days after U.S. President Donald Trump launched a drone strike that killed Iranian General Qasem Soleimani in retaliation for the 2019–20 attack on the United States embassy in Baghdad by Kata'ib Hezbollah, and hours after Iran launched missiles on U.S. bases in Iraq.[8]

The Iranian government initially denied responsibility for the airplane's destruction, but investigation by Western intelligence agencies and the general public revealed that the aircraft was shot down by a surface-to-air missile launched by Iran.[9] Mass protests calling for the removal of Supreme Leader Ali Khamenei broke out in Iran on 13 January in response to the shootdown and government denial, which ultimately resulted in the Iranian government admitting that it shot down the airliner.[10]

Background

The missile strike occurred four hours after Iran launched retaliatory missile strikes on U.S. positions in Iraq for the killing of Major General Qasem Soleimani.[11] Iran was on the highest state of defensive alert and, according to Commander of the Aerospace Force of the Islamic Revolution Guards Corps (IRGC) Amir Ali Hajizadeh, was "totally prepared for a full-fledged war".[8]

Aircraft

The aircraft was a Boeing 737-8KV, serial number 38124, registration UR-PSR. It was three and a half years old at the time of it being shot down, having first flown on 21 June 2016.[2] It was delivered to the airline on 19 July 2016 and was the first 737 Next Generation aircraft purchased by the airline.[12] The airline defended the airplane's maintenance record, saying it had been inspected just two days before the crash.[13][14]

Flight and crash

Crash site

Approximate location of the crash site

The flight was operated by Ukraine International Airlines, the flag carrier and the largest airline of Ukraine, on a scheduled flight from the Iranian capital Tehran's Imam Khomeini International Airport to Boryspil International Airport in the Ukrainian capital Kiev. Emergency officials confirmed that the aircraft was carrying 176 people, including nine crew members and fifteen children.[15]

Flight 752 was scheduled to take off at 05:15 local time (UTC+3:30), but was delayed. It departed Stand 116 and took off from Runway 29R at 06:12:08 local time and was expected to land in Kiev at 08:00 local time (UTC+2:00).[16][3] The final ADS-B data received was at 06:14:57, less than three minutes after departure.[17]

Between 06:14:17 and 06:14:45 the airplane turned from the take-off heading of 289° to heading 313°, following its regular route.[17][18]

According to the data, the last recorded altitude was at 2,416 metres (7,925 ft) above mean sea level with a ground speed of 275 knots (509 km/h; 316 mph).[19] The airport is 1,007 metres (3,305 ft) above mean sea level, but the ground around Parand and the crash site is several hundred feet higher. The flight was climbing at just under 3000 ft/min when the flight data record abruptly ended over the open ground near the northern end of Enqelab Eslami Boulevard in Parand.[17] Analysis of several videos by *The New York Times* shows that the aircraft was hit almost immediately by the first of two short-range missiles (which knocked out its transponder) launched thirty seconds apart by the Islamic Revolutionary Guard Corps, and with the aircraft having maintained its track, by the second missile some 23 seconds later, after which it veers right and can be seen aflame before disappearing from view.[18] Ukrainian investigators believe the pilots were killed instantly by shrapnel from the missile which exploded near the cockpit.[20]

The precise track of the aircraft is unclear from that point until about a minute before it crashed, when several videos recorded its last seconds.[21][22][23] The aircraft crashed on a park and fields on the edge of the village of Khalajabad 15 kilometres (9.3 mi; 8.1 nmi) north-west of the airport,[24] and about 10 miles (16 km; 8.7 nmi) ENE of the last missile strike about seven minutes after takeoff,[18] but did not cause any casualties on the ground.

Shortly after the crash, emergency responders arrived with 22 ambulances, four bus ambulances, and a helicopter, but intense fires prevented a rescue attempt. The wreckage was strewn over a wide area, with no survivors found at the crash site.[25] The aircraft was completely destroyed on impact.[26]

Recovery operations, victims of Flight 752

There were 167 passengers and nine crew members on the flight.[33] According to Iranian officials, 146 passengers used Iranian passports to leave Iran, ten used Afghan passports, five used Canadian ones, four Swedish ones, and two used Ukrainian passports.[34] There is some disagreement from other sources with this accounting of nationalities, possibly due to some passengers being nationals of more than a single country.

According to Ukrainian foreign minister Vadym Prystaiko and a flight manifest released by UIA,[35] out of the 167 passengers' citizenship, 82 were confirmed to be Iranian, 63 were Canadian, three were British, four were Afghan, 10 were Swedish, and three were German. Eleven Ukrainians were also onboard, nine of them being the crew.[7][29] The German Foreign Ministry denied any Germans were aboard;[36] the three people in question were Afghan nationals who lived in Germany as asylum seekers.[31] According to Iranian nationality law, the Iranian government considers dual citizens as Iranian citizens only.[37]

Of the 167 passengers, 138 were travelling to Canada via Ukraine.[38][39][40] Many of the Iranian Canadians were affiliated with Canadian universities, as students or academics who had travelled to Iran during Christmas break. The crash was the largest loss of Canadian lives in aviation since the 1985 bombing of Air India Flight 182.[41] On January 15, 2020, Canadian Transport Minister Marc Garneau said 57 Canadians died in the crash.[42]

In addition to six flight attendants, the crew consisted of Captain Volodymyr Gaponenko (11,600 hours on Boeing 737 aircraft, including 5,500 hours as captain), instructor pilot Oleksiy Naumkin (12,000 hours on Boeing 737, including 6,600 as captain), and first officer Serhiy Khomenko (7,600 hours on Boeing 737).[43]

Investigation

Impact zone

The Civil Aviation Organization of Iran (CAOI) reported shortly after the incident that a team of investigators had been sent to the crash site.[33] On the same day, the Ukrainian government said it would send experts to Tehran to assist with the investigation. President Volodymyr Zelensky instructed the Ukrainian General Prosecutor to open a criminal investigation into the crash.[44] The Ukrainian government sent 53 representatives to Iran to assist with the investigation, among them government officials, investigators, and representatives of the UIA.[45]

A Ukrainian Air Force Ilyushin Il-76 prepares to depart for Iran from the Boryspil International Airport with specialists from the National Bureau of Investigation of Civil Aviation and Incidents with the Civil Aviation Service, State Aviation Service, Ukraine International Airlines and from the General Inspectorate of the Ministry of Defense of Ukraine.

Under standard International Civil Aviation Organization (ICAO) rules, according to Annex 13 of the Chicago Convention, the United States National Transportation Safety Board (NTSB) would participate in the investigation, as they represented the state of the manufacturer of the aircraft. France's Bureau d'Enquêtes et d'Analyses pour la Sécurité de l'Aviation Civile (BEA) would participate as representatives of the state of manufacture of the aircraft's engines (a U.S.–France joint venture) and Ukraine's Ministry of Infrastructure would participate as representatives of the state in which the aircraft was registered. Given the 2019–20 Persian Gulf crisis, it is not known how these organizations would be involved, although it was reported that Iran had said American, French and Ukrainian authorities would be involved.[46]

The head of the commission for accidents in the CAOI said they received no emergency message from the aircraft before the crash.[47] It was reported that the aircraft's black boxes (the cockpit voice recorder (CVR) and flight data recorder (FDR)) had been recovered, but the CAOI said it was not clear to which country the recorders would be sent so the data could be analyzed.[48] The association said it would not hand over the black boxes to Boeing or to U.S. authorities.[49] On 9 January, the black boxes were reported, by Iranian investigators, to have been damaged and that some parts of their memory may have been lost.[50] Mary Schiavo, a former U.S. Department of Transportation inspector general, said no automated distress messages had been sent from the aircraft or by its crew.[51]

On 9 January, the Swedish Accident Investigation Authority and Transportation Safety Board of Canada (TSB) were officially invited by the investigation team to participate in the probe on the crash.[52] The NTSB,[53][54][55] Ukraine, and Boeing were also invited to participate in the investigation.[52] Due to American economic sanctions placed on Iran, U.S. investigators would need a special licence from the Treasury and the State Departments to travel there.[56][57][58]

On 9 January, media reports showed bulldozers being used to clear the crash site. Some aircraft investigation experts expressed concerns about disturbing and damaging the crash site before a thorough investigation can be conducted.[59] Iran denied bulldozing the evidence.[60] On 10 January, the Iranian government granted Ukrainian investigators permission to investigate the flight recorders and Ukrainian investigators visited the crash site,[61][62] with plans to download the recorders in Tehran.[63] On 14 January, the head of the TSB, Kathy Fox, said there were signs that Iran would allow the TSB to participate in the downloading and analysis of data from the airplane's flight data recorder and cockpit voice recorder.[64] On 23 January, the TSB announced that they had been invited by Iran to help with the flight recorders.[65]

On 2 February, Ukrainian TV channel aired a leaked recording of the information exchange between the Iranian pilot of an Aseman Airlines flight and an Iranian air-traffic controller. The pilot allegedly stated in Persian that he saw a flash similar to missile fire in the sky, and then an explosion. Following the leak, the Ukrainian President Volodymyr Zelensky said the new evidence proved Iran was well-aware from the very first moments that the Ukraine passenger airplane was brought down by a missile.[66] The following day Iran ceased co-operation with Ukraine in its investigation into the disaster due to this leaked recording.[67] Iran resumed co-operation on 15 February.[68]

Flight data recorder and cockpit voice recorder

On 20 January, Iran asked for assistance from France and the United States to recover the data from the flight data recorder and cockpit voice recorder.[69] On 5 February, Canada urged Iran to send the recorders to France.[70] Iran denied the request.[71]

On 12 March, Iran agreed to hand over the recorders to Ukraine.[72] However, the COVID-19 pandemic delayed this action.[73][74][75] During this time, impatience began to mount from Ukraine, Canada, and ICAO.[76]

On 11 June, Iran announced that the flight recorders would be sent directly to the Bureau d'Enquêtes et d'Analyses pour la Sécurité de l'Aviation Civile (BEA) in France.[77] Canadian officials urged Iran to complete this action "as soon as possible", citing the previous delays in handing over the recorders.[78] This statement was further reinforced 11 days later, when Iranian foreign minister Mohammad Javad Zarif commented on this intention during a phone call with Canadian foreign minister François-Philippe Champagne.[79]

On 20 July, the examination of the recorders started in Paris; Champagne rejected the finding by the CAOI that "human error" caused the launch of the missiles which destroyed the aircraft: "It cannot just be the result of a human error. There is no circumstance under (which) a civilian aircraft can be downed just by the result of human error in this day and age... All the facts and circumstances point to more than just a human error, so certainly we will continue to pursue vigorously the investigation."[80]

Cause of the crash

Wreckage of Flight 752, with part of an engine in the foreground, showing nozzle guide vanes

Wreckage of Flight 752

On 8 January, Iran's Road and Transportation Ministry released a statement that the aircraft burst into flames after a fire started in one of its engines, causing the pilot to lose control and crash into the ground.[81][44] The airline opined that pilot error was impossible to be cited as the cause of the crash as the pilots had exclusively been trained for the Tehran flights for years, noting that Tehran Airport was "not a simple airport".[82]

Iranian and Ukrainian government sources initially blamed mechanical issues aboard the aircraft for its crash.[27][83][84] The Ukrainian government later retracted its statement and said anything was possible, refusing to rule out that the aircraft was hit by a missile.[85] President Zelensky said there should not be any speculation about the cause of the crash.[44]

On 9 January, U.S. intelligence and defence officials said they believed the aircraft had been shot down by an Iranian Tor missile (NATO reporting name SA-15 "Gauntlet"),[86] based on evidence from reconnaissance satellite imagery and radar data.[87][52] Ukrainian authorities said a shootdown was one of the "main working theories", while Iranian authorities denied this, stating that allegations of a missile hit were "psychological warfare".[88][89][90][91] British defence officials agreed with the American assessment of a shootdown.[90] Prime Minister of Canada Justin Trudeau said evidence from multiple sources, including Canadian intelligence, suggest the aircraft was shot down by an Iranian missile.[92]

After three days of describing it as "an American lie", "a wrongful scenario by CIA and the Pentagon", and "an attempt to prevent Boeing stock from a free fall",[93][94] on 11 January, the Armed Forces of the Islamic Republic of Iran admitted they had shot down the airplane, having erroneously identified it as a hostile target.[95]

The flight had been delayed by more than an hour because the captain had decided to offload some luggage because the aircraft was over its certified takeoff weight.[96]

According to an early IRGC statement, when the airplane seemed to head toward a "sensitive military centre" of the Islamic Revolutionary Guard Corps, controllers mistook it for a "hostile target" and shot it down.[97] Iran's Civil Aviation Organization disputed this timeline, arguing that the airplane was on the correct course all the time and there was no proven flight deviation.[98] The CAOI's viewpoint was also supported by a Radio Canada International article that used public ADS-B flight tracking data.[99][100]

Iranian Brigadier general Amir Ali Hajizadeh of the IRGC Aerospace Defense said a missile operator in Bidganeh had acted independently, mistook the airplane for a U.S. cruise missile and shot it down. Hajizadeh also said the airplane was on-track and "made no mistake".[8][9]

Western experts had previously noted that Flight 752 was flying near several sensitive Iranian ballistic missile facilities, including the Shahid Modarres missile base at Bidganeh near Malard, which the Iranians could have believed would be targets of retaliation for their attack a few hours earlier.[101][102]

On 11 July 2020, the CAOI reported that Iran now blamed the missile strike that downed PS752 on "bad communication" and "poor alignment". According to the Iranians, the missile battery "had been relocated and was not properly reoriented" and the guilty parties did not include the higher-ranking chain of command officers.[103][104]

Analyses based on social media

On 9 January, the Instagram account Rich Kids of Tehran published a video captioned: *"The actual footage from the moment the #Ukrainian flight was shot down by a Russian-made Tor-M1 missile just moments after takeoff from #Tehran's Airport "*.[105][106] The video was published at the same time the Iranian authorities were claiming technical problems for the crash.[107][108] Qassem Biniaz, a spokesman for Iran's Road and Transportation Ministry, said the pilot "lost control of the plane" after a fire broke out in one of its engines, denying the Ukrainian plane was hit by a missile.[109][110][111]

On 9 January, a video was posted on a public Telegram channel showing what was, according to Bellingcat, apparently a mid-air explosion. The New York Times contacted the person who filmed the video and confirmed its authenticity. An investigation team from Bellingcat carried out an analysis of this video and geolocated it to a residential area in Parand, a suburb west of the airport.[112][113] Bellingcat also examined photos from an unknown source and said these images of a missile nose cone had yet to be verified, despite claims from several sources.[114] The Tor missile's warhead is located in its midsection, meaning its nose may not be destroyed in an explosion.[114] Similar photographs have been taken in eastern Ukraine, but none have been found

meaning its nose may not be destroyed in an explosion.[111] Similar photographs of fragments have been taken in eastern Ukraine, but none have been found to be the same as those attributed to the recent incident.[114]

USA Today reported that the firm IHS Markit reviewed photographs showing the guidance section of a missile and "assesses them to be credible".[115][116] Aviation monitoring group Opsgroup said: "We would recommend the starting assumption to be that this was a shootdown event, similar to MH17—until there is clear evidence to the contrary" asserting that photographs "show obvious projectile holes in the fuselage and a wing section".[117]

Subsequent developments

On 9 January, President Trump said the airplane "was flying in a pretty rough neighbourhood, and somebody could have made a mistake."[118] He said the U.S. had no involvement in the incident and that he did not believe a mechanical issue had anything to do with the crash.[118] U.S. intelligence sources informed U.S. media outlets they were "confident that Iran painted the Ukrainian airliner with radar and fired two surface to air missiles that brought down the aircraft."[119][120]

Also on 9 January, at a news conference in Ottawa, Canadian Prime Minister Justin Trudeau said the airliner was likely brought down by an Iranian missile, citing intelligence from Canadian and other sources, and said the incident "may well have been unintentional".[121]

On 10 January, during an interview with Sky News, Iran's ambassador to the United Kingdom, Hamid Baeidinejad, rejected video footage obtained by American media that showed bulldozers clearing the crash site as "absurd".[122] Baeidinejad further denied that an Iranian missile had brought down the airplane, and said that "[p]lane accidents are a very technical issue, I cannot judge, you cannot judge, reporters on the ground cannot judge. Nobody can judge. A foreign minister or a prime minister cannot judge on this issue."[123]

On 11 January, Iran admitted it had shot down the Ukrainian jet by "accident", the result of human error. General Amir Ali Hajizadeh, the head of the Iranian Revolutionary Guard's aerospace division, said his unit accepts "full responsibility" for the shootdown. In an address broadcast by state television, he said that when he learned about the downing of the airplane, "I wished I was dead." Hajizadeh said that, with his forces on high alert, an officer mistook it for a hostile missile and made a "bad decision".[124]

On 14 January, the Rich Kids of Tehran Instagram account published a new video, showing two missiles hitting the aircraft.[125] The security camera footage, verified by *The New York Times*, shows two missiles, fired 30 seconds apart.[126] On 20 January, the Civil Aviation Organization of Iran also admitted that the country's paramilitary Revolutionary Guard had fired two Russian-made Tor-M1 missiles at the aircraft.[127][128]

On 10 August, IRGC officer Gholamreza Soleimani told Iranian state TV that Iran will not compensate Ukraine International Airlines for the shootdown because the "plane is insured by European companies in Ukraine and not by Iranian companies".[129]

Aftermath

Commemoration of the victims of the air crash in Iran at Kyiv Boryspil airport

Commemoration of the victims of the air crash in Iran

On 17 January, the Canadian government announced that it would provide C$25,000 to the relatives of each of the 57 Canadian citizens and permanent residents who were killed in the crash. The funds were to help cover immediate needs, like funeral and travel expenses. However, Canadian Prime Minister Justin Trudeau also said that it holds Iran financially responsible.[130]

On 19 January, the bodies of 11 Ukrainian citizens, who died in the crash, were returned to Ukraine in a solemn ceremony at the Boryspil International Airport. The coffins, which were each draped in a Ukrainian flag, were carried one by one from a Ukrainian Il-76 military plane of the 25th Transport Aviation Brigade.[131]

President Zelensky, Secretary of the National Security and Defense Council of Ukraine Oleksiy Danilov, Prime Minister Oleksiy Honcharuk, Chairman of the Verkhovna Rada Dmytro Razumkov, and other officials and military servicemen participated in the commemoration.[132]

Reactions

Air traffic

The disaster occurred amid a heightened political crisis in the Persian Gulf, hours after the Iranian military launched 15 missiles towards U.S. military airbases in Iraq in response to the Baghdad International Airport airstrike which killed Iranian general Qasem Soleimani. In response, the U.S. Federal Aviation Administration (FAA), in a notice to airmen (NOTAM), banned all American civil aircraft from flying over Iran, Iraq, the Gulf of Oman and the Persian Gulf.[133][134] Although the FAA's NOTAM is not binding on non-U.S. airlines, many airlines take it into consideration when making safety decisions, especially after the downing of Malaysia Airlines Flight 17 in 2014.[135][136][137] Several airlines, including Austrian Airlines,[52] Singapore Airlines,[138] KLM,[139] Air France,[140] Air India,[140] SriLankan Airlines,[141] Qantas[135] and Vietnam Airlines[142] began to reroute their flights. Other airlines, such as Lufthansa, Emirates, Flydubai, and Turkish Airlines cancelled some flights to airports in Iran and Iraq and would make further operational changes as necessary.[137][143][144][145]

Ukraine International Airlines (UIA) suspended flights to Tehran indefinitely shortly after the incident, with flights after the day of the crash no longer available.[7] The suspension also complied with a prohibition issued by State Aviation Administration of Ukraine for flights in Iran's airspace for all Ukrainian registration aircraft.[146] Since the crash, additional airlines, Air Astana and SCAT Airlines also re-routed flights that overflew Iran.[147][148] This followed a recommendation by the Kazakhstan Ministry of Industry and Infrastructure Development, issued to Kazakhstani air companies after the crash, to avoid flying over Iran airspace and/or to cancel flights to Iran.[149] Air Canada rerouted its Toronto-Dubai flight to fly over Egypt and Saudi Arabia instead of Iraq.[150]

Iran

Government and IRGC

Iran declared 9 January a national day of mourning both for the victims of Flight 752 and for those killed in a stampede at Qasem Soleimani's funeral.[151]

On 11 January, the Iranian Islamic Revolutionary Guard Corps said they had shot down the aircraft after erroneously identifying it as a hostile target.[152]

President Rouhani called the incident an "unforgivable mistake".[153] Foreign minister Mohammad Javad Zarif apologized for the disaster and added that the preliminary conclusion of the armed forces' internal investigation was "human error".[154]

On 17 January, Iranian Supreme Leader Ali Khamenei, in his first Friday sermon in eight years, defended the Revolutionary Guards' accidental killing of passengers[*dubious* – *discuss*] and praised Operation Martyr Soleimani for giving a "slap on the face" to the United States. His sermon came as public anger mounted against the government for their handling of the incident.[155]

In April, an Iranian MP, the spokesman for the Iranian parliament's legal and judicial committee, said the Iranian military "carried out their duties well", adding that "the movement of the plane was very suspicious" and that no arrests had been made in relation to the incident.[156][157]

Anti-government protests

Main article: Ukraine International Airlines Flight 752 protests

A gathering at Amirkabir University of Technology. Above flowers and lit candles a notice reads "What is the cost of lying?"

On 11 January, in response to the government's admission, thousands of protesters poured into the streets of Tehran and other Iranian cities such as Isfahan, Shiraz, Hamadan and Urmia.[158] Video clips on Twitter showed protesters in Tehran chanting "Death to the dictator", a reference to Supreme Leader Ali Khamenei.[159] In Tehran, hundreds of protesters took to the streets to vent anger at officials, calling them liars for having denied the shootdown. Protests took place outside at least two universities: students and protesters gathered at Sharif University, Amirkabir University and Hafez Overpass in Tehran, initially to pay respect to the victims. Protests turned angry in the evening. President Trump tweeted support for the protests.[160][161][162] The mourning Iranians called Qasem Soleimani a murderer and tore up pictures of him, shattering the appearance of national solidarity that had followed his death.[163][164][165][166][167][168]

On 12 January, protests erupted across Iran for a second day; in Tehran and in several other cities, protesters chanted slogans against the leadership and clashed with security forces and Iran's Basiji Force firing tear gas at the protesters.[169] The protesters chanted that they needed more than just resignations, but prosecutions of those responsible as well.[170] Tehran residents told Reuters that police were out in force in the capital on 12 January, with dozens of protesters in Tehran chanting "They are lying that our enemy is America, our enemy is right here," and scores of demonstrators gathered in other cities also shown on social media.[171]

On 13 January, the *Los Angeles Times* reported that Iranian security forces fired both live ammunition and tear gas to disperse demonstrators.[172]

Iran's exiled Crown Prince Reza Pahlavi said the Islamic Republic Supreme Leader Ali Khamenei was responsible for the downing.[173] Iranian reformist newspaper *Etemad* ran the banner headline "Apologize and resign", and commented on the "people's demand" for the removal of those responsible for the shootdown.[174]

A Khamenei representative in the elite Revolutionary Guards, told a gathering of Khamenei's representatives in Iranian universities that the *Assembly of Experts*, the clerical body that chose Khamenei, "... do not appoint the Supreme Leader, rather they discover him [...] In the Islamic system, the office and the legitimacy of the Supreme Leader comes from God, the Prophet and the Shi'ite Imams".[175]

Amnesty International reported on 15 January that on 11 and 12 January Iranian security forces used tear gas, pointed pellets and pepper spray against peaceful demonstrators protesting the government lying about shooting down the passenger plane.[176]

Funerals

Iran's security forces were on alert not to let people turn funerals of the plane crash victims into demonstrations. Nevertheless, in some Iranian cities such as Isfahan and Sanandaj, participants in these funerals have shown their anger and shouted anti-government slogans.[177] The supreme leader Ali Khamenei praised the country's armed forces and described the protesters as those deceived by foreign media.[178]

Arrests

On 14 January 2020, Iran's judiciary announced that several arrests had been made over the accidental shooting down of the aircraft. The spokesman, Gholamhossein Esmaili, did not name any suspect or say how many had been held.[179][180] In a televised speech, President Rouhani said the judiciary would assemble a special court with a high-ranking judge and tens of experts to oversee the investigation.[181]

On 14 January, it was announced that Iranian authorities had arrested the person who had published a video of the aircraft being shot down. An Iranian journalist based in London who initially posted the footage insisted his source was safe, and that the Iranian authorities had arrested the wrong person.[182] According to Tasnim News Agency and the semi-official Fars News Agency, Iranian authorities are looking for the person(s) who distributed the video.[183]

Families of the victims

Iran's Radio Farda reported that according to Zeytoun (a foreign-based Persian website) Iranian intelligence agents forced families of the victims to give interviews on state TV, declaring their support for the Iranian government or else the government would not deliver the bodies of the victims.[184]

In February, in Toronto, a proposed class action claim was filed in the Ontario Superior Court of Justice against Iran, Iranian Supreme Leader Ali Khamenei, and various branches of the Iranian military, among others.[185][186] Lawyers of the families of Canadian victims are seeking compensation of at least $1.1 billion.[187][188]

On 3 April 2020, the families of the victims formed an association in Toronto, Ontario, Canada, to follow the case through legal avenue. The association's spokesman, Hamed Esmaeilion, said the association's aim is, "to bring the perpetrators of the crime to justice, including those who ordered it".[189] In July 2020, Esmaeilion was outraged that the ICAO had yet to condemn the incident, and pointed out that the ICAO needed only three months to adopt a unanimous resolution condemning in the strongest terms the destruction and alleged murders of Malaysia Airlines Flight MH17.[190]

Ukraine

President Zelensky expressed condolences to the relatives of the victims[191] and cut short his diplomatic visit in Oman. He later added that several aircraft had been prepared in Kiev to travel to Tehran to transport the dead. He declared 9 January a national day of mourning, with Ukrainian flags flying at half-mast on government buildings. He also announced unscheduled inspections on every airliner in the country and asked Ukrainians to refrain from visiting Iran and Iraq for the time being.[192] On 11 January Zelensky said, "Ukraine insists on a full admission of guilt. We expect Iran to bring those responsible to justice, return the bodies, pay compensation and issue an official apology. The investigation must be full, open and continue without delays or obstacles."[193]

justice, return the bodies, pay compensation and issue an official apology. The investigation must be full, open and continue without delays or obstacles.[193]

On 13 January, Ukraine's Foreign Minister, Vadym Prystaiko, said five of the countries that had citizens on board the airliner—Canada, Ukraine, Afghanistan, Sweden and an unnamed country—would meet in London on 16 January to discuss possible legal action.[64]

Canada

Prime Minister of Canada Justin Trudeau speaks to media

With the large loss of Canadian life, Canadian Foreign Affairs Minister François-Philippe Champagne and Transport Minister Marc Garneau both expressed sympathy for the victims. Champagne announced that he was in touch with the Ukrainian government, and Garneau announced that Canada was offering assistance in the investigation.[194] Prime Minister Justin Trudeau insisted on transparency and justice for the families and loved ones of the victims.[193] On 14 January, Trudeau said tensions and escalation between Iran and the United States were responsible for the shootdown.[195][196]

On March 31, Prime Minister Justin Trudeau announced the appointment of Ralph Goodale as Special Advisor to the Government of Canada.[197] Goodale will "examine lessons learned" from Flight 752, Ethiopian Airlines Flight 302, Air India Flight 182 and other air disasters and "develop a framework to guide Canada's responses to international air disasters."[198]

United Kingdom

Prime Minister Boris Johnson called for the repatriation of the bodies of the dead and pledged to work with Canada and Ukraine.[193]

Ambassador of the United Kingdom to Iran, Robert Macaire was arrested on 11 January 2020 during protests in Tehran but released shortly afterwards.[199][200] The ambassador was detained on suspicion that he had joined demonstrations against the government; he denied this and clarified that he had attended an event advertised as a vigil, to pay respects to the victims, and had left five minutes after people started chanting. The British government called his arrest a "flagrant violation of international law".[200] Macaire had been arrested 30 minutes after leaving the vigil he said he had attended, according to *The Guardian*.[201] The following day Macaire was summoned to the Ministry of Foreign Affairs, in order to explain his presence during the protest.[202] The U.S. has urged the Iranian regime to issue the British ambassador a formal apology for disregarding his rights and to reiterate that all the rights of diplomats should be respected.[203]

'There are no words': York Region Iranian-Canadian community mourns plane crash victims

'Right now, everyone is completely united in grief': Kaveh Sahrooz

News Jan 09, 2020 by Kim Zarzour , Sheila Wang YorkRegion.com

Iranian Plane Crash - Flag half mast

A flag at Richmond Green Secondary School in Richmond Hill flies at half mast Jan. 8 after the Ukranian International Airlines crash near Tehran, Iran. - Steve Somerville/Torstar

While all of Canada mourns the loss of 57 citizens and dozens more residents in the Ukrainian International Airlines tragedy in Iran, the Iranian-Canadian community is particularly impacted by the incident.

York Region is home to many Iranian-Canadians, with the largest number in Richmond Hill.

Majid Jowhari, MP for Richmond Hill MP, released a statement on Jan. 8 to extend his condolences to the families and friends of the passengers on the flight that crashed in Iran.

"There are no words at this time to ease the grief we all feel," said the Iranian-born Liberal MP, who was re-elected to represent Canada's most Iranian riding in 2019.

Kaveh Sahrooz, Iranian-Canadian lawyer and human rights activist, said the expat community is grief-stricken.

"All morning I've been reading messages on social media from people who knew someone on the flight," he said. "We are a growing community but at the end of the day, we are a relatively small community and everyone knows everyone."

He said Iranian-Canadians had been divided lately surrounding the issues of Trump and Soleimani, but that division has been pushed aside.

"Right now, everyone is completely united in grief."

Majid Zohari, a Richmond Hill Iranian-Canadian, said most people in the community have been impacted in some way.

"Iranians have large families," he said. "Everybody has relatives home in Iran."

The overwhelming feeling, he said, is one of confusion.

"Everybody's confused about what has happened," he said. "We are all hearing different stories from different sources."

Many are wondering about the coincidental timing of ballistic missiles launched by the Iranian regime occurring at the same time as the plane crash, he said.

"This is huge. We don't know if there is a tie between."

Reza Moridi, an Iranian-Canadian and former MPP for Richmond Hill, said the community is devastated.

"Our community has been going through so much," he said. "(Iran) was once such a wonderful country."

He referred to deaths and imprisonment under the regime and recent events with the U.S., saying the expat community worldwide worried about what would come next.

"And then we wake up this morning to another tragedy — the plane crash. It has been really tough on our community."

Former Richmond Green Secondary School teacher, Mojgan Faghani, said the news about tragedy was "devastating", adding "I hope it's an accident".

Faghani found out that Richmond Green student Arad Zarei, 17, was a passenger on that plane through a message from a previous colleague.

A passenger jet heading to Ukraine from Iran crashed minutes after taking off in the Iranian capital of Tehran, killing 176 people on board, including 138 people who were booked on a connecting flight to Toronto, which included 63 Canadians, according to Prime Minister Justin Trudeau, Ukrainian officials and friends of the victims.

Ukrainian International Airlines has released a list of the passengers on board the plane, which was headed to the Ukrainian capital, Kyiv.

Several of the victims either lived in, or had close ties with, York Region.

Jowhari said his office is in touch with Global Affairs Canada and is able to provide updates and assistance to all those affected as necessary.

Those who are directly impacted are encouraged to contact the MP's office at majid.jowhari@parl.gc.ca or 905-707-9701, or Global Affairs Canada's 24/7 Emergency Watch and Response Centre at 1-613-996-8885 or 1-800-387-3124, or sos@international.gc.ca.

Canadian citizens in Iran requiring consular assistance should contact the Canadian Embassy in Ankara at +90 (312) 409 2700 or call Global Affairs Canada's Emergency Watch and Response Centre at +1-613-996-8885.

Newlyweds, university students and families from across Canada among Iran plane crash victims

By Star Staff

Wed., Jan. 8, 2020timer62 min. read

Early Wednesday morning, a passenger jet heading to Ukraine from Iran crashed minutes after taking off in the Iranian capital of Tehran, killing 176 people on board, including 63 Canadians and several people with connections to Canada, according to Ukrainian officials and friends of the victims.

Ukrainian International Airlines has released a list of the passengers on board the plane, which was headed to the Ukrainian capital, Kyiv.

The airline said most passengers were transiting through Kyiv to other destinations. The airline offers an inexpensive connecting flight from Kyiv to Toronto's Pearson International Airport.

In a flood of tributes posted to social media, friends of some listed passengers identified them as university students, professors and professionals returning to Canada after the winter break.

Neda Sadighi, GTA

Dr. Neda Sadighi.

A clerk at a Richmond Hill eye clinic confirmed that optometrist Dr. Neda Sadighi was on the plane after visiting Tehran for 10 days on vacation. According to the clinic's website, Sadighi is an eye surgeon who started practising in Tehran before coming to Canada. She's a member of the College of Optometrists of Ontario, and the Iranian Association of Ophthalmologists.

Joe Belden, who worked alongside Sadighi at Optical Eyeworks in Richmond Hill, Ont., said office staff were aware of Sadaghi's travels to Iran and had learned of her death directly from her family members.

Belden said clinic staff were struggling to come to terms with the death of their only doctor, who he described as an amazing person.

"She was really helpful to disadvantaged people," Belden said. "She treated everybody with respect no matter their background. She was kind all the way around."

Suzan Golbabapour, GTA

Suzan Golbabapour.

At a Remax office in Richmond Hill, a realtor said real estate agent Suzan Golbabapour was also a passenger on the plane, after travelling to Iran last month for holidays.

University of Waterloo students Marzieh (Mari) Foroutan and Mansour Esnaashary Esfahani

University of Waterloo students Mari Foroutan and Mansour Esnaashary Esfahani.

A spokesperson with the University of Waterloo said they are aware the names of two PhD students, Marzieh (Mari) Foroutan and Mansour Esnaashary Esfahani, listed among the dead on the flight.

Foroutan was a student in the university's geography department, while Esfahani studied civil engineering, the school said.

A friend of Foroutan's, Jaya Sree Mugunthan, told the Star she was an Iranian international student at the school, calling her an "ambitious person."

In her 30s, Foroutan was described by her friend Jacqueline Eenkooren as a "powerful woman who put everyone else before herself," in a Facebook message to the Star.

Foroutan was "so sincere, gracious, and generous" and "ridiculously humble" despite her many academic achievements, Eenkooren said. She did an animated Ted Talk entitled "Could We Actually Live on Mars?" that discussed the unique features of the red planet. Her research focused on "the application of new algorithms and technologies in remote sensing to study climate change."

She also researched "planetary extremes from hyper-arid hot deserts to freezing worlds," according to her University of Waterloo profile on the university's website.

"She was always looking for little opportunities to treat other people around her. She'd buy you a cookie, just because, and pretend to get angry if you tried to decline in any way," Eenkooren said.

"Amazing how someone who is so quiet and understated could be so strong and be such a force to be reckoned with at the same time. There will never be another Marzieh."

University of Guelph students Milad Ghasemi Ariani and Ghanimat Azhdari

Milad Ghasemi Ariani.

Ghanimat Azhdari, University of Guelph student

The University of Guelph also confirmed two of its PhD students were passengers: Ghanimat Azhdari, who was doing work in indigenous conservation in the Department of Geography, Environment and Geomatics; and Milad Ghasemi Ariani, who was pursuing a PhD in the Department of Marketing and Consumer Studies.

The university originally said Azhdari's partner was also on the plane, but later said it could not confirm that was the case.

University of Guelph associate professor Faisal Moola confirmed in a tweet that Azhdari was one of his PhD students. "Ghanimat was on her way back to @uofg after visiting her family and traditional Indigenous territories in Iran over the December break. The students and I are in so much pain," he wrote.

"Ghanimat was an Indigenous person who was born into the nomadic Qashqai tribe in southwestern Iran," Moola added in a statement to the Star, adding: "The one thing that brings me a little comfort in coping with Ghanimat's death is the knowledge that my dear student was a powerful and passionate young leader in defence of Indigenous peoples and their territories, and that her life's work will continue."

Ariani is being remembered as a student who would be there for his classmates when they had a problem, or needed someone to talk to.

"He was really caring because he was helping other students," Towhid Islam, a professor and researcher with the University of Guelph's Gordon S. Lang School of Business and Economics, told the Guelph Mercury Tribune.

"Typically doctoral students are mature — they have families, children, multiple problems, they don't have enough money. I found him helping other people, counselling them and motivating them."

University of Alberta professors Mojgan Daneshmand and Pedram Mousavi, with daughters Daria and Dorina

Pedram Mousavi, 47, Mojgan Daneshmand, 43, and their daughters, Daria Mousavi, 14, and Dorina Mousavi, 9, seen in this family photo posted to Pedram Mousavi's Facebook account in 2014.

Masoud Ardakani, the University of Alberta's associate chair of electrical and computer engineering, confirmed in an email that professors Mojgan Daneshmand and Pedram Mousavi were on the flight, along with their daughters Daria and Dorina.

Nooran Ostadeian, who has known them since 2010 when she helped them find a home as a real estate agent, said the couple was among her closest friends in Edmonton.

"They were like an example of the happiest couple that I've ever known in my life," Ostadeian said. "I want them to be remembered as a symbol of love, community members who did a lot of dedication and contribution to the community. Great teachers for their students."

Friend Arezu Omaraee called the loss unbearable.

"They were more than friends, they were our family basically here," she said at a memorial.

"They were hard working, scientists, beautiful hearts, angels really."

Omaraee said they received a text from Pedram Mousavi from the airport and he was anxious to get out of Iran.

"He said, 'I just want to get out of this mess,'" she recalled. "But still he was joking about it. He always had this funny, cheerful attitude about everything."

Hossein Saghlatoon, who did his PhD and post-doctorate studies under Mousavi, said he has known the family for about six years.

"I was crying my eyes out," he said. "It's not just that I was working with them or that he was my boss. He was a friend. He was like a father to me."

Saghlatoon said it took him several hours to confirm the information before he told his colleagues one by one.

"Both of them were amazing, sweet people. They were so kind, irreplaceable," he said.

Sina Ghaemi, an engineering professor at the University of Alberta, knew Mousavi for about six years. Their offices were next door to each other.

"He was a really fun person and always laughing," Ghaemi said. "He was a very happy person."

Yeganeh Molazem said Pedram, Mojgan, Daria and Dorina were her family away from home.

"They treated everyone around them with love and kindness," she said through tears at a memorial in Edmonton. "Daria and Dorina were like my little sisters — the most incredible girls I ever knew. They were so smart, hardworking, compassionate and always with a smile on their face."

Yolazem said Daria just turned 14 and Dorina would have turned 10 in March.

"The world has lost two of the most beautiful souls," she said.

Siavash Maghsoudlou Estarabadi, wife Azaden Kaveh and daughter Paria

McMaster University confirmed Wednesday that Siavash Maghsoudlou Estarabadi, a former post-doctoral fellow in the faculty of health sciences who left the university in 2018, was listed as a passenger.

An Iranian friend of Maghsoudlou Estarabadi's in Hamilton, who did not want her name published for fear of retribution if she returns to Iran, said he was travelling with his wife, Azaden Kaveh, and 15- or 16-year-old daughter, Paria. They were also listed as passengers.

The family was living in Sweden, the friend said.

Dr. Sarah McDonald, a professor in McMaster's department of obstetrics and gynecology who worked with Maghsoudlou Estarabadi in Hamilton, remembered him as "a kind and thoughtful person." She said his research focused on the important issue of the causes of preterm birth.

Daniel and Dorsa Ghandchi

According to a 2017 McMaster newsletter, Maghsoudlou Estarabadi had joined the department of obstetrics and gynecology as a post-doctoral fellow in perinatal clinical epidemiology. He completed his PhD from the Karolinska Institute in Sweden and received his doctorate of medicine from Iran University of Medical Sciences.

Iman Ghaderpanah and Parinaz Ghaderpanah, Toronto

Iman Ghaderpanah and Parinaz Ghaderpanah.

Sam Green, the owner of a GTA real estate agency, said Toronto-based mortgage broker and realtor Iman Ghaderpanah was on the plane travelling with his wife, Parinaz Ghaderpanah, on holiday.

wife, Parinaz Ghaderpanan, on holiday.

“They are just a young couple, and they were building a life together,” Green said. “It’s a tragic situation.”

Nima Ahmadi, the vice-president of the Tirgan Festival, said Parinaz was a member of the non-profit’s funding committee and was a “brilliant lady,” who used her background in banking to help the organization. She worked at RBC, he said.

“She was a very, very beautiful person inside and out,” he said. “I’m going to miss her.’”

Her husband was also a sponsor of the festival. He said they were both in their early to mid-30s and coming back from visiting their parents in Iran.

Parinaz was a branch manager at a Toronto RBC, the bank confirmed to employees, and her husband had also worked at the bank for a time.

In a note to bank staff, she was remembered as a strong and dedicated leader.

“She embodied the best of RBC and we were incredibly lucky to have known and worked with her for the past nine years,” the note read.

“Her presence on the ship will be sadly missed, and she will be missed dearly by her branch, the Toronto northeast market and all of the lives she touched in RBC.”

Parisa Eghbalian and her daughter Reera Esmaeilion, GTA

Hamed Esmaeilion (left) of Log Home Dental in Caledon East is mourning the loss of his wife, Parisa Eghbalian, and daughter Reera Esmaeilion.

Dr. Hamed Esmaeilion of Log Home Dental in Caledon East gave permission to confirm he is mourning the loss of his wife, Dr. Parisa Eghbalian, and daughter Reera Esmaeilion, said office manager Leanne Robertson.

Robertson said Eghbalian and the couple’s daughter were on the trip to attend his wife’s sister’s engagement party.

Esmaeilion and Eghbalian also ran Aurora E&E Dentistry in Aurora together. According to that clinic’s webpage, Eghbalian was born and raised in Iran, and graduated from Tabriz University of Medical Science in 2001. Prior to immigrating to Canada in 2010, she worked as an associate for nine years. In her spare time, she enjoyed reading and watching movies with her husband and young daughter.

At the Aurora office, assistant Manija Ghotbi told the Star that owner Eghbalian had left for vacation last month with her daughter.

We’re all devastated,” Ghotbi said.

Faezeh Falsafi and her two children, Daniel and Dorsa Ghandchi, GTA

Faezeh Falsafi, with her son Daniel Ghandchi and daughter Dorsa Ghandchi

Daniel, 9, and Dorsa, who would have been 17 this week, were travelling with their mother Faezeh, 46. Their father Alireza Ghandchi spoke to the Star from Frankfurt airport, where he’s on route to Tehran for their funerals.

Daniel was a “cute” little boy he said, and Dorsa was a “super talented” artist, who loved making YouTube videos and playing piano. A photo from her birthday last year shows her beaming next to a cake, and black and gold balloons, her little brother smiling mischievously beside her. His wife had studied mechanical engineering in Iran and was close to graduating from an immigration consultant program here in Canada. In the meantime she was working as a realtor.

“After this life is meaningless for me,” he told the Star. “I don’t know how I can continue.”

What he wants now is just to know what happened to the doomed plane.

“I’m not a political person,” he said, but “it’s our right to know.”

Falsafi had worked at Homelife Bayview Realty Inc. since 2016, said colleague Olga Moss, calling her an “amazing” and “very hard-working” person.

“She’s gone with her two kids,” Moss said. “It’s just gut wrenching.”

Ardalan Ebnoddin-Hamidi and Niloofar Razzaghi, their son Kamyar Ebnoddin-Hamidi, Metro Vancouver

Niloofar Razzaghi, her husband Ardalan Ebnoddin-Hamidi and their son Kamyar Ebnoddin-Hamidi lived in Port Coquitlam, B.C.

Ardalan Ebnoddin-Hamidi, his wife Niloofar Razzaghi, and their teenage son Kamyar Ebnoddin-Hamidi are confirmed to have been on the flight. Razzaghi’s name does not appear on the official flight manifest, but multiple sources have confirmed to the Star she was on board.

The family was from Metro Vancouver, according to the chair of the Tricity Iranian Cultural Society. Behzad Abdi said he and Ardalan had known each other since going to university in Iran and that Ardalan had come to Canada as a civil engineer specializing in tunnels to help build the SkyTrain Evergreen extension to Coquitlam.

“When he worked he was very serious,” Abdi, said of his friend. “But he was a funny guy as well.”

Abdi said Ardalan was an active volunteer and helped organize many events through the society. His wife had just finished training to become a teacher two months ago.

Jessi Eiriksson, 15, said through tears that Kamyar was one of her best friends. Both were in Grade 10 at Riverside Secondary School in Port Coquitlam, B.C.

“He was the most caring person I have ever met. He was always there for me and he would be there for anybody whenever they needed someone to talk to,” she sobbed.

“It’s the hardest thing losing him.”

He loved making music and wanted to become a producer when he was older, she said.

She said he also enjoyed playing soccer for fun and they would often kick a ball around together.

“He was shy except he’s just such a loving person that everyone loves Kamyar. He makes everyone happy just with his smile and a joke.”

The University of British Columbia said Razzaghi graduated with a bachelor of science in math in 2010 and a bachelor of education in 2018.

York University student Sadaf Hajiaghavand

York University student Sadaf Hajiaghavand.

Friends of Sadaf Hajiaghavand, 27, confirmed that she was a second-year human resources student at York University. Naz Moayed said that Hajiaghavand quickly became one of her closest friends after the women who met at York University bonded over the discovery that they both arrived in Canada mere days apart from each other in 2016.

“It’s really hard,” Moayed said. “I can’t believe that she’s not here. I just spoke with her two days ago.”

Moayed said Hajiaghavand was a Canadian permanent resident and was in Iran visiting family for 10 days.

“She was kind and into fashion,” she said. She said Hajiaghavand worked two jobs including as a beauty consultant at a Toronto cosmetic store. She also pursued modelling on the side.

Arash Pourzarabi and Pouneh Gorji, Edmonton

Newlyweds Arash Pourzarabi, left, and Pouneh Gorji.

Also on the plane were young newlyweds Arash Pourzarabi and Pouneh Gorji, of Edmonton. Payman Paseyan, a member of the Iranian-Canadian community in Edmonton, said they’d married just days before boarding the plane.

Pourzarabi was working on a graduate degree in artificial intelligence at the University of Alberta, and his supervisor, Prof. Michael Bowling, said the couple loved to spend their free time exploring new parts of Edmonton.

Bowling described Pourzarabi as “so bright.”

“Not just smart, which you have to be doing a graduate degree in artificial intelligence,” he said in an email, “but he brought a brightness to each meeting … particularly with his smile.”

Alina Tarbhai and her mother, Afifa Tarbhai, Toronto

"There are some who bring a light so great to the world that even after they have gone the light remains," wrote COPE 343 when announcing the death of Alina Tarbhai

Afifa Tarbhai.

The Ontario Secondary School Teachers’ Federation confirmed one its members, Alina Tarbhai, was on the flight.

“All of us who work at OSSTF/FEESO’s Provincial Office in Toronto are shocked and deeply saddened by the loss of our colleague,” the federation said in a release.

“Alina was a valued employee, and part of a tightly-knit team at Provincial Office. She was respected and well-liked by all. Her passing represents a profound loss for all of us who worked with her.”

Her mother, Afifa Tarbhai, was also among the victims in the plane crash.

“On behalf of everyone at the City of Markham, we send our deepest condolences to a team member, Muhammad Tarbhai, a Markham aquatic staff member who lost his mother and his sister Alina,” Mayor Frank Scarpitti wrote on Twitter. “This unimaginable tragedy has affected us all.”

Cope Local 343 also shared their condolences in a post over Instagram.

“Our hearts, love and strength is with the family, colleagues, and friends of fellow COPE 343 Sister Alina Tarbhai and her mother Afifa Tarbhai who were victims of the plane crash in Tehran, Iran.”

Toronto Grade 10 student Maya Zibaie and her mother, Shahrzad Hashemi

Northern yearbook photo of Maya Zibaie.

Shahrzad Hashemi

Shahrzad Hashemi and her daughter, Maya Zibaie, were also on the flight. They were returning to Toronto, after a few weeks of vacation in Iran, according to Ramin Moradzadeh, a longtime family friend.

Hashemi’s husband, Mahmoud, had also travelled with them to Iran, but had to come back earlier because of a job prospect he had applied for.

“They were new to Canada,” said Moradzadeh, noting the family of three were living in the city’s west end near Eglinton and Bathurst. Mahmoud rushed back to Iran after the tragedy.

“They are so wonderful, so kind. I just lost a part of my life.”

Northern Secondary School principal Adam Marshall confirmed to the Star that Maya Zibaie was a Grade 10 student and had been at the school for two years.

“It’s pretty devastating,” he said.

In a statement sent to parents and the school community, Marshall described her as “kind, happy and well-liked by her peers.”

“She was new to Canada, enjoyed attending high school and often shared with staff how excited she was about her future and reaching her academic goals. Maya will be sorely missed.”

Alvand Sadeghi, his wife, McGill student Negar Borghei, his sister Sahand Sadeghi and niece Sophie Emami, Toronto

Negar Borghei, her husband Alvand Sadeghi

Sophie Emami

Sophie Emami

Negar Borghei was “the type of sister you could rely on,” Hamidreza Borghei, who said his sister was loved by colleagues, family and friends alike.

“Because of her, I believed that having an older sister is a blessing,” he said. “She did everything with a smile on her face. She was perfect.”

Negar, a master’s student at McGill University, was killed along with her husband, Alvand Sadeghi, a web developer working in Toronto.

Sadeghi’s sister, Sahand Sadeghi, and her daughter, Sophie Emami, a senior kindergarten student at Lillian Public School in Toronto, were also killed.

Amirhossein Maleki, a cousin of Negar’s, told the Star that she had already received a master’s in Iran, but was pursuing another in Canada. Her husband, Alvand — a skilled pianist, according to Maleki — moved here after her.

Hamidreza said Negar would take the train to Toronto every weekend to see her husband, who he said was like a “brother” to him. He believed that Alvand was “the perfect match” for his sister: they were both calm, collected, warm and hard-working.

“They were lovebirds: you never saw them fight or argue. And there was no tension, even when they were apart for work and school. If anything, they were more in love because of the distance,” Hamidreza said.

Sahand was “the most hospitable person,” Hamidreza said. And Sophie, her daughter, was “an angel.”

Hamidreza said that two days before the family was set to depart Sophie wanted to practise her English. Hamidreza helped her out.

“We made a menu with food on it. And she put ‘poutine,’ the most Canadian food ever, as her first item. Then ice cream and jelly beans and cake.”

Sophie seemed “homesick for Canada” the whole trip, Hamidreza says.

In a statement, the Toronto District School Board said Sophie was an amazing child who was dearly loved by her teachers and classmates.

“She always had a smile and hug for everyone,” a statement said.

Hamidreza said he wanted to thank “everybody in Canada” for giving his sister “freedom, peace and hospitality.”

“I’m so glad she chose Canada; it was the land that gave her freedom — and we will never forget that.”

Toronto architect Mahdieh Ghassemi, and her children, Arsan Niazi and Arnica Niazi

Toronto architect Mahdieh Ghassemi.

Mahdieh Ghassemi, a Toronto architect, her son Arsan Niazi, 11, and daughter Arnica Niazi, 8, were also on board the plane that crashed, according to Nitin Malhotra, the founder of N Architecture Inc.

Ghassemi had worked at the firm for five years according to Malhotra, who described her as a “rock star” in her field and said that she’d left “a lasting impression” due to the nature of her job.

Malhotra said that right before she flew to Iran, Ghassemi had won an urban design award for a Tim Hortons that she’d designed in Brampton.

“You really can’t get any more Canadian than that,” he said.

The Toronto District School Board confirmed Arsan was a Grade 6 student at Pleasant Public School who was enrolled in the extended French program for three years, a letter that went out to parents states. “He is a wonderful example of kindness and will be sorely missed by our students and staff,” the letter states.

Arnica Naizi was in Grade 3 at Finch Public School, where she was being remembered for her “bright smile, positive spirit and kindness to all.”

McMaster University students Iman Aghabali and Mehdi Eshaghian

Iman Aghbali and Mehdi Eshaghian

McMaster University confirmed that two PhD students in the Faculty of Engineering were believed to be on board, Iman Aghabali and Mehdi Eshaghian.

“McMaster is a tightly knit community and there will be many faculty, staff, colleagues, friends and fellow students who need our support and caring at this tragic time,” said president David Farrar in a statement.

According to McMaster’s website, Aghabali received his bachelors in electrical engineering, and joined McMaster as a PhD student to pursue his research interests under supervision of professor Ali Emadi in McMaster automotive resource centre, in 2017. His research focused on design and control of power electronics converters in hybrid electric vehicles applications.

The website says Eshaghian joined MARC in 2018 to pursue his master’s degree, and then PhD in mechanical engineering. He had previously graduated from Sharif University of Technology in Tehran.

The McMaster Iranian Student Association also paid tribute to the two.

“Mehdi and Iman were two kind souls who always celebrated Iranian traditions with our community,” the association said.

“It is devastating for the entire McMaster community to hear the painful passing of young students who left behind their families and motherland in hopes of a better future career.”

Ali Mazaheri said his best friend Eshaghian would have turned 25 in a week.

He said Eshaghian had been seeing friends and family and was on the flight because it was the cheapest route back to Canada.

Mazaheri said the two last saw each other 11 days ago and went shopping, visited a tea house and took photos.

“When we said goodbye he told me maybe I can’t see you again, so if I can’t, goodbye,” Mazaheri said.

Alireza Pey, Ottawa

Alireza Pey

Alireza Pey.

Alireza Pey, known to his friends as Ali, was a loving father who cared deeply for the Iranian community in Ottawa. He leaves behind his two daughters, aged 8 and 10.

“It’s devastating and I’m in disbelief,” said Maryam Kamkar, a friend of Pey’s and Iranian Canadian family community member.

Pey organized a Facebook group to bring Iranian Canadian families together in Ottawa, “to meet and provide an opportunity for kids to play and keep the language and culture going,” Kamkar added.

Pey is also the founder and CEO of MessageHopper, a tech company in Ottawa. Back in 2017, he also published a book called “Discrimination in the Canadian Courts: The True Story of a Muslim Father Fighting for His Children” based on his experience moving to Canada from Iran as an experienced engineer in 2000 and fighting discrimination against immigrant fathers in family court.

“He was a great man who tried to bring the community together,” Kamkar says. “He provided his personal residence as a meeting place for Iranian families to come together, celebrated both Iranian and Canadian holidays with a large group of friends.”

Delaram Dadashnejad, Vancouver

Delaram Dadashnejad.

A student from Tehran studying at Langara College in Vancouver was also killed, Delaram Dadashnejad, 27, was taking university transfer courses at the college.

In a statement Langara College said Dadashnejad was visiting family in Iran and on her way back to Vancouver to continue her studies.

University of Windsor research assistant Hamid Setareh Kokab and wife Samira Bashiri

Samira Bashiri, left, and Hamid Setareh Kokab.

Assistant professor at the University of Windsor Afshin Rahimi confirmed to the Star that his research assistant Hamid Setareh Kokab and his wife, Samira Bashiri, were on the plane.

University of Toronto students and siblings Zeynab Asadi Lari and Mohammed Asadi Lari

UTM student Zeynab Asadi Lari.

Mohammad Asadi Lari.

University of Toronto Mississauga (UTM) student Zeynab Asadi Lari was pursuing a science degree at UTM and was the UTM branch president of the STEM Fellowship, a Canadian non-profit that mentors young scholars in data science and scholarly writing.

STEM Fellowship co-founder Dr. Sacha Noukhovitch confirmed that Asadi Lari, and her brother, Mohammed Asadi Lari, were on the plane that crashed.

Mohammed Asadi Lari, who attends the downtown campus of University of Toronto, co-founded the STEM Fellowship.

The University of British Columbia also confirmed the deaths of the two former students and released a statement expressing their “deepest condolences” to their family and friends. The school said Zeynab had enrolled at UBC in 2016 in the Bachelor of Science program, with a biology major. Her brother graduated in 2018 with a Bachelor of Science in cellular, anatomical and physiological sciences with honours standing.

University of Toronto student Mohammad Amin Jebelli

Mohammad Amin Jebelli.

Mohammad Amin Jebelli, who was completing a Masters of Health Science in the Translational Research Program at the University of Toronto, had travelled to Tehran to be with his family over the holidays.

Joseph Ferenbok, director of the Translational Research Program, said Jebelli had graduated medical school in Iran and worked as a doctor there. After mandatory military service, he chose the program at U of T because he was looking for something “creative and entrepreneurial.”

Jebelli, 29, was an accomplished and bright student. According to his Linkedin profile he had done volunteer work in underserved areas of Iran as a family and emergency care physician, and was interested in medical imaging and cardiovascular diseases.

His “selfless” nature really stood out, Ferenbok said. He said he would always stay late after department events, washing dishes or cleaning up, even when he was commuting from Waterloo during his first semester.

“No matter how much work he had or what he was doing, he always had time to help other people,” Ferenbok said. “He’s touched a lot of lives.”

Kevin Vuong taught Jebelli in a Leadership and Project Management class.

Vuong described him as “a phenomenal scientist” with an interest in cardiovascular diseases, and who had a passion for photography.

“We lost 176 people yesterday, one of them was Amin, and the world is worst for it. May you rest in peace, my friend,” wrote Vuong, who also serves in the Royal Canadian Navy, in a tribute tweet.

Siavash Ghafouri-Azar and Sara Mamani, Montreal

Siavash Ghafouri-Azar and Sara Mamani from Montreal are shown in a handout photo from family friend Gounash Pirniya taken at their wedding in Iran about a week ago.

Two graduates from Concordia University in Montreal were also among the dead. Siavash Ghafouri-Azar and Sara Mamani both graduated from the school of engineering at the university, the school confirmed on Twitter.

Babak Ghafoori Azar confirmed his cousin, Siavash Ghafouri-Azar, 35, worked for aerospace company Pratt & Whitney, in Quebec, after completing his master’s at Concordia. Mamani’s LinkedIn page suggests she’d been employed by Bombardier since 2018.

“It’s a nightmare,” Babak Ghafoori Azar said. “Everyone back home is crying. He was extremely bright.”

After relocating here in 2014, Ghafouri-Azar would go on to meet his future wife, Mamani, at Concordia, Babak Ghafoori Azar said.

“The couple decided to go back to Iran to get married in December, and were on their way home from their festive nuptials when disaster struck,” he said. “They went to Tehran to have the traditional ceremony and celebrate with family.”

Siavash Ghafouri-Azar, a mechanical engineer by trade, sent him pictures from the ceremony and the two exchanged pleasantries about the occasion. That was the last time they communicated.

They were close growing up in Tehran, said Babak Ghafoori Azar, now a journalist in Prague for Radio Free Europe, and although he hadn’t seen his cousin in about 10 years the two stayed in touch with frequent phone calls and social media contact.

Gounash Pirniya, a close friend, said the pair had recently bought a house together.

“They were successful, kind, honest and hardworking people,” Pirniya said. “They were enjoying their life as Canadian citizens.”

Shadi Jamshidi, Toronto

Shadi Jamshidi.

Shadi Jamshidi lived in Toronto and worked at the Mississauga office of Brenntag Canada as a technical sales representative.

The entire community at Brenntag Canada is “devastated” for the loss of Jamshidi, who was the company’s technical sales representative, said HR and communications director Stefania Badea.

Jamshidi, 31, had been working with the company for over a year, and had travelled to Iran to be with her family over the holidays.

“She totally was an amazing person,” said Badea, noting Jamshidi had just been selected to participate in the company’s upcoming global program on leadership in March. “She was a great employee, outstanding, always fun to be around. She had a very positive attitude, highly intelligent. We looked at her as one of our future talents.”

Carleton University student Fareed Arasteh and alumnus Mansour Pourjam

Fareed Arasteh.

Carleton University confirmed two of members of its community were on board the flight: Fareed Arasteh, a PhD student in biology, and biology alumnus Mansour Pourjam.

“Our thoughts are with Fareed’s and Mansour’s families, friends and colleagues at this difficult time, and with everyone who has suffered loss in this terrible tragedy,” the school said in a statement on their website.

Relatives said Arasteh was in Iran to marry his fiancée over the school holiday. Their wedding was just three days ago.

Golnaz Shaverdi, cousin of Arasteh’s wife, said the family is devastated by news of his death, especially his new bride, Maral, who remains in Iran.

“She’s devastated,” Shaverdi said. “He was such a nice guy. Everyone in the family really loved him. He was young and very kind. Everyone is, of course, devastated and they are also very worried for his wife, because she’s going through a very hard time now.”

Shaverdi spent a weekend with Arasteh before he left Canada and helped him pick out his wedding outfit.

“He was a very kind and very honest person. He was thinking about his fiancée, was glad that he was going to go and see her and that they were going to be married,” she said, breaking down into tears. “He talked about all their plans and their dreams about life.”

Bahareh Karami, York Region

Bahareh Karami.

York Region confirmed the death of a member of its staff, Bahareh Karami, who joined the municipality in 2018 working as a technologist in the capital planning and delivery branch within Environmental Services.

“We are so shocked and extremely saddened by this tragedy,” said York Region chairman and CEO Wayne Emmerson in a release. “Our prayers are with Bahareh’s family, friends and colleagues, and for everyone that may be impacted in any way by this horrific event.”

The release said the municipality is in the process of reaching out directly to Bahareh’s immediate family, who live in Tehran. It said she was a graduate of University of Tehran with a Bachelor of Science in chemical engineering, before receiving a master’s degree in science from North Carolina State University.

“Bahareh’s colleagues speak very highly of her,” said York Region chief administrator officer Bruce Macgregor. “She is being remembered for her love of family, a dedicated and strong work ethic, and great sense of enthusiasm.”

Karami lived in Toronto’s Riverside neighbourhood. In her spare time, she enjoyed Latin dancing, especially bachata, a popular social dance style and music genre from the Dominican Republic.

Her dance instructor Fernando Ulloa told the Star’s sister paper she was as a “hard worker with the goal to do better with every practice.”

He’ll “never forget the enormous smile on her face after all of our performances.”

Mahsa Amirliravi and husband Moh Salahi, Toronto

Mahsa Amirliravi and husband, Moh Salahi

Mazyar Amirliravi, the brother of Mahsa Amirliravi, 29, confirmed that his sister was on the flight with her husband Moh Salahi, 30.

“I’m so sad,” a sobbing Mazyar Amirliravi told the Star. Amirliravi said he found out about his sister’s death via news reports. He has since spoken to relatives in Tehran who confirmed she was killed in the crash.

Overwhelmed by grief, Mazyar Amirliravi was unable to speak, so his wife, Nafise Ghadimi, did so on his behalf. She said the couple were both engineers, who

Overwhelmed by grief, Mazyar Amirnavi was unable to speak, so his wife, Nahid Ghadimi, did so on his behalf. She said the couple were both engineers, who met at Ryerson University and later married in 2014. The couple were Canadian citizens, who lived in Richmond Hill and both taught engineering-related courses at Lambton College in Toronto.

“We were supposed to go pick them up today,” she said. “They were very young and successful.”

GTA secondary school student Arad Zarei

Arad Zarei

Arad Zarei, 18, was in Iran visiting his mother over the holidays in the city of Shiraz, according to a statement from his father Mehrzad Zarei, which he released through the office of Willowdale MP Ali Ehsassi.

“He was the apple of my eye and his energetic demeanour and caring personality left a lasting impression on his classmates and many friends,” the father wrote. “His life will undoubtedly leave a gaping hole in the lives of the many he touched.”

Mehrzad Zarei said his son was supposed to come back in Canada to resume his last semester at Richmond Green Secondary School.

École de Technologie Supérieure student Aida Farzaneh and her husband, alumnus Arvin Morattab, Montreal

The École de Technologie Supérieure, a public engineering school in Montreal part of the l’Université du Québec, also confirmed two deaths.

In a release, the school said Aida Farzaneh, a PhD student, who was lecturing in construction engineering, and her husband, Arvin Morattab, who got his PhD there in 2018, were killed in the crash.

“All the ETS community offers its most sincere condolences to the families and loved ones of Ms. Farzanah and Mr. Morattab, as well as to their teachers and colleagues,” the school wrote in a statement.

Razgar Rahimi, Farideh Gholami and their son Jiwan, GTA

Razgar Rahimi, who taught at University of Ontario Institute of Technology in Oshawa and Cetennial College in Toronto, with wife Farideh Gholami and their 3-year-old son Jiwan Rahimi.

Centennial College confirmed Prof. Razgar Rahimi was on the plane that crashed, together with his pregnant wife, Farideh Gholami, and their three-year-old son Jiwan.

Rahimi had started teaching in the department of engineering technology and applied science in September 2018, and was a sessional lecturer at the University of Ontario Institute of Technology in Oshawa.

“Professor Rahimi will be remembered as an engaging teacher and mentor, a friendly face who was always willing to assist students with their assignments, and as a warm human being who spoke often of his young family and his many colleagues and acquaintances both in Canada and back home in Iran,” wrote school president Craig Stephenson.

Friend Mahdiyeh Amiri told the Star that Gholami was an extremely talented and creative artist.

“She got the highest level of the Persian Calligraphy certificate when she was in high school. She got admitted to the university in 2002 for the bachelor degree in Industrial design and from the beginning she exceeded all the teacher’s expectations and graduated with distinction,” said Amiri, adding Gholami went on to work as an interior designer and jewelry designer, and designed yoga pants for ANU that were made from recycled water bottles.

She was dreaming to have her own jewelry design company one day, Amiri said.

“They were a happy family and they were bringing joy wherever they went. It’s a little bit soothing that the last days of their lives were spent in the love of their families,” Amiri said.

Another family friend, Mariana Eret, said the couple were “full of life, energy, plans, and dreams for the future.”

Eret said Razgar wanted to be a professor and that they were very caring and loving parents. Their son Jiwan just turned three last August and Gholami spent a whole month planning his birthday party.

“Jiwan was an extraordinary boy, he was smart, cheerful and he loved reading books. Last Halloween he wanted to be an avocado and Farideh made an avocado costume just for him.”

Eret said Farideh was seven months pregnant with their second son and the whole family were excited about the new addition.

“Farideh has already bought new things and decorated the bedroom for the new baby. They were caring and supportive friends and just fun people to be around. They had many close friends, both in the Iranian and non-Iranian communities,” Eret said. “If you had any question or problem, they were always there for you, ready to help selflessly in any way they could.”

Mohammad Sadeghi, Bahareh Hajesfandiari and Anisa Sadeghi, Winnipeg

Mohammad Sadeghi, Bahareh Hajesfandiari and Anisa Sadeghi.

A Winnipeg family of three will be dearly missed, said their neighbour Behnam Soltani.

Mohammad Sadeghi, who went by Mahdi; his wife Bahareh Hajesfandiari and their daughter Anisa Sadeghi were a kind family, Soltani said.

“They were some of the nicest people I’ve met.”

Soltani said the family was in Iran to visit relatives over the holidays and he knew they were coming back on the flight that crashed.

The family were involved in the local Iranian community, Soltani said. Mahdi Sadeghi was a board member for the Iranian association and Hajesfandiari volunteered at a Persian school.

Soltani was at their home about two weeks before they left. He never expected they wouldn’t return.

“Everybody is in shock. It is so bad.”

Forough Khadem, Winnipeg

Forough Khadem.

Jude Uzonna, the Health Research Chair and an associate professor of immunology at the University of Manitoba, said he was devastated by the death of his friend and colleague Forough Khadem.

He met her at a conference in Iran where she was a translator. At the end of the conference Uzonna told her if she ever wanted to do a doctoral program she could come to his lab in Winnipeg. She took him up on the offer and graduated about three years ago from the University of Manitoba.

Khadem was a talented immunologist and an absolutely fantastic person to be around, Uzonna said.

"If you walk into a room and Forough is there, you will try to find out who is this lady. She is very affable. She connects with people," he said. "It's devastating."

She went home to Iran in December to visit family. He texted her Monday to say he hoped that she was doing well. She responded that she was coming back to Winnipeg and hoped to see him soon.

"Now she's gone," he said.

Amirhossien Ghasemi, Winnipeg

Amirhossien Ghasemi.

Amir Shirzadi, a board member with the Manitoba Iranian Student Association, said his good friend Amirhossien Ghasemi was on the plane.

Shirzadi said his friend was visiting family in Iran and was on his way back to Winnipeg. Ghasemi was a graduate student in biomedical engineering at the University of Manitoba.

"I saw him before he left the country," said Shirzadi, who added that the two played games together.

"I can't use past tense. I think he's coming back. We play again. We talk again. It's too difficult to use past tense, too difficult. No one can believe it."

Another good friend, Shahin Ahmadi, said Ghasemi always wanted to help people and expressed compassion to everyone he encountered. They spoke an hour before the flight and Ghasemi told Ahmadi he was happy to return home and get back to his studies.

"We told each other that we cannot wait to see each other again."

Shekoufeh Choupannejad, Saba Saadat and Sara Saadat, Edmonton

Shekoufeh Choupannejad, left, with her daughters Sara Saadat, middle, and Saba Saadat, right.

Shayesteh Majdnia, a past president of the Iranian Heritage Society of Edmonton, said she was close friends with Shekoufeh Choupannejad, a gynecologist who died along with her two daughters Saba Saadat and Sara Saadat.

Saba was in the midst of her bachelors in the department of biological sciences at the University of Alberta, while Sara had just graduated from the university with a bachelor's degree in psychology, the school confirmed Thursday.

Majdnia said she had spoken to Choupannejad's husband, who is still in Iran, for confirmation. She said Choupannejad also leaves behind a son who was not on the trip with the family.

"She was the kindest person I had ever met," Majdnia said of Choupannejad.

She said Choupannejad was always there for community fundraisers, and often did her best to help take appointments with new immigrants who were overwhelmed and unable to find immediate medical help.

University of Alberta members Mohammad Mahdi Elyasi, Amir Hossein Saeedinia and Elnaz Nabiyi

Mohammad Mahdi Elyasi

Amir Saeedinia

Elnaz Nabiyi.

The University of Alberta confirmed the names of three more members of its community.

Mahdi Elyasi graduated from the university in 2017 with a masters from the Department of Mechanical Engineering and Faculty of Engineering.

According to the university, he was a bright and motivated student who always wanted to be helpful to others and taught English to refugees.

Amir Hossein Saeedinia was supposed to start his PhD student in the same department this month, according to the university. The school said he was known for his big smile, bright mind and enthusiasm for research and discovery.

Elnaz Nabiyi was a phD student in the Department of Accounting, Operations and Information Systems at Alberta School of Business.

The university said she graduated with a master's degree from Sharif University of Technology in Tehran, before moving to Canada to be with her husband a few years ago to begin their PhDs.

University of Toronto student Mojtaba Abbasnezhad

Mojtaba Abbasnezhad

The University of Toronto confirmed Mojtaba Abbasnezhad was among at least six students whose names are on the flight manifest. A LinkedIn profile with that name said he was a PhD student and teaching assistant at the school, and has done research on wastewater treatment.

Abbasnezhad was on the plane because he was returning from visiting his father and brother in Iran, according to his friend, Pooya Poolad.

"It's sad and shocking. I still can't believe he's not here among us. He was only 26 and just started his PhD with many dreams."

According to Poolad, Abbasnezhad had lost his mother a few years ago "and was always missing her. I think now they're together."

Poolad said he'd been thinking of joining his friend on the trip, but then changed his mind. "I wish he (had) never gone there as well. May he rest in peace," he said in a Facebook message.

Saharnaz Haghjoo and her daughter Elsa Jadidi, Scarborough

Saharnaz Haghjoo and her daughter Elsa Jadidi

A photo of Pedram Jadidi, seen at a memorial at the University of Windsor.

Al Haadi School, a private elementary establishment in Scarborough, posted on its Facebook page on Wednesday afternoon that its Grade 3 student Elsa Jadidi was on the plane that crashed, along with her mother. Describing her as a bright and brilliant student, the school said her passing will leave "a gaping hole" in people's hearts.

"She was a kind, compassionate soul who lit up our classrooms, and held so much promise as a stellar student and impeccable leader at such a young age," the school statement reads in part.

"Our school will be much dimmer without Elsa to warm the hallways with her smile and laughter."

Her mother, Saharnaz Haghjoo, was the manager of the Jump Scarborough program at the YWCA. The Jump program is designed to help resettle newcomers to the city.

Elsa had gone to school at Wali ul Asr in Brampton up until last year. A Facebook post from Wali ul Asr called Elsa a "wonderful girl who was always smiling."

Haghjoo's sister is one of Wali ul Asr's central campus teachers. The school called Haghjoo "a great supporter of the school," always making a point to "express her gratitude and appreciation to Elsa's teachers."

High school student Arshia Arbabbahrami and engineer Kasra Saati, Calgary

Kasra Saati

The Calgary Board of Education has confirmed that Arshia Arbabbahrami was an international student in Grade 12 at Western Canada School who was returning to Canada after spending the holidays with his family in Iran.

Principal Carma Cornea sent an email to students and families Wednesday that said Arbabbahrami was active in track, and the swim and dive teams: "He dreamt of being a doctor and was a leader in our community who many students looked up to."

Wednesday evening Calgary Mayor Naheed Nenshi tweeted his condolences to Arbabbahrami's family, as well as a second Calgarian killed in the crash. Kasra Saati was on the passenger list of the doomed flight.

"Our hearts are heavy as we grieve the loss across the country and in our city with Arshia and Kasra's families," he said.

Engineer Kasra Saati, listed as a passenger by the airline, was also believed to have been on the flight, according to a statement from his former employer, Viking Air.

In an emailed statement, a company spokesperson said he'd been a valued member of the team at the Calgary aircraft assembly facility up until last month. "His loss is deeply felt by everyone who had the opportunity to work with him," the statement read.

Saati travelled to Iran over the holidays for a reunion with his wife and two children, said friend Nina Saeidpour.

"He was such a smart, social person and of course he was a family guy."

Saeidpour said Saati boarded the plane to return to Calgary, while his wife, Mehsam, infant daughter and son, who is 10 or 11, stayed behind. Mehsam was in Iran during her maternity leave so that her family could help out with the new baby, Saeidpour said.

She said friends frantically went through the flight manifest when they got word of the crash. Saati's name was on it, but not the rest of his family. Eventually Saeidpour was able to connect with Mehsam, who was in shock and surrounded by friends and family.

"It's just so sad that people come here to have a better life for themselves and their families, and then something like this happens," said Saeidpour. "Suddenly, they leave behind a beautiful young family."

Angela Murray, a spokeswoman for Viking Air Ltd. said Saati worked at the company's aircraft assembly facility from early 2018 until December 2019. His LinkedIn profile says he was a quality engineer.

"His loss is deeply felt by everyone who had the opportunity to work with him," said Murray.

Ajax family Hiva Molani, Evin Arsalani and daughter Kurdia Molani

Hiva Molani, left, and Evin Arsalani

Kurdia Molani with her mother Evin Arsalani.

A young family of three from Ajax were also killed in the crash. Evin Arsalani, 30, her husband Hiva Molani, 38, and their one-year-old daughter Kurdia were all passengers on the flight that crashed. They were returning to Canada after spending three weeks in Iran to attend a wedding, according to friend Nasrin Alizadeh.

"We are all shocked and in disbelief. It was Evin's birthday on Jan. 2, and she had just turned 30," said Alizadeh in an emailed statement. "Evin's mother is currently in the hospital with the rest of her family as her mother became ill after hearing the tragic news.

"They are a well respected and well known family here among the Kurdish Iranian community. May they rest in peace."

"I've directed staff to lower our flags to half-mast and to offer our condolences," said Ajax mayor Shaun Collier in response to the deaths of the family. "It's a tragic loss. Our thoughts and prayers are with the family, I can't imagine what they're going through."

Fatemeh Kazerani and Mohammadhosse Saket, North Vancouver

Fatemeh Kazerani and Mohammadhosse Saket

A young couple from North Vancouver, Fatemeh (Faye) Kazerani and Mohammadhosse (Daniel) Saket, were confirmed to have been on the flight. Sima Ghaffarzadeh, editor of Farsi-language Hamyaari media, told the Star a relative had identified the pair.

Daniel worked at North Vancouver-based real-estate developer Denna Homes, the company confirmed.

"This has been a very trying day for the Denna Homes family. As a small office of 10 people, Daniel's passing is a significant loss to all of us. Daniel was a colleague, a friend and family. Both he and Faye will be sadly missed," Dan Thomson, vice-president of marketing, said in a statement.

"Daniel and Faye both had a zest for life that lit up every room they entered."

Farzad Taheri said he saw his cousins, who went by the English names Daniel and Faye, just before Christmas.

"We were the only family they had in Canada," Taheri said.

Taheri described Saket as "extremely kind, generous, humble genius."

His death is a "big loss to humanity," he said.

"Faye was the most positive, also extremely kind and generous woman."

Ayeshe Pourghaderi and daughter Fatemeh Pasavand, North Vancouver

Residents of North Vancouver identified Ayeshe Pourghaderi, 37, and Fatemeh Pasavand, 18, as mother and daughter. Pourghaderi and her husband opened Amir Bakery two years ago, according to Reza Varasteh, the manager of a shop and deli across the street.

The mother and daughter had been in Tehran visiting family and friends, according to Arash Azrahimi, owner of a photography business near the baker. The couple worked seven days a week and Pourghaderi did many of the bread deliveries to retailers herself, said Varasteh.

"I saw her two weeks ago," he said. "She always had a smile on her face."

According to Varasteh, Pourghaderi's husband got on a flight back to Tehran as soon as he found out about the crash.

Firouzeh Madani and husband Naser Pourshabanoshibi, Metro Vancouver

Firouzeh Madani and her husband, Naser Pourshabanoshibi, were both doctors who had moved to Canada about six years ago to upgrade their educations said, family friend Majid Mahichi.

He said he'd known Pourshabanoshibi since they were in high school growing up in northern Iran. "He was one of the top students," Mahichi said. "We were all waiting to see him be really successful."

Mahichi said when he looked at the flight manifest he saw the names of his two friends, then later confirmed the news with Madani's sister.

A North Vancouver couple in their mid-50s, Madani and Pourshaban were both award-winning physicians in Iran, said their niece Sara Hezarkhani. They were working towards getting their licences to practise in Canada.

"No words can describe their personalities, their true spirit, the passion that they had for the work," Hezarkhani said.

The couple was in Iran for about two weeks over the holidays to visit family, she said.

Pourshaban and Madani had been living in Canada for about seven years, Hezarkhani said. Their daughter is a university student in the Lower Mainland. She was not on board the flight.

"This is a big loss for our family and it will be very hard to (get) over," said Hezarkhani.

Asghar Dhirani, Caledon

Asghar Dhirani was remembered for his "vivacious personality on the golf course." He was a religious leader and supporter of the non-profit Wali ul Asr school in Caledon, close friend Shaiq Ibrahim said. He would lead pilgrimages back to various religious sites in Iraq and Iran with the community.

"He was extremely helpful, kind, and polite," the Wali ul Asr school wrote in a Facebook post. "He often told the school's management 'Please to not hesitate to ask, I will help the school in any way I can, whatever little I can do.'"

Western University students Milad Nahavandi, Hadis Hayatdavoudi, Ghazal Nourian and Sajedeh Saraeian

Milad Nahavandi.

Hadis Hayatdavoudi was a PhD student at Western University.

Ghazal Nourian

Sajedeh Saraeian, left.

In London, Ont., the University of Western Ontario held a Wednesday night vigil for four graduate students who lost their lives in the plane crash:

Milad Nahavandi, a PhD candidate in Chemical and Biochemical Engineering, Hadis Hayatdavoudi, a PhD candidate in Chemistry and Sajedeh Saraeian, an incoming Masters student in Chemical and Biochemical Engineering, and Ghazal Nourian, a PhD candidate in Mechanical and Materials Engineering.

University president Alan Shepard called the deaths "devastating."

"It's just heartbreaking and difficult to comprehend," Shepard told the Western News. According to the university's paper, all four were international students.

Hayatdavoudi was studying the effects of hydrogen on copper at the Electrochemistry and Corrosion Science Centre. Its goal is to examine how corrosion

affects nuclear waste containers. Her supervisor, Jamie Noel, said Hayatdavoudi had spent a month in Iran with her family — her first time back home since she moved to Canada on her own in September 2018. He said she was on the flight so she could be back in Canada in time to act as a teaching assistant for one of his courses.

“She found Canadians were very welcoming to her, coming from so far away, all by herself, a single woman in a strange country, with a different language,” said Noel, who noted that she quickly found community with other Persian students in his lab.

University of Ottawa students Alma Oladi, Mehraban Badiei, and Saeed Kashani

Alma Oladi.

Saeed K. Kashani .

At the University of Ottawa, a professor of international affairs shared his condolences in a Twitter post for three students, Alma Oladi, Mehraban Badiei and Saeed Kashani, who died in the crash.

“Deepest condolences to the families of three uOttawa students… and to all the other grieving families,” Roland Paris posted.

The university school paper featured Badiei, a first-year health sciences student who said her goals for 2020 were to meet new people and make new friends.

“Since the publication of this article on Tuesday, January 7, 2020, we were saddened to learn that Mehraban was a victim in the tragic Flight PS752 accident in Iran. We offer our sympathy and condolences to her family and friends,” the updated article read.

Saeed K. Kashani was entering the fourth year of his chemistry PhD degree, said Stephen G. Newman, an associate professor in the department of chemistry and biomolecular sciences. His focus was on organic synthetic: the branch of chemistry that deals with how to construct complex, valuable molecules from commercially available chemical building blocks.

Alma Oladi was a PhD student studying mathematics at the University of Ottawa. Students and staff who knew her turned her desk into a makeshift memorial on Wednesday, with white flowers and cards placed next to a picture of her signature smile.

“She always had this smile on her face,” said Mohsen Zandimoghadam, who was a friend of Oladi.

“She was a nice and kind girl. She always wanted to explore places and discover new things in life and new places … she had so many plans for her life in Canada.”

Saint Mary’s University students Maryam Malek and Fatemeh Mahmoodi

The Saint Mary’s University Students’ Association in Halifax expressed their condolences late Wednesday night for the loss of two students, Maryam Malek and Fatemeh Mahmoodi, who were studying for a master’s degree in finance.

“We would like to express our thoughts to the families, friends, and colleagues,” the association wrote in a statement.

“I knew them very well,” said Colin Dodds, the program’s academic director and the university’s former president, who noted he had taught them in November and December and had stayed in touch with the pair during the holiday break.

The intense, 12-month program is aimed at helping students establish a career in the financial services sector.

“To celebrate the fact that it was the end of the first semester ... they were going home to see parents and family,” Dodds said. “It’s a huge loss.”

Malek was in her early 40s and Mahmoodi was in her early 30s. Both spoke three languages.

University of Victoria student Roja Omidbakhsh

Roja Omidbaksh

The University of Victoria confirmed that Roja Omidbakhsh, a first-year student, died in the plane crash.

“It is always a profound loss for the entire community when we lose someone, and our hearts and thoughts go out to Roja’s loved ones,” University president Jamie Cassels wrote in a statement Wednesday.

Omidbakhsh was a “very positive” student, professor Mark Colgate said.

“She was on the pathway to complete a bachelor of commerce ... we’re heartbroken that this happened and our condolences go to her family and classmates.”

University of Toronto students Mohammad Amin Beiruti and Mohammad Salehe

Mohammad Amin Beiruti.

Mohammad Salehe.

The University of Toronto confirmed that two more of its students were killed in the crash in a Wednesday press release: Mohammad Amin Beiruti and Mohammad Salehe.

“On behalf of the entire University of Toronto community, I want to say how deeply saddened we are, and how concerned we are for the families and friends of those who lost their lives,” U of T president Meric Gertler said in a statement. “We are continuing to gather information, and taking care to respect the privacy and wishes of all involved.”

Salehe was a PhD student in computer science. He was relatively new to Canada, having moved to Toronto about a year and half ago. Friends told UofT News that Salehe had exceptional talent and was a very skilled programmer.

Fellow PhD student Seyed Hossein Mortazavi described Salehe as a “remarkable” human being who was always eager to help others. “I don’t know anyone that has ever said any bad thing about him and I’ve known him for 22 years,” he said of Salehe.

Mohammad Amin Beiruti was pursuing a PhD in computer science. At a campus memorial, his professor Yashar Ganjali told mourners that Beiruti was

working on a project to design controllers for next-generation internet. He was someone who "wanted to make the world a better place," Ganjali said, according to UofT News.

Amir Ovaysi, Asal Ovaysi and Sara Hamzeei, GTA

Amir Ovaysi and his daughter Asal.

Amir Ovaysi and his wife Sara Hamzeei.

Amir Ovaysi, 42, is remembered as a proud family man who would often show his colleagues videos and photos of his six-year-old daughter, Asal, and his wife, Sara Hamzeei, 34.

His manager, Troy Futher, says the three were in Iran to visit Ovaysi's aging parents. Ovaysi left in mid-December, joining his wife and daughter, who had arrived in November. It was their first visit home since they came to Canada about two years ago.

Futher said he hired Ovaysi at his heating, ventilation and air-conditioning company, Smith Energy Inc., in June. Ovaysi had a master's degree in mechanical engineering. He worked out of the company's Mississauga, Ont., office, but had a house in Newmarket, Ont.

"He was genuine. He was a super person — a brilliant mind, an astute student," said Futher, who added it was heartbreaking to have to inform staff that Ovaysi and his family were on board the flight.

"A lot of the employees took it extremely hard," he said. "It's been a sombre day, a very difficult day."

Nasim Rahmanifar, Edmonton

Nasim Rahmanifar was a master's student in the University of Alberta's mechanical engineering department.

Nasim Rahmanifar, a master's student in the University of Alberta's mechanical engineering department, was nervous about her first winter in Edmonton.

"She was so excited to go back ... she planned to surprise her mom," her friend Sina Esfandiarpour told Edmonton media at a news conference.

He said he received a text from Rahmanifar from the airport that she was on her way back and she wasn't looking forward to the cold weather.

"She was afraid," said Esfandiarpour. "She just came in May and she said, 'They told me it was just freezing cold.'

"She is never going to see that."

Ramin Fathian, Rahmanifar's officemate, said she was really worried about the weather in Edmonton.

"She was asking me all the time, 'What is the best jacket?'" he recalled. "We were saying it's not that bad. You will get used to it."

One of her supervisors, Prof. Hossein Rouhani, said Rahmanifar was a highly motivated, hard-working student who had recently earned a scholarship.

"She was an outstanding student," said Rouhani, who added Rahmanifar planned to complete a PhD when she returned to Canada.

Roja Azadian, Ottawa

Roja Azadian was supposed to travel to Canada for the first time with her husband, who has been studying at Algonquin College in Ottawa, but a mix-up over his ticket meant he could not get on the plane with her.

"He was thinking, I'm going to send her and then I'm going to be back on the next flight," said Leila Hojabri, a friend of Azadian's husband.

He called a friend in Ottawa, asking if he could pick Azadian up at the airport and ensure she was safe. Instead, her husband remains safe in Iran and she died aboard Ukraine International Airlines flight PS 752.

"She wasn't sure if she should come to Canada and he was just building here and getting ready for her to join him and it's just a really, really tragic story," Hojabri said.

Dalhousie student Masoumeh Ghavi and sister Mandieh Ghavi

Masoumeh Ghavi, a master's student at Dalhousie in IT and communications, and her younger sister Mahdieh, a first-year student, were flying back to Halifax to resume their studies.

Sadra Kord-Jamshidi, president of the Dalhousie Iranian Students Society (DISS), said that Masoumeh had just recently come to Halifax.

"I met her last October at an annual general meeting that we held for the DISS. She came here in September. She was the nicest and also a very hard-working individual. Being a self-funded master's students working two jobs to make ends meet, she also offered the society her help in all of our events," Kord-Jamshidi told the Star.

A Tehran native, Masoumeh had been working at MTN Irancell and Huawei previously, according to her Facebook profile.

Dalhousie's Iranian Students Society put out a statement on Wednesday, writing that "we are deeply saddened by the tragic crash of flight #PS752 that was headed from Tehran to Kyiv and took away our beautiful Masoumeh and many other brilliant minds." The group has organized a vigil, which is taking place on Jan. 11.

Terry Balser, Dalhousie's provost and vice-president academic, said on Wednesday in a news release that "on behalf of the entire Dalhousie University community, I wish to offer my deepest condolences to all impacted by this tragedy, including those on our campuses and in the broader Iranian community in our region. We are here for you and thinking of you in this difficult time."

Sheyda Shadkhoo, Markham

Sheyda Shadkhoo.

Shadkhoo, 41, was a chemist who worked as a control substance co-ordinator at SGS Corp. in Markham, Ont., a Swiss company that helps inspect, test and verify that products on the market meet various government standards.

Her husband, Hassan Shadkhoo, said his wife phoned him Wednesday, just before the plane took off, because she was afraid to fly. The conflict between Iran

Her husband, Hassan Shaukhoo, said his wife phoned him Wednesday, just before the plane took off, because she was afraid to fly. The conflict between Iran and the United States and the missile attacks had alarmed her.

He said he is gutted that he reassured his wife it would be OK. Twenty minutes after they got off the phone, the plane crashed.

"I wasn't there," he said, sobbing. "I should have been there with her."

The couple was married for 10 years. Sheyda was in Iran to visit her mother.

University of British Columbia fellow Mehran Abtahi, Vancouver

Mehran Abtahi

On Wednesday, the University of British Columbia confirmed that Dr. Mehran Abtahi, a postdoctoral research fellow studying civil engineering died in the flight.

He was among three UBC alumni, Niloofar Razzaghi, Zeynab Asadi Lari, and Mohammad Asadi Lari.

"I wish to once again, on behalf of the university, express my deepest condolences to the families, friends and loved ones of our community members," Santa J. Ono, university president, wrote in a statement.

Shakiba Feghahati and Rosstin Moghaddam, GTA

Shahin (Shawn) Moghaddam, Shakiba Feghahati and Rosstin Moghaddam, 10.

Shakiba Feghahati and her son, Rosstin Moghaddam, 10, didn't make it back home to Nobleton after visiting family in Iran, Feghahati's husband, Shahin (Shawn) Moghaddam, said.

"Please give them back to me," Moghaddam pleaded through tears, his voice trembling.

He said Feghahati helped him at their metal fabricating business in Woodbridge and took care of Rosstin.

Rosstin, their only child, was a Grade 4 French immersion student at Beynon Fields Public School in Richmond Hill.

The family moved to Canada seven years ago, according to one of Feghahati's posts on Instagram.

"We didn't hear good news from Iran in the last few days. It's completely broken my heart…" Feghahati wrote in a post in Persian Nov. 19. "Today we witnessed the selfishness of human beings … Our change and revolution can begin here."

Behnaz Ebrahimi-Khoei and her son Rahmtin Ahmadi, Toronto

Behnaz Ebrahimi-Khoei, a property valuation analyst in Toronto, died in the crash, the Ontario Public Service Employees Union confirmed.

"Behraz was a member and steward with Local 552. She will be dearly missed," the union wrote in a statement.

According to the union group, she was one exam away from completing her Canadian Residential Appraiser (CRA) designation.

Ebrahimi-Khoei is remembered as a kind-hearted person and a dedicated mother, according to co-workers. Her son, Rahmtin Ahmadi, a Grade 4 student in the Toronto District School Board, was also killed in the crash.

The TDSB sent out letters to notifying the Muirhead Public School community that Ahmadi, was killed. The note called Ahmadi an "energetic and enthusiastic young man," who loved to play tag and was known to "greet staff and students each morning with a friendly hello."

Amihossein Ghorbani Bahabadi, Winnipeg

Amirhossein Bahabadi Ghorbani.

The University of Manitoba has identified Amirhossein Ghorbani Bahabadi, a current student with the International College of Manitoba, as one of the victims from the crash in a statement from Wednesday morning.

He is one of five alumni and students from the University of Manitoba to be named.

During a vigil at the university his close friend Ayda Mohammadian said Ghorbani wanted to be a doctor. Ghorbani studied very hard but was also a lot of fun, his friend said. Ghorbani's goal was always to become successful so he could take care of his parents back in Iran, she added.

"We never knew that on the way back here he was going to die, and we are the ones who lost him," she said holding back tears.

Before Ghorbani went back to Iran in December, Mohammadian told her friend she was worried for him. Ghorbani told her that he would return in 20 days and they could get back to planning their futures.

"But he didn't come back," she said.

University of Windsor members Pedram Jadidi and Mohammad Abaspour Ghadi

Two more people with ties to the University of Windsor, Pedram Jadidi and Mohammad Abaspour Ghadi, have been identified as victims from the plane crash.

Jadidi was a doctoral student of civil engineering and Ghadi, the spouse of Zahra Naghibi, who was also a doctoral student of civil engineering at the school. A total of five people have been identified by the school.

"This is a real tragedy for our institution," said University of Windsor president Robert Gordon. "These were five extraordinary individuals who embodied what our University is all about."

Jadidi was in Iran to mark the first anniversary of his father's death, his friend Mehran Eshaghi told a memorial service.

He had moved to Canada to study civil engineering at the University of Windsor shortly after his dad died and he went home to be with his family.

"Who would have thought this was going to be his last farewell to his mother?" Eshaghi asked. "Who would believe this beautiful family would lose a father

and son in a year?"

Eshaghi said his friend was a strong student and more.

"He demonstrated to be an exceptional, enthusiastic researcher," he said. "Outside of work space, Pedram was known by all of us as an approachable friend. He was a keen lover of movies, music and sport and was a skilled graphic designer."

Jadidi's PhD supervisor Shaohong Cheng said Jadidi was a promising young scientist.

"He brought all his passion, his expertise, to my group, to my lab," Cheng said, recounting how Jadidi and a colleague had created a wind tunnel experiment.

"I still remember that moment when Pedram and his partner came to my office and proudly showed me the video of that test," she said. "We were so excited. We cheered together for this milestone in my research group."

Zahra Naghibi, Windsor

Zahra Naghibi

Zahra Naghibi was a PhD student and colleague of Jacqueline Stagner at the University of Windsor. Stagner said she was informed by the head of the lab where Naghibi worked that she was on the plane.

"She was very helpful and warm," Stagner said.

Naghibi was a part of Windsor's Turbulence and Energy Lab, where she worked on issues related to solar energy.

Stagner said when one of her students — just starting graduate work and new to Canada — needed help, Naghibi stepped in.

"Zahra was giving her advice, helping her out, letting her learn from her own work and what she'd discovered — helping her along, the next generation of researchers. She was very welcoming."

Shahab Raana and Sahand Hatefi-Mostaghim, Montreal

Shahab Raana and Sahand Hatefi-Mostaghim

Two students at the Avrion Technical Institute in Montreal have been identified as victims in the crash. Shahab Raana and Sahand Hatefi-Mostaghim were "not just one, but two of my best and most valuable students," their teacher Mike Stephens wrote in a Facebook post.

"Shahab and Sahand were incredibly talented, smart, hard working and goal oriented," Stephens added. "They were both eager to learn as much as they could as well as wanted to."

A fellow classmate in their welding and fitting class, Dong Wong Lee, from South Korea, became really close friends with Raana and Hatefi-Mostaghim, despite language barriers.

"All of our classmates are really close each other. We shared lots of different things such as culture, language, experience and we enjoy to talk about it a lot," he told the Star. "Even though it wasn't a long time, we were all like brothers. We are in a deep sad mood."

Queen's University student Amir Moradi

Queen's University is mourning the loss of a student, Amir Moradi, who died in the plane crash. Moradi was enrolled in the Faculty of Arts and Science, according to a statement shared by the university.

"Having just received new information, it is with great sadness that I must now convey that one of our undergraduate students has perished in the plane crash tragedy in Iran. That tragedy, which has touched so many of our higher education institutions in Canada, has now affected Queen's directly," school principal Patrick Deane said.

Farzaneh Naderi and 11-year-old son Noojan Sadr, Winnipeg

Farzaneh Naderi and her 11-year-old son, Noojan Sadr, from Winnipeg have been identified as victims. A GoFundMe page has been organized Sadr's cousin Negysa Kalar.

"Farzaneh was an amazing mother, wife, aunt, and incredible person. My cousin Noojan was charismatic, caring, and beyond his years. Too young to have lost such a beautiful soul," the post from the family read.

"She loved her family so much and would do anything for us," Kalar said of Naderi. "She was so full of life and selfless."

The family moved to Winnipeg about 15 years ago. Naderi volunteered for three years before being permanently employed as a tutor for children with autism at St. Amant, a not-for-profit foundation in Manitoba.

A statement from St. Amant said Naderi had a big heart and genuinely cared about her colleagues, the children and their families.

Noojan loved to play video games and soccer. He adored his family, his cousin said.

"My little cousin was the sweetest boy and so humble."

The mother and son were on their way home to Winnipeg after visiting family in Iran. Kalar has started the Sadr Family Memorial Fund to support her uncle, Abolfazl Sadr, who lost his son and wife.

Soheila Massoumeh Moshref Ravazi Moghaddam, West Vancouver

Family friend Majid Majid Mahichi has confirmed West Vancouver resident Soheila Massoumeh Moshref Ravazi Moghaddam was aboard the plane.

Mahichi said the mother of three worked as an office manager at a local hotel.

Fereshteh Maleki Dizaje, Ottawa

Dizaje, a 47-year-old Ottawa architect, was travelling back from Iran after attending the wedding of her only daughter.

Her longtime friend Reza Eslami, who first met her at the architectural school in Tehran, described her as a “brilliant architect” and “amazing friend.”

“She had no problem picking up construction tools and building things with her own hands,” he said.

A single mom who had moved to Canada a few years ago, she was looking forward to focusing a bit more on her own life, now that her daughter was married.

“She always had this smile, no matter what state of mind she was in,” Eslami added.

Mohammad Moeini, Sherbrooke, Que.

Mohammad Moeini

Mohammad Moeini, a resident of Sherbrooke, Que., has been identified as a victim of the plane crash.

According to his LinkedIn page, Moeini worked as a Mechanical Designer at Bombardier Recreational Products.

Sherbrooke Mayor Steve Lussier shared his condolences in a Facebook post.

Sharieh Faghihi, Halifax

Sharieh Faghihi

Dalhousie University released a statement Thursday confirming Dr. Sharieh Faghihi was killed in the crash.

Born in Tehran, Faghihi immigrated to Canada in 2011 with her husband and two children. After graduating from Dalhousie in 2016, she returned to the faculty to teach in the Division of Periodontology in 2017 and also worked in private practice in Halifax. According to an alumni magazine, she also helped establish a dental centre for disabled children in need in Tehran.

Faghihi was an “absolute joy,” said LJ Turnbull, regional manager for Dentalcorp.

“One of the kindest human beings,” said Turnbull. “She had a fantastic sense of humour and she was great with the patients ... She was friends with everybody on the team.”

Another colleague, dentist Ebrahim Kiani, said he first met Faghihi 25 years ago when she was head of the periodontics department at the Shiraz University of Medical Science in Iran.

“She was very kind, very generous with her knowledge and very skilled,” Kiani said. “She was published in many journals ... She was a good mentor for me.”

Dawn Collins told the Star she was a patient of hers.

She paid tribute to her “maternal presence” in a Facebook post, saying she made her feel more comfortable in the dentist chair.

“I always felt she was very loving in her work and nurturing,” said Dawn Collins. “Appreciate her.”

Farhad Niknam, Toronto

Farhad Niknam.

Dr. Farhad Niknam, a dentist in Toronto, has been identified by the Iranian Ontario Dental Association as a victim of the crash.

In a Facebook post from Wednesday, the organization named Niknam along with two other dentists in Ontario.

“May they rest in peace.....I would like to extend my most heartfelt condolences to their families and loved ones,” Reza Termei, the IODA president, said.

Niknam, 44, moved to Winnipeg five years ago with his wife and daughter after running a dental practice in Iran for 15 years, said Sanaz Valadi, his friend of 20 years.

About three years ago, after having a son, the family moved to Toronto. Niknam took his dental equivalency exam and began to train other foreign dentists.

He had recently settled the family in a new condominium and registered to be a dentist in Toronto.

Valadi said they spoke on the phone only three days ago and Niknam was excited to come back to Canada to start a new phase of his career. Instead, Valadi spent the hours after the crash with Niknam’s grieving wife.

Niknam and his wife, Mojgan, had been married for 15 years. Valadi said she will never forget how much they glowed as they danced at their wedding.

Now Mojgan is alone with her daughter Yana, 7, and son Yuna, 3.

Niknam’s family flew back to Iran on Wednesday to have DNA tests done so they can retrieve his body.

Niloufar Sadr, Montreal

Niloufar Sadr

Niloufar Sadr, a mother, artist, and community member in Montreal’s art scene, was killed in the plane crash, the MEKIC art gallery shared on social media.

Sadr was a “beloved friend” and “helped lots of artists and artisans” when she worked at gallery. “So many memories and its still so hard to believe this tragedy. God bless her soul,” the post read.

The MEKIC gallery represents the Iranian and Middle Eastern artist community.

Sadr, 61, was returning to Toronto after a visit with family in Iran.

Sadr had lived in Montreal for many years but moved to Toronto a few years ago to be closer to her adult children and grandchildren, said Elahe Machouf, a longtime friend.

She described Sadr as someone who was full of life and had managed an art gallery in Montreal.

“She was very involved in the cultural field,” Machouf said. “Recently, she moved to Toronto because her children had moved there and she followed them, as

"She was very involved in the cultural field," Machouf said. "Recently, she moved to Toronto because her children had moved there and she followed them, as many mothers do."

Machouf said Sadr's father was Ahmad Sayyed Javadi, a prominent Iranian lawyer, politician and political activist, who died in 2013.

Sadr's ex-husband Reza Banisadre, a Montreal architect, said Sadr visited Iran every year.

"She was very joyous. She had lots of friends," Banisadre said. "She loved life."

Sadr leaves two daughters and a son, as well as three grandchildren.

Faraz Falsafi, Toronto

Faraz Falsafi

Faraz Falsafi, a Toronto software engineer, had been visiting family in his hometown of Tehran over the holidays. A friend of his and fellow engineer, Arian Hosseinzadeh, said Falsafi was a scholar who completed a bachelor's degree in software engineering and master's degree in the science in intelligent systems at Kabir University of Technology, and a master's in machine learning at McGill University.

It was there, at McGill in Montreal, that Hosseinzadeh said he and Falsafi met.

"He was fun, he was humble, and he was very smart and talented," Hosseinzadeh wrote in an email to the Star. "Not only his family and friends, but I'm sure the world is going to miss such a good person."

Hamidreza (Sam) Djavadi and son Kian Djavadi, Missisauga

Hamidreza (Sam) Djavadi

Kian Djavadi

Hamidreza (Sam) Djavadi and his teenage son Kian were returning to Canada from a holiday trip to Iran. His wife had caught an earlier flight back so she could return to work.

They lived in Mississauga but had a cottage in Grand Bend, Ont. That small community is now mourning them, remembering them both as "just really friendly, truly kind souls," said Michael Vanhevel in a message to the Star.

Vanhevel, who worked at the marina in Grand Bend, said the father and son could often be seen out on their boat and would stop to chat as they filled it up with gas.

"We remember them vividly, and everyone who worked there, including me, loved to see them coming down the channel," he said.

Juan Castro, hired Kian to work for him last summer, at his Grand Bend water sports rental company.

The teen "pretty much made the whole summer" quickly becoming a key member of the team who would often invite other employees back to his parents' cottage for dinners. "He was such a good kid," Castro said. Sam, as he was known, was always one of the first ones out on his boat each season and "pretty much made friends with everybody."

George Brown students Kiana Ghasemi and Darya Toghian, Toronto

Kiana Ghasemi

Kiana Ghasemi was on her way to begin studies at George Brown College, family friend Mohammad Rastifar confirmed in a message to the Star.

"God bless her," he said. Family friend Samira Akbari added Ghasemi was "really excited" about this new chapter in Canada.

"Her dad had tried so hard to send her over there," she said over the phone from San Francisco. "It's so sad."

Darya Toghian was studying at George Brown College and was also killed in the crash.

The college did not release the names of the two students killed in the crash, but said one was studying in the Architectural Technology program and the other in the Computer Programmer Analyst program.

"The shock and sorrow felt across Canada right now feels particularly heightened for us with the tragic deaths of two of our students. To those of you who studied and worked with the students we lost this week, I extend my deepest sympathies," George Brown College President Anne Sado said.

"We share this grief and profound sense of loss with our colleagues across the post-secondary education community, who are also mourning the deaths of their co-workers and students — individuals who were preparing to take on the challenges of a new semester and were working towards bright futures. Honouring the memories of those who died may ease some of the anguish we're all feeling."

Mahmoud Attar, GTA

Mahmoud Attar

Zohreh Attar was beside herself with worry, knowing her brother Mahmoud, 69, was about to board a plane to fly from Iran to Canada just as the area was brewing with war.

"I didn't want to upset him, but I was so afraid. I texted him, told him to be careful."

But he shrugged off her worries and instead texted back, asking what he could do for her, what did she need that he could buy in the airport and bring to Richmond Hill?

It was typically selfless Mahmoud, Zohreh said, always thinking about others, never himself.

He had been excited to help his 35-year-old daughter, Sahar Attar, decorate her new North York home. He was bringing her treasured items, dinnerware and photos from Iran, to make it her own.

"Before he left," Sahar said, "he said 'don't worry, I have wrapped them very carefully so they won't be broken on the way.'"

These were the last messages Zohreh and Sahar received from Mahmoud.

Zohreh, a resident of Richmond Hill since 2007, said Mahmoud loved Canada; Sahar smiled, remembering how delighted he always was to hear Canadian border officials say, “welcome to Canada.”

Zahra Hasani, Toronto

Zahra Hasani was the wife of student Mohammad Salehe, who was also on board the plane.

They made a great couple, said longtime friend Seyed Hossein Mortazavi.

Salehe was a talented scientist who grew up with a love of computer programming, while Hasani wanted to do her master’s at the University of Toronto.

After completing two degrees from Sharif University of Technology in Tehran, Iran, and working as a senior software engineer at a tech company, Salehe started his PhD in computer science at the University of Toronto, Mortazavi said.

“Although he was usually quiet, he was very active in multiple social and religious communities, always trying to be there for his friends and neighbours,” said Mortazavi.

“Zahra was caring, devoted to her friends and family,” he said.

The two were on their way back from visiting family in Iran after the last school term.

Masoud Shaterpour Khiaban, GTA

Masoud Shaterpour Khiaban

The young man was about to begin his studies at York University’s school of continuing studies, York confirmed.

He was supposed to be doing a post-graduate certificate in the business administration program.

“We are heartbroken by this news,” said president and vice-chancellor Rhonda L. Lenton in a statement.

“On behalf of the York community, we extend our heartfelt condolences to everyone affected by this tragedy.”

Niloofar Rastgar spoke to his father’s cousin, Shaterpour over text in the months prior to the fall of Ukraine Airlines 752. They spoke about Shaterpour moving to Canada and beginning his new life at York University to earn his MBA. Rastgar, who said he may have only met Shaterpour once or twice as a little kid, said Shaterpour had made quite the impression through the short, brief text messages.

“I could tell that he was a hard working, well-educated and kind person,” Rastgar said, noting that Shaterpour, 31, had a medical degree from a university in Iran. “He was a self made person.”

Rastgar, who lives in Vancouver, said Shaterpour’s mother passed away when he was a teenager and his father had died about four months ago.

“He had two brothers and two sisters who are in shock and mourning for him.”

Shahrokh Eghbali Bazoft, Maryam Agha Miri and Shahzad Eghbali Bazoft

Shahrokh Eghbali Bazoft (left), Maryam Agha Miri and eight-year-old Shahzad Eghbali Bazoft

Shahrokh Eghbali Bazoft, his wife Maryam Agha Miri and their eight-year-old daughter Shahzad Eghbali Bazoft lived in Toronto and all died together, said Sharokh’s niece, Nadia Eghbali.

Eghbali said her uncle was a kind soul and a charismatic person.

“It was really hard not to like him because he was so kind. He had the best stories with funny voices and expressions that he would make,” said Eghbali, on the phone from Chicago. “He had everyone laughing including himself.”

Eghbali, a Grade 3 student at Dallington Public School, was “a very creative and curious student,” a letter sent out by the school reads. “She enjoyed coming to school and approached her learning with enthusiasm.” School officials wrote that Eghbali’s “thinking was out of the box and she brought new, innovative ideas to her classmates.”

“Maryam was a kind person, a devoted mother, wife and friend,” Eghbali said. “She always made us feel welcome, she made you feel loved.”

Eghbali said Shahzad had a creative mind.

“She had a great giggle and she just meant so much to her parents,” she said.

“They were a wonderful family and they’ll be truly missed.”

Pegah Safar Poor Koloor, GTA

York University identified Pegah Safar Poor Koloor as one of three students lost in the tragedy. Koloor was a first-year Faculty of Science student, studying biology.

York joined universities across the country in paying tribute to the victims of the crash with a moment of silence on Wednesday.

‘A sense of disbelief’ as losses are counted in Edmonton’s Iranian community - By Kieran Leavitt - Wed., Jan. 8, 2020

Source : [HM000P][GDrive]

EDMONTON—A newlywed couple. A family of four. Students returning from their winter break.

Edmonton’s small Iranian community was counting its losses in a state of shock Wednesday after a plane crash in Iran that left 176 people dead — including more than five dozen Canadians, many of whom had been travelling home to Alberta.

“More than anything, people are mourning,” said Pegah Salari, an active member of the city’s Iranian community. “We are still at that initial state of grief when everyone’s so shocked.”

The Ukraine International Airlines Boeing 737-800 was en route to Kyiv, Ukraine’s capital, when it crashed shortly after take off, killing all aboard. There were 63 Canadians on the flight and Prime Minister Justin Trudeau said 138 passengers were on their way to Toronto.

While a list compiled by the community pegged the city’s losses at 25 people, the Star has so far been able to independently confirm that 13 members of the local Iranian community died in the crash.

“The impact is so big, because of the large number of individuals involved, that it’s going to take some time for us to actually comprehend what actually happened,” Salari said.

“More than anything, it’s a sense of disbelief right now.”

Edmonton has around 4,300 people of Iranian origin, according to a 2016 Statistics Canada census, compared to about 95,000 in the Greater Toronto Area and 45,000 in Vancouver. At a Wednesday media availability, Reza Akbari, president of the Iranian Heritage Society of Edmonton, estimated Edmonton’s Iranian community is closer to 5,000 people, and up to 6,000 when students are included.

He said the University of Alberta has been a popular destination for Iranian students because it’s perceived as one of the top research universities in the country, specifically citing their engineering, energy and environment programs.

Masoud Ardakani, the University of Alberta’s associate chair of electrical and computer engineering, confirmed in an email that professors Mojgan Daneshmand and Pedram Mousavi were on the flight, along with their daughters Daria, 14, and Dorina, 9.

Daneshmand is listed as an associate professor in the engineering department at U of A, as well as Canada Research Chair Tier II in Radio Frequency (RF) Microsystems for Communication and Sensing. Mousavi worked in the same department as a professor in mechanical engineering.

Pedram Mousavi, 47, Mojgan Daneshmand, 43, and their daughters, Daria Mousavi, 14, and Dorina Mousavi, 9, seen in this family photo posted to Pedram Mousavi’s Facebook account in 2014, were killed in the plane crash near Tehran early Wednesday. The family lived in Edmonton and Mousavi and Daneshmand were professors at the University of Alberta.

Friend Nooran Ostadeian remembered Daneshmand and Mousavi as the “happiest couple” she had known. Ostadeian had known them since 2010 when she helped them find a home as a real estate agent when they moved to Edmonton.

“I want them to be remembered as a symbol of love, community members who did a lot ... Great teachers for their students.”

Maryam Hajazi, who coached Dorina in a soccer program, remembers the girl as being intelligent and curious. She would frequently ask questions about techniques and how she could be the best player she could be.

“She most probably got the gene from her parents,” Hajazi said. “She was so smart, everyone liked her.”

The Calgary Board of Education, meanwhile, confirmed that Arshia Arbabbahrami was an international student in Grade 12 at Western Canada School, who was returning to Canada after spending the holidays with his family in Iran.

Principal Carma Cornea sent an email to students and families that said Arbabbahrami was active in track, as well as the swim and dive teams: “He dreamt of being a doctor and was a leader in our community who many students looked up to.”

Ramin Fathian worked in the same office as Nasim Rahmanifar, who was working on her master’s degree in mechanical engineering at the U of A and was considering a second master’s or doctorate.

She had started the program in May 2019, and Fathian remembers how anxious and scared she was of Edmonton’s winter, having lived most of her life in Iran. He said their group of friends spent time together every weekend, frequently playing volleyball. Rahmanifar was always eager to go back to Iran.

“She was super excited to get back home to visit her family … She missed them a lot,” he said.

Also on board were young newlyweds Arash Pourzarabi and Pouneh Gorji, of Edmonton. Payman Parseyan, an active member of the Iranian community, said they’d married days before boarding the plane.

Newlyweds Arash Pourzarabi, 26, and Pouneh Gorji, 25, are seen in this March 2019 photo taken by friends in Edmonton. The couple was killed in the plane crash near Tehran Wednesday.

Uploaded by: Fowler, Tanis

Amir Samani, a graduate student in the same computer science department Gorji and Pourzarabi belonged to, said he remembers Pourzarabi going out of his way to help with his studies.

“I’m in big denial right now. I can’t understand what’s going through my mind,” he said. “I even check my phone to see, is he going back online again? Are we going to talk again?”

He said it was good having friends of Iranian ancestry at the university because there isn’t a huge Iranian community in Edmonton. He wasn’t able to go to the couple’s wedding, but had hoped to attend a small ceremony with friends upon their return.

Pourzarabi was working on a graduate degree in artificial intelligence at the University of Alberta, and his supervisor, Professor Michael Bowling, said the couple loved to spend their free time exploring new parts of Edmonton.

What we know and don’t know about Ukraine International Airline Flight 752

Bowling described Pourzarabi as “so bright.”

“Not just smart, which you have to be doing a graduate degree in artificial intelligence,” he said in an email, “but he brought a brightness to each meeting … particularly with his smile.”

Throughout the day, community organizations and members were co-ordinating vigils with hundreds expected to attend. On Wednesday night, mourners gathered for a candlelight vigil outside the Alberta legislature in Edmonton.

Salari said the high number of Edmonton community members on board likely had to do with sanctions and travel restrictions that Iranians have to grapple with when flying. There aren’t as many airlines flying to Iran and options are limited.

“For as long as I can remember, there was a few preferred airlines that would allow for people to travel with all the limitations that are on them,” she said.

Few members of Edmonton’s Iranian community in the city will be left untouched by the loss of life, Salari said.

Akbari, with the Iranian Heritage Society, said there will be a vigil held on Friday but the exact time and location was still being confirmed.

Edmonton’s Iranian community hit by economic fallout as U.S. leaves nuclear deal - Thu., May 10, 2018 - By Ameya Charnalia

Source : [HM000O][GDrive]

EDMONTON—Members of the Iranian community in Edmonton are dismayed by U.S. President Donald Trump's decision to withdraw from the Iran nuclear deal.

"It's unfortunate to see the Trump administration vetoing this agreement without another agreement in place," said Payman Parseyan, president of the Iranian Heritage Society of Edmonton. "This can have long-term negative consequences for everyone at the table."

Iran agreed in 2015 to allow international supervisors to monitor its nuclear activities, reassuring other nations that it is not developing weapons of mass destruction. In return, those nations would lift a number of crippling economic sanctions.

Trump announced Tuesday that the United States will withdraw from the landmark agreement. Tearing up the deal was one of his campaign promises.

"The fact is this was a horrible one-sided deal that should have never, ever been made," Trump said Tuesday. "It didn't bring calm, it didn't bring peace and it never will."

Parseyan said the decision had an immediate financial impact.

"It's sending the Iranian economy into a downward spiral," he said. "The average Iranian is struggling more and more to provide basic needs to their families."

The Iranian rial has indeed plunged since the announcement, which is affecting Edmontonians who rely on remittances or pension payments from Iran, said Behrouz Khani, an Iranian-Canadian in Edmonton.

"It makes it harder for people who are living here," Khani said.

He added that there are several Canadian citizens of Iranian descent who rely on family in Iran for their retirement income, too.

"They transfer their retirement money from Iran to here every month, or once in while, and now they have lots of issues because the rate goes up," said Khani.

There are 5,000 to 6,000 people with either Iranian or Iranian-Canadian citizenship in Edmonton, according to Parseyan.

On Wednesday, Prime Minister Justin Trudeau said the Iran nuclear deal wasn't perfect but it helped prevent the country from developing a nuclear weapon.

Trudeau also stressed that Canada is firmly aligned with most countries in supporting the deal, formally known as the Joint Comprehensive Plan of Action (JPCOA).

"We know that standing firmly in support of the JPCOA with our NATO allies and others is extremely important," Trudeau said. "We regret the decision by the United States to pull out, but we are still hopeful we are going to be able to keep Iran from developing nuclear weapons."

Six countries negotiated the deal, including the five permanent members of the United Nations Security Council — the U.S., Britain, France, China and Russia — as well as Germany.

German Chancellor Angela Merkel said the decision underscores the need for Europe to take increasing responsibility for peace and security, similar to the message she delivered after Trump's debut at last year's G7 summit.

Parseyan said it is the Iranian people who lose the most.

"They don't understand why the average Joe has to suffer because of conflicts between two nations," Parseyan said.

UUNET, founded in 1987, was one of the largest Internet service providers and one of the early Tier 1 networks. It was based in Northern Virginia and was one of the first commercial Internet service providers. Today, UUNET is an internal brand of Verizon Business (formerly MCI).

History[edit]

Background[edit]

Prior to its founding, access to Usenet and e-mail exchange from non-ARPANET sites was accomplished using a cooperative network of systems running the UUCP protocol over POTS lines. During the mid-1980s, growth of this network began to put considerable strain on the resources voluntarily provided by the larger UUCP hubs. This prompted Rick Adams, a system administrator at the Center for Seismic Studies, to explore the possibilities of providing these services commercially as a way to reduce the burden on the existing hubs.

Early existence[edit]

With funding in the form of a loan from Usenix, UUNET Communications Services began operations in 1987 as a non-profit corporation providing Usenet feeds, e-mail exchange and access to a large repository of software source code and related information. The venture proved successful and shed its non-profit status within two years. At the same time, the company changed its name to **UUNET Technologies**. In 1990, UUNET launched its AlterNet service, which provided access to an IP backbone independent of the constraints of those operated by the government. That network lives on in a much larger form and serves as the core of a set of products which include access at dial-up and broadband speeds as well as web hosting. UUNET raised $6 Million from Accel Partners, Menlo Ventures and New Enterprise Associates in 1993 and $8.2 million in 1996 for expanding its network and hiring new executives with experience in marketing.[1]

In the mid-1990s, UUNET was the fastest-growing ISP, outpacing MCI and Sprint. At its peak, Internet traffic was briefly doubling every few months, which translates to 10x growth each year. However, the continuing UUNET claims of such growth (long after it had fallen to lower, albeit still substantial levels) artificially fueled the expectations of the dot-com and telecom companies of the late 1990s, leading to the dot-com bubble and crash in 2000/2001.[2]

Mergers and acquisitions[edit]

In 1996, UUNET was acquired by MFS on April 30, 1996. This was an independent acquisition unrelated to the acquisition of MFS by Worldcom. However, as MFS was a public company and the acquisition made the company a Wall Street darling,[3] it likely influenced Worldcom's decision to pursue MFS.[4]

In 1996, UUNET was acquired by WorldCom on August 26, 1996, as part of WorldCom's purchase of MFS Communications Company.[5]

In 2001, UUNET was fully integrated with WorldCom and the name was dropped from all official documents.

In 2002, the owner of UUNET at that time (WorldCom) filed for what was then the largest Chapter 11 bankruptcy protection in history.

In 2005, its Internet service and infrastructure, assigned AS701, maintained the highest outdegree of any ISP.[*clarification needed*][6][7]

Verizon[edit]

In 2006, WorldCom was purchased by Verizon Communications and now operates under the Verizon Business name.

Spam[edit]

SpewSpewNet[edit]

After it had been sold and resold during the onset of the dot-com bubble, UUNET acquired the nickname *SpewSpewNET*. This nickname was given because UUNET had become a home for many distributors of spam, including distributors of both Newsgroup spam and E-mail spam. UUNET also became known for providing bulletproof hosting to many web pages whose chief form of advertisement was spam. Because UUNET started with a loan from Usenix and controlled the e-mail addresses for moderated Usenet groups, it was hard to block email traffic to or from Usenet. In 1997, UUNET had lost so much credit that on 1 August, after finding alternate routes for moderated newsgroups, a Usenet death penalty (UDP) was issued against UUNET.[8] A week later, the UDP was lifted.[9] In 1998 UUNET threatened legal action[10] for hosting a GIF image with "SPAMUNET" on it.[11]

Timeline[edit]

- 1987 – UUNET Communications Services is founded and passes its first traffic via the CompuServe Network on 12 May using UUCP (Unix to Unix Copy Protocol).
- 1989 – UUNET becomes a for-profit corporation
- 1990 – UUNET launches AlterNet
- 1991 – UUNET participates in the founding of the Commercial Internet Exchange Association
- 1992 - UUNET with MFS co-creates MAE-East, for a time the world's busiest Internet exchange and "center of the internet"
- 1994 – Microsoft paid $16.4 million for a 15 percent share of the company
- 1995 – In May, UUNET is listed on the NASDAQ stock market in an initial public offering that would become part of the beginning of the dot-com boom.
- 1995 – UUNET Technologies Inc places a takeover bid against Unipalm Pipex.[12]
- 1996 – UUNET Technologies agreed to a merger with the Microsoft backed MFS Communications Company.[13]
- 1996 – Metropolitan Fiber Systems (MFS) acquires UUNET for $2 Billion on 12 August 1996. This marked the day UUNET stopped existing as an independent company.
- 1996 – WorldCom acquires MFS on New Year's Eve – 31 Dec. at 11:58 p.m EST for $12.4 billion
- 1997 – Usenet death penalty (UDP) issued against UUNET, and lifted a week later
- 1997 – On 10 November, WorldCom and MCI announced their US$37 billion merger including combining internetMCI & UUNET Internet operations.
- 1998 – The combined MCI WorldCom opens for business on 15 September after being given the go-ahead from the DOJ, subsequent to divesting internet MCI.[14]
- 1998 – WorldCom acquires CompuServe Network Services from H&R Block and ANS Communications from AOL. Both become part of UUNET in 1999.
- 1999 – On 5 October, MCI Worldcom announces its intentions to buy Sprint for $129 billion.
- 2000 – The European Commission and DOJ denied the MCI WorldCom / Sprint merger on Antitrust Grounds.
- 2001 – The UUNET brand is folded into WorldCom's product line and disappears
- 2002 – WorldCom files for Chapter 11 bankruptcy protection as a result of a massive $11 billion accounting scandal.
- 2003 – The UUNET brand re-emerges as WorldCom's wholesale-only brand.
- 2004 – WorldCom emerges from Chapter 11 bankruptcy and renames itself to MCI, still using the UUNET brand for wholesale business.
- 2005 – MCI again drops the UUNET brand for wholesale business. The name is no longer in use.
- 2006 – Verizon acquires MCI, including its UUNET subsidiary, now known as Verizon Business. AS701 remains the backbone of Verizon Business although its origin dates back to 1990 when it was under the UUNET flag.

1996 (May 06) - Baltimore Sun - $189 million bonanza on lucky venture MFS' takeover of UUNET to benefit local firm's clients; Humbled and looking ahead; At NEA it's 'thank God and we're on to the next dream'

Timothy J. Mullaney ; Source : [HN01CS][GDrive]

Of all the beneficiaries of last week's $2 billion deal for [MFS Communications Company, Incorporated] to take over Internet access provider [**UUNET Technologies, Incorporated**], one of the biggest will be a Baltimore venture capital firm that stands to make $189 million on a $4 million investment.

New Enterprise Associates controlled 10.1 percent of Fairfax, Va.-based Uunet, having paid $3.9 million for the stake in 1994. NEA endured a wild roller-coaster ride in Uunet's stock price after the company went public last May, and stands to make a killing for its clients when the merger goes through. [...]

The 18-year-old firm has invested in about 320 companies, which [NEA general partner Charles W. Newhall III] said have $18 billion in annual revenues. NEA has capitalized on the historic bull market for new stock issues that has made millionaires out of people who founded NEA-backed companies such as Genetic Therapy Inc. of Gaithersburg and Integrated Health Systems Inc. of Owings Mills.

In most cases, venture capitalists get paid when a company is sold or goes public. NEA's 15 initial public offerings last year topped the venture capital industry for the third time in four years, according to a report by San Francisco-based Venture-One Corp.

"Over the last five years, NEA has averaged one IPO a month -- a remarkable track record for an entrepreneurial money machine," Venture-One said.

Not nearly all the cash from the [**UUNET Technologies, Incorporated**] takeover will go to NEA's principals, however. The investment was made with part of a $200 million fund the firm raised from pension funds and other investors in the early 1990s, Newhall said. NEA principals put up 1 percent, and otherwise get paid a share of the profits above the $200 million invested. Given the hit on Uunet, almost any return at all on the other $196 million in the pool is pure profit. [...]

[**UUNET Technologies, Incorporated**] founder **Richard Adams** was basically an engineer with a vision when he went looking for money in 1994. He met up with NEA, and with two other venture firms, and quickly raised the money he needed to move forward.

But it came with a price. The venture capitalists decided that [**UUNET Technologies, Incorporated**] needed upgraded management. "They said, basically, we're going to hire a management team and we're going to put some money in," said **UUNET President and Chief Executive [John William Sidgmore (born 1951)]**. "They brought people in in early '94."

[John William Sidgmore (born 1951)], **a colleague of NEA partner Peter Barris when they both worked for General Electric Co.**, was at the top of the list. **He had sold Intelecom Solutions, a Montgomery County software firm, to Computer Sciences Corp. in 1991 and was still running Intelecom for the new owner when Barris approached him.**

"He basically convinced me this would be an exciting area to work in," Sidgmore said. "It was a little tiny company, much smaller than the one I was running. But Peter convinced me it was a terrific opportunity." [...] Sidgmore said. "No, of course [I didn't know how terrific the opportunity was, ...] but you have to remember no one knew anything about the Internet two years ago. Now everyone thinks they're an expert."

What happened in between was 1995. [**UUNET Technologies, Incorporated**] did some big things right, and also rode a wave of interest in the Internet that was mostly beyond its control.

On its own, UUNET decided to focus on the business market, avoiding low-margin competition with the likes of America Online for consumers' business. And it made a key alliance with software titan Microsoft Corp., which took a 13 percent stake in Uunet.

"Microsoft, in essence, financed development of the network," [John William Sidgmore (born 1951)] said.

By then, the media had joined the Internet hype, and so had the stock market. And, Sidgmore says, there was good reason.

"People realized the Internet would become a revolutionary technology," he said. "It enables virtually everyone to communicate with each other, and it was dramatically cheaper than conventional networks. These two things were a sea change."

The wave allowed [**UUNET Technologies, Incorporated**] to go public at $47 a share last May. From then it was a roller-coaster, with the stock rocketing above $70, then plummeting as low as $24.50 after AT&T; Corp. said it was getting into the Internet access business, then rebounding as optimists comforted themselves with the idea that upstart AT&T; challengers past have grown into companies like MCI Communications Corp.

The takeover price was $61 a share. But the deal attracted negative attention as well, because suspicious trading in Uunet options made it appear news of the deal had leaked prematurely. Sidgmore said the company doesn't know who bought the options before the deal.

"A lot of communications technologies have come and gone, and AT&T; hasn't dominated them," Newhall said. "We felt that if you went into the business end of the Internet backbone, you could add products and services to be competitive."

But Sidgmore said the company made the deal because moves like AT&T;'s entry make the Internet business much more competitive.

The Virginia company simply needed a bigger partner with deeper pockets to make the technology investments Uunet will need to keep up.

"The Internet is getting very serious, and there are going to be a lot of very serious players," he said. "If we want to remain a leader, we were not going to be able to do it on our own."

Newhall said NEA's 16 investment professionals, based on St. Paul Street and in Silicon Valley, live by their ability to spot trends, mostly in health care and information technology industries. "In our business, our success is determined by our ability to participate in things that change the way the world is," he said. "I think we've done that."

"We've basically succeeded in what we dreamed of doing: starting businesses that are important."

1996 (Aug 27) - NYTimes : "Worldcom to Buy MFS for $12 Billion, Creating a Phone Giant"

By Mark Landler ; Source : [HN01CQ][GDrive]

In a sign of the rush toward "one-stop shopping" in telephone service, [WorldCom Corporation] agreed to buy [MFS Communications Company

In a sign of the rush toward "one-stop shopping" in telephone service, [WorldCom Corporation] agreed to buy [MFS Communications Company, Incorporated] yesterday in a stock deal worth approximately **$12 billion**.

The combination of Worldcom and MFS creates the nation's first fully integrated local and long-distance phone company since the breakup of the Bell System in 1984. And though the companies are hardly household names, together they promise to be a new giant in the lucrative market of providing communications services to business customers.

By combining networks, MFS Worldcom will be able to offer corporate customers a full complement of services: local and long-distance phone, data transmission and access to the Internet. Worldcom, the fourth-largest long-distance carrier, has until now primarily sold its network capacity to other long-distance companies. MFS is the leading provider of alternative local phone services to business customers seeking better prices or services than are available from the local telephone monopolies.

For all its size, however, yesterday's merger is only the third-largest deal of the year in the roiling telecommunications industry, outranked by the $22.1 billion combination of Bell Atlantic and Nynex and the $16 billion merger of SBC Communications and Pacific Telesis.

And unlike those pending mergers, yesterday's deal will have scant impact on residential customers. Worldcom and MFS plan to focus almost exclusively on the business market, where for years big corporate customers have purchased phone service from carriers that lacked such familiar brand names as AT&T or Nynex.

Still, analysts and executives said the merger was another milestone in the redrawing of the communications landscape that began when the Government deregulated the industry in February.

"It's highly significant because it elevates one more player into the ranks of end-to-end service providers," said Paul T. Unger, a telecommunications consultant at A. T. Kearney.

Together, MFS and Worldcom will have $5.4 billion in revenues, operations in 45 domestic markets and 500,000 corporate customers. Worldcom will issue 500 million to 550 million shares to acquire MFS.

In Nasdaq trading yesterday, Worldcom's stock dropped $3.625, to $22.75, while **MFS jumped $9.94, to $44.81**.

MFS Worldcom faces plenty of competition in the business market. AT&T, MCI and Sprint are moving rapidly to offer packages of services to corporate customers. And the Baby Bells intend to be full-service providers as well, though they will cater primarily to businesses in their own regions.

Several analysts said the merger presaged even more deals, and they pointed to another alternative local-access provider, the Teleport Communications Group, as the next potential takeover. Teleport announced a deal with AT&T yesterday to carry long-distance calls by connecting its local networks in large cities to AT&T's nationwide network. Teleport's shares rose $1.375, to $23.625.

Neither MFS nor Worldcom is a stranger to mergers. MFS, which is based in Omaha, acquired a leading Internet access company, [UUNET Technologies, Incorporated], for $2 billion in April. And Worldcom, which is based in Jackson, Miss., was cobbled together from several small long-distance companies, reaching its current configuration through the $2.5 billion joining of LDDS and Wiltel Network Services in January 1995.

Analysts generally praised the latest deal, which was reported yesterday in The Wall Street Journal, though some noted Worldcom was paying a lofty premium. Under the terms of the deal, each share of MFS common stock will be exchanged for 2.5 shares of Worldcom stock. Based on yesterday's closing price, that values MFS shares at $47.80 each -- a 37 percent premium to the market value on Friday.

MFS, which has invested heavily to build fiber optic networks, had revenues of $583.2 million in 1995, but lost $267.9 million. "You're paying $12 billion for a company with negative net income and negative cash flow," said one analyst, who insisted on anonymity.

That prospect apparently does not daunt Bernard J. Ebbers, the president and chief executive of Worldcom, who proposed the merger to the chairman of MFS, [James Quell Crowe (born 1949)], over dinner two weeks ago at Mr. Crowe's home in Omaha. The two men took barely two weeks to hammer out a deal the size of Time Inc.'s 1990 acquisition of Warner Communications.

Mr. Ebbers, whose flowing hair and relaxed manner make him look more like a country-and-western singer than a corporate executive, will be the chief executive of the new company. [James Quell Crowe (born 1949)] will be the chairman.

Worldcom's current chairman is John W. Kluge, the billionaire investor and a major shareholder in the company. Mr. Ebbers said Mr. Kluge would step down when the merger is completed in four to eight months. He said it was not clear whether Mr. Kluge would remain on the board.

Mr. Ebbers said the companies did not plan any layoffs. But the merger will probably claim at least one casualty in the executive suite. Royce W. Holland, the president and chief operating officer of MFS and one of its founders, said he would probably depart in a few months.

"I've been at this for nine years," Mr. Holland said yesterday, "It's probably time for me to take a little time off."

In a joint interview, Mr. Ebbers and Mr. Crowe said the merger would give them a critical jump over AT&T, MCI and other rivals in offering a bundle of services to business customers.

Worldcom owns a fiber optic backbone that snakes around the country, while MFS has scores of smaller fiber optic rings in local markets. By connecting the companies' combined 25,000 miles of fiber, the two executives said they would be able to carry traffic entirely on their own networks.

"Being first to market is a tremendous advantage, because building these networks is not an overnight proposition," Mr. Ebbers said.

AT&T, MCI and Sprint do not own local systems. So as they move into the local phone business they must either lease capacity from the Baby Bells, or construct their own local switches and networks. The Baby Bells, meanwhile, are prevented from entering the long-distance business until they can demonstrate that their local markets are truly competitive.

Combining Worldcom and MFS will also squeeze savings out of both companies. Daniel Reingold, an analyst at Merrill Lynch & Company, estimated that MFS would save about $40 million a year by diverting its long-distance traffic from AT&T and other carriers to Worldcom's network. And Worldcom could save $200 million to $400 million in access charges by using MFS's local networks to connect calls from its long-distance customers.

Worldcom has racked up an impressive annual return to shareholders of 57.3 percent in the last decade -- in part by aggressively acquiring and managing other telephone companies.

"They've shown an ability to integrate acquisitions," said Simon Flannery, a telecommunications analyst at J. P. Morgan & Company, "It's important to look at their track record in analyzing this deal."

Whatever Mr. Ebbers's talents as a manager, some observers question whether he needed to buy MFS -- particularly given the $12 billion price tag. With fiber optics and digital technology expanding the capacity of telephone wires, some analysts forecast an eventual glut of network circuits that will probably enable long-distance carriers to lease capacity on local networks at increasingly favorable rates.

P. William Bane, a telecommunications consultant at Mercer Management Consulting in Washington, said Worldcom might have been able to get into the local phone business simply by leasing capacity on the local networks of the seven Baby Bells.

Indeed, MCI Communications announced something resembling such a deal yesterday with Nextwave Communications, a company that plans to offer a new type of local cellular service, called personal communications services. MCI will lease capacity on Nextwave's wireless system and sell it under the MCI brand name.

"If they can fill in all the pieces, they'll do very well," Mr. Bane said of MCI. "And they won't have to buy anything."

William Robert Van Cleave (August 27, 1935 – March 15, 2013) was a former advisor to President Ronald Reagan, the United States Department of Defense, and Department of State as well as Emeritus Professor, former head, and the founder of Missouri State University's Department of Defense and Strategic Studies (DSS). The DSS program is now located in Fairfax, VA, 10 miles from Washington D.C. [1] He was also advisory council member of the Center for Security Policy,[2] board advisor of the American Center for Democracy and National Institute for Public Policy.[3] As a strategic thinker, he is remembered as a leading Cold Warrior and long-standing hawkish policy advocate.[4][5]

Academic background and military service[edit]

Van Cleave received a B.A. in political science from the California State University, Long Beach as well as his M.A. and Ph.D. (1967) from the Claremont Graduate School (now Claremont Graduate University). His dissertation was titled "Nuclear Proliferation: The Interaction of Politics and Technology," and supervised by Harold W. Rood. He was Senior Research Fellow in National Security Affairs at the Hoover Institution on War, Revolution and Peace at Stanford University.[6]

Van Cleave was Professor and Director of the Defense and Strategic Studies Program at the University of Southern California from 1967-87. Under his leadership, the DSS program started in 1971 in the School of International Relations at USC. The primary objective of the program was to provide graduate level education and training for students planning careers in national and international security affairs, policy-making, and teaching at the university-level. The program moved to Southwest Missouri State University (now MSU) in 1987 where DSS became a Department offering specialized Master of Science degree. In 2005, the University moved the Department physically to Fairfax, VA to take advantage of the many opportunities that are unique to the D.C. metropolitan area.[1][7]

Military service[edit]

Van Cleave enlisted in the United States Marine Corps at the age of 17, and became a Marine Security Guard at the American embassy in Vienna during the time of the Allied-occupied Austria following World War II. In 1957, he transferred to the Marine Reserves, and became an officer.

Governmental and Professional Services

Van Cleave's past professional experience included being a member of the **U.S. Delegation to the Strategic Arms Limitation Talks [S.A.L.T.] with the USSR**, Chairman-Designate of General Advisory Committee on Arms Control and Disarmament Agency, Special Assistant for Strategic Policy and Planning in the Office of the Secretary of Defense, member of the Team B effort to review national intelligence on the USSR and to produce a competitive National Intelligence Estimate. From 1979 to 1981 he was Senior Advisor and Defense Policy Coordinator to Ronald Reagan and Director of the Department of Defense Transition Team between the administrations of President Carter and President Reagan. He was also a former officer at the U.S. Marine Corps.[6][7]

He was the Director of the Division for Research in Strategy at the Institute for Advanced Strategic and Political Studies (IASPS)[7] Trustee member of the International Institute of Strategic Studies, and Board Member of the Committee on the Present Danger.[4]

Professor Van Cleave has approximately 200 professional publications, and has received numerous awards for his outstanding work as a teacher and faculty member. He was the 1979 Claremont Graduate University Distinguished Alumni Award Recipient.[8]

Professor Van Cleave died on March 15, 2013[9] and is buried in Hemet, California.

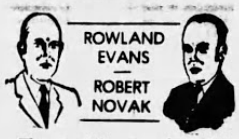
Inside Report

Weinberger Makes It Clear Who Is Boss

WASHINGTON — Unease within the defense community over Caspar (Cap) Weinberger has blossomed into panic now that the secretary of defense-designate has booted out "Reaganaut" military advisers, trashed their recommendations and at least opened the door for soft-liners.



The certain appointment of Frank Carlucci, the Carter administration's deputy CIA director, as deputy secretary of defense is the visible tip of concealed events. In a Dec. 20 shouting match, Cap the Knife fired defense expert William Van Cleave as transition chief, blackballed him and his team from Pentagon posts and consigned their reports to ash cans. Since then, a collection of personalities never connected with strong defense have been edging into the Reagan transition.

The most charitable explanation is that this is no conspiracy but the product of Weinberger's nearly total ignorance on defense questions, which was fully revealed in his Senate confirmation hearing. But assuming Weinberger finally learns the names and issues involved, he has lost valuable time in revising defense spending and lost invaluable experts he badly needs.

In this as in other transition wars these past two months, Ronald Reagan's presence is barely felt. There has been no gesture from either the president-elect or his chief aide, Ed Meese, that they regard a radical reconstruction of the nation's depleted defenses as top priority.

Consider the Reagan-Meese view toward Weinberger's insistence on Carlucci, a civil servant with no Defense Department background, as deputy secretary. Reagan's "kitchen cabinet" unanimously recommended against it, as did his defense transition team. The president-elect might then have suggested saving the deputy secretary's spot for an expert. Instead, Reagan acquiesced.

That was the situation when Van Cleave, Reagan's defense adviser throughout the campaign, went to California Dec. 20 to brief Weinberger. The secretary-designate was in an ugly mood. He unjustly believed Van Cleave was responsible for a press campaign against Carlucci.

An icy Weinberger informed Van Cleave that he and his team's services were terminated forthwith. The hot-tempered Van Cleave shouted that his responsiblity was to advise Reagan himself and Weinberger could not fire him. Weinberger shouted back that Van Cleave was deceiving himself; he was gone.

Weinberger was correct. Early in the transition period when Van Cleave crossed swords with transition overseer William Timmons, a Timmons aide asked Meese whether Van Cleave was under the president-elect's protection. No, replied Meese, fire him if you want. The trouble blew over temporarily, but Reagan has not come to his defense adviser's aid.

Van Cleave was not the only victim. His team's members, including some of the nation's leading military experts, are blackballed. That includes the highly-esteemed Ben Plymale of Boeing, who made the disastrous Dec. 20 trip west with Van Cleave. Plymale had been expected to be an adornment of the Reagan Pentagon as under secretary for research.

The defense plans fastidiously prepared by Van Cleave, Plymale and associates will never be read by Weinberger. That may well prevent any Reagan hurry-up plans for accelerated spending in the current fiscal year.

Pentagon offices formerly occupied by the Van Cleave team are now mostly empty. In charge of the skeleton crew there is an old Weinberger-Carlucci comrade from HEW days in the Nixon administration: William Howard Taft III, a Washington lawyer who knows even less about defense than Weinberger and Carlucci. Yet, incredibly, Taft has wound up on the list for the department's No. 3 post; under secretary for policy.

Taft has been conferring on defense matters with Richard Stubbing, a Carter administration anti-defense expert at the Office of Management and Budget (OMB) whose views generally coincide with Sen. George McGovern's. With Reaganauts exiled to oblivion, among those briefing Weinberger for his confirmation hearing were two Carter officials; Jack Stempler, assistant defense secretary for legislative affairs, and Brig. Gen. Carl Smith, military assistant to Defense Secretary Harold Brown.

Carlucci has been consulting with his close friend (another HEW old hand), John Rhinelander — who was a passionate arms-controller as a State Department lawyer. Carlucci told us Rhinelander will not go into the Reagan administration and denied he even knows Barry Blechman, a former Carter administration arms-controller now at the Carnegie Endowment. But a memo circulating on Capitol Hill lists Blechman as a possible assistant secretary of defense.

There are antidotes. Secretary-designate Alexander Haig has moved quickly to install a Reaganaut staff at the State Department. The National Securtiy Council (NSC) staff will be filled with Reaganauts, possibly including Van Cleave. Despite his less-than-reassuring confirmation testimony, Weinberger may soon learn enough to reflect Reagan's philosophy in personnel and policy. But for now, one Senate conservative is calling Weinberger "another Harold Brown with one difference — Brown knows something about defense."

Bible Digest

"A man's pride shall bring him low: but honor shall uphold the humble spirit." Proverbs 29:23 Pride is a killer that has slain many spiritual giants. When a person gets wrapped up in himself he makes a pretty small package.

"I am the bread of life." John 6:48 In an age of miracles and mechanism, it is a sad report that half of the world goes to bed with empty stomachs, because the other half retires with empty hearts.

WGBH - War and Peace in the Nuclear Age; Missile Experimental; Interview with William Van Cleave, 1987

Part of War and Peace in the Nuclear Age.

12/09/1987

William Van Cleave was an academic specializing in strategic issues. He was involved with the Strategic Arms Limitation Talks (SALT) and a member of Team B in the 1970s. In 1980-1981, he was a senior adviser to presidential candidate Ronald Reagan and directed his defense transition team. He begins with a description of the Soviet threat and the Carter administration's approach to dealing with it, of which he is critical. He explains his belief in the window of vulnerability, describing its implications but also assessing the differing views of others on the topic, notably members of the Scowcroft Commission. He goes into depth on the MX missile and the complex issue of basing, listing his objections to President Carter's preferences and outlining the three-pronged approach he proposed to President-elect Reagan. He also lists the problems the SALT process posed to these ideas. In subsequent months, the Reagan administration made certain policy decisions to which he objected. He singles out Defense Secretary Caspar Weinberger for lacking technical background and personal interest in the subject, but he also notes certain Air Force conceptions and practices in a critical light. As early as October 1981 he found himself believing that the Carter Administration approach was far preferable to what their successors had chosen. He explains why he came to see a crash program on a small, single-warhead missile as the best option for a land-based defense. He further argues that a Soviet surprise attack is both a credible scenario and the only planning factor that makes strategic sense. He opposes idea of giving up the land-based leg of the triad mainly because it depends on arms control agreements to which the Soviets would never agree.

1987-12-09-wgbh-openvalut-war-and-peave-in-the-nuclear-age-william-van-cleave-interview.pdf

1987-12-09-wgbh-openvalut-war-and-peave-in-the-nuclear-age-william-van-cleave-interview-dialogue-txt.txt

Interviewer: ASKS HIM TO REVIEW WHAT SOVIET THREAT WAS TO OUR FORCES.

Van Cleave: Obviously concern began to grow about land-based force, particularly ICBM vulnerability in the late 1960s. Particularly reflected in the March '69 decision by the new Nixon Administration to reshape the planned ABM program into a first priority for defending the Minuteman force. So the Safeguard ABM program as described and debated in 1969 and 1970 really focused on the survivability, vulnerability problems of that time. Of course in 1972 when we gave away defense of the ICBM force and everything else, against ballistic missiles, then the entire scientific defense community turned to examining a variety of ways that one could make a land-based ballistic missile force more survivable than if it were in fixed, known, undefended locations. And between about '72 when the ABM treaty was signed and the end of the 1970s, 30 some different basing modes had been fairly well studied during that time. As a matter of fact I'd say that there's no single defense problem that I know of that was so thoroughly studied as the problem of ICBM vulnerability in the 1970s. Through all of that there was a perception that the threat would inevitably take place. The only dispute was over how long we had and to what extent the threat would be. That is to say, how great was the threat in terms of how few of Soviet resources had to be used in order to pose a vulnerability problem. In 1976 we had the B Team on competitive intelligence. I was a member of the B Team, Mr. Paul Nitze was, Richard Pipes of Harvard, and a few others. We were charged by President Ford with reviewing intelligence estimates on Soviet strategic force programs and capabilities. Looking backwards to see if they were wrong, what accounted for them being wrong, and then doing our own competitive estimate at this point in time. The B Team in '76 warned that there would be far more rapid advancements by the Soviet Union in the number of MIRVed re-entry vehicles and in the accuracy of those vehicles than the intelligence community then projected. We felt that there would be a window of vulnerability by the early 1980s. The Carter Administration came in 1977 and not only ignored the B Team report because what it conflicted with what it preferred to view of reality, intentionally threw the B Team report out. So the first Carter MX program proposed in 1977, as I recall, that it be placed then in Minuteman silos. It was Congress that intervened at that time and said, "No chance. We're not going to have you improve the capability of a missile without commensurate improvements in the survivability. Go back and study survivability schemes. Well the Carter Administration of course did that and what it discovered at that point of time was that of all the studies of the 70s the bottom line was generally that some form of preservation of location uncertainty through multiple shelters, in one form or another, preferably austere vertical shelters, was by far the preferred system. He had a problem. It was never resolved and hasn't been resolved by the Reagan Administration. And that is the MX missile is a SALT arms control missile, it's not a strategist's missile. And it made basing particularly difficult. It really reduced any options of mobility. It did make keeping its uncertainty of location very difficult because of the sheer mass and weight and electronics and mechanics associated with it. But the Carter Administration was committed to the MX missile. By '79 I think the Carter Administration, certainly people like Harold Brown and William Perry, were beginning to perceive that the B Team's projections were accurate and we're acknowledging in unclassified Congressional hearings that we would have a real problem. That by the early 1980s the Soviets could destroy 90 percent of the ICBM force with a small fraction of their force and that was really the... The argument then came about the window of vulnerability, when would it take place and what should be done about it.

Interviewer: WHAT WAS THE WINDOW?

Van Cleave: Well the window of vulnerability as I began using the term and I think Mr. Nitze began using it about the same time. I don't know who really coined it to begin with. It might have been someone else. But we began using it, particularly after the B Team and when we began debating SALT II as part of the Committee on the Present Danger. You can view the term from a more narrow sense to a broader sense. In its most narrow sense it referred specifically to the impending ICBM vulnerability. A vulnerability of the entire ICBM force to relatively small fraction of the Soviet force. In a broader view, something that's often forgotten, and certainly the Scowcroft Commission forgot it, is that it referred overall to the vulnerability of American strategic deterrent forces and their command and control communications. We were as worried about bomber vulnerability, and C-Cubed vulnerability, and the possibility of sometime in the future, submarine vulnerability, at the time. So the window of vulnerability really referred on a broader sense to all land-based force vulnerability. In the next sense it sort of referred to an overall strategic vulnerability of the United States that would take place when Soviet strategic forces had this asymmetrical counterforce capability, plus the strong, secure force. Just the gross imbalance in forces. It seemed to us to be a window of vulnerability. So it...we used it in all three senses. But clearly when it began, when I began writing in to Mr. Reagan's statements in 1979, it referred most specifically to ICBM vulnerability.

Interviewer: ASKS NITZE SCENARIO FOR HOW SOVIETS COULD TAKE ADVANTAGE OF THE VULNERABILITY.

Van Cleave: Well the scenario is a commonplace scenario. It's one that's been recognized by the Department of Defense, going way back to the '60s. You can see it laid out in the Safeguard debate of '69, '70, '71, Harold Brown described it in his Defense Department reports to Congress every year. And that was the scenario where there would be a well timed, coordinated attack on the land-based forces by some combination of Soviet ICBMs and SLBMs that at the same time would take out probably the early warning systems, the command and control systems. We, this scenario was even willing to say, okay, all the submarines at sea survive. But then after that first strike which takes out all of American capability against time-urgent hardened targets or non-time-urgent hardened targets, the United States is left with X number of warheads at sea, which are useful only against soft point targets, which is a force we don't want to use, that we want to keep in reserve. And facing that is an overwhelming Soviet residual force of ICBMs, SLBMs and bombers, supported by active and passive defenses. A situation where if the strike were successfully carried out in the first place, most of us who have thought it over felt that a President probably would not retaliate or if he did it would be more symbolic retaliation. And we felt that this would not be a credible deterrent, that whatever the increase in the risks of the surprise attack taking place, it certainly increased the risks in foreign policy and decision making.

Interviewer: DIDN'T SCOWCROFT QUESTION THIS SCENARIO?

Van Cleave: The Scowcroft Commission said something a little bit different than that I think. The Scowcroft Commission apparently didn't believe in a sure destruction at that time, of all-out retaliation. What they said was that a coordinated attack would be so difficult that our ICBM forces, as well as many of our bombers could launch on warning. The Scowcroft Commission solution was a launch on warning or at best a launch under attack solution. Up to the time of the Scowcroft Commission, everybody, including Harold Brown and William Perry and those of us on the opposite side of the political aisle, shunned at all costs a launch on warning or launch under attack, court of last resort much less a strategy, because of the obvious difficulties with it. Technically, operationally, strategically, intelligence, and so forth. So the Scowcroft Commission did a couple of things in this regard. It said that we could ... first of all acknowledged ICBM vulnerabilities. Since the Soviets now possess the combination of numbers, accuracy and reliability to destroy our ICBM force with a small fraction of its force. It then said, however, that that in itself was not sufficient problem to drive ICBM modernization. That's totally contrary to what the entire community believed up to that point in time. Totally contrary to what people like Harold Brown who served with the committee said in his, in his previous statements. And they said besides that, we'll get early warning of the attack and can launch on warning. That a coordinated attack is too difficult. Well, the coordinated attack problem is debated all the way back to the Safeguard debate and everybody, including Harold Brown in his 1979 report to Congress, said that while the coordinated attack is difficult, it is not impossible and we can't ignore that particular risk. So the Scowcroft Commission sort of turned that around. Earlier in 79 Harold Brown and Perry were telling Congress that our bombers became more vulnerable because of ICBM vulnerability and the Scowcroft Commission ignored that as well. And then it did one other thing that I think is potentially is a very serious blow to sound strategic logic in the United States. It turned the concept of Crisis Stability on its head. Originally Crisis Stability was an additional standard for force effectiveness. Strategic

stability said in the old days of the sixties that there won't be a surprise attack because we can always retaliate with at least a submarine force. Crisis stability says now wait a minute. Still, you have to worry that even with a submarine force, at a time of crisis, if your other forces are strategically important and vulnerable, then the enemy's incentive to attack will be increased. And since the, according to the logic of that time, the only real chance of an exchange was in a crisis anyway. It was particularly in a crisis that we must assure that all major segments of the forces were survivable. That none of them, and particularly the ICBM force which is far and away the most important key to American strategy, at least since NSDM-242 in 1974. Certainly key to PD-59. Without a survivable ICBM force American strategic doctrine falls apart with the speed of light. Crisis stability understood that. Now the Scowcroft Commission uses Crisis Stability to reduce the standards for force effectiveness. It says, according to Crisis Stability that, first of all, there won't be a surprise attack. We will come out of a crisis. Because of that our bombers and ICBMs will be more alert and we can launch on warning. Therefore we don't have to worry about ICBM vulnerability, at least not for the next ten years, it said. Because remember the report said, "Yeah, it's a problem and we'd better fix it in the '90s with a small ICBM. But we can live with it in the '80s." But as everybody knows the Scowcroft Commission's assignment was to justify the MX program to Congress and not to come up with sensible solutions for vulnerability.

Interviewer: IN THE 1980 CAMPAIGN HE SERVED AS SENIOR DEFENSE ADVISOR FOR REAGAN. ASKS WHAT THEY HAD IN COMMON IN SENSE OF WHAT NEEDED TO BE DONE?

Van Cleave: In 1980 I took a leave of absence from the University to serve as the senior defense advisor for Mr. Reagan and defense policy coordinator. Dick Allen was the national...

Interviewer: (INTERRUPTIONS REPEATS QUESTION)

Van Cleave: In 1980 I took a leave of absence from the university to be senior defense advisor for Ronald Reagan during the campaign. And coordinator of defense policy. Early on in the spring of 1980 when the newspapers were trying to say that the former Governor of California didn't know anything about foreign defense policy, Richard Allen and I set up an advisory group of experts, scanning foreign and defense policy. A hundred and some, about half of which were in defense. In the spring of '80, at that time, I suggested to Mr. Reagan that in addition to working on the campaign and the speeches, I'd put these people to work. That I'd take the defense experts, organize them into task forces, appoint chairmen, and then I'd chair the overall group. And we'd study these problems. On these task forces I used people that had been instrumental in something called the Strategic Alternatives Team. The Strategic Alternatives Team was set up about 1978 under my chairmanship, consisting of a group of policy experts like Paul Nitze, top scientists like Bill Graham, top engineers like Ben Plymale then vice president of Boeing, and others. Because we were so concerned with the vulnerability problem and with our conviction that the Administration was not addressing it seriously enough and that its solutions to it would not be timely enough. We set ourselves up to study quicker solutions, principally to the vulnerability problem. But to strategic force modernization overall. I brought most of that team into the campaign in 1980 and from the spring of 1980 up to the time of the election, we did an enormous amount of analytical work and studies and the like. And really had tentative solutions already decided upon. We held our own hearings, we had our own working groups and the like. The idea that I proposed at the time was that we could get 75 percent of the work done on a Reagan 8-year defense program by the time of the election and really be able to hit the ground running. That I would then agree to be Director of the Department of Defense transition team, between the Carter and the Reagan Administrations, which I was. And bring the professional people in who had helped me both in the Strategic Alternatives Team and doing these studies of 1980, into the Pentagon to complete the work. By turning it from unclassified into classified, by doing the necessary negotiating with the services, and saying here's what we have come up with, what's your reaction to it? Do you support it? Do you disagree? If you disagree, why do you disagree? Let's go back and address the problem again.

Interviewer: ASKS ABOUT BASING MODES FOR MX: HE TOLD CANDIDATE REAGAN IT WAS NOT GOOD TO SUPPORT....

Van Cleave: We had two problems with the Carter basing mode for MX. The basing mode, that is to say. One was the timing plan for development and deployment of the system didn't come soon enough. Mr. Reagan announced in a major speech in Chicago on March 1980, this system isn't timely enough. We'll be faced with the window of vulnerability, we need a system to provide survivability more rapidly. The other thing is that because the Carter Administration had changed the system to adapt it to then SALT II negotiations, it had changed in specific ways that we were critical of, without being critical of the concept of multiple protective shelters.

Interviewer: ASKS ADVICE TO REAGAN ON BASING.

Van Cleave: Well the advice I gave Mr. Reagan and the position that Mr. Reagan took throughout 1980 was that we were critical, not of multiple protective shelter basing but of the Carter MX plan, for two reasons. One it would not provide the necessary survivability rapidly enough. It was too slow a system. Mr. Reagan first said in March of 1980 in Chicago that this system does not solve the window of vulnerability problem rapidly enough. We need something that does it more quickly than now planned. Secondly the Carter Administration had by '79, '80, changed the system to adapt it to SALT II requirements in ways that made the system too cumbersome, too costly and too uncertain. And we were critical of those specific changes in the system.

Interviewer: WHAT FEATURES DID THEY ADD?

Van Cleave: Well in the first place, keep in mind that all of the community agreed that for various reasons vertical shelters were far the best. They carried the, the least technical risk, the least uncertainty in the pricing...

Interviewer: INTERRUPTS FOR FORMAT DISCUSSION WHAT WAS WRONG WITH CARTER MPS?

Van Cleave: The Carter version was that it had changed the original concepts of the system. For example, from vertical shelters which all studies to that time, Defense Science Board, Air Force Science Board and outside contractors, had all agreed by that time that austere vertical shelters were far preferable for any multiple protective shelter or as it was originally called, multiple aim point system. The reason being that they could be built cheaper, they were harder, they carried less technical risk, they carried less cost uncertainty, and the point here was that particularly with an MX, 192,000 pounds, when with a canister and transporter would be a million pounds, really could not be a mobile missile. And you therefore had to have location uncertainty. Vertical shelters with random occasional movement rather than mobility was what everyone agreed was the best or the most optimum solution at that time, if one ruled out defense.

Interviewer: WHY DID THE CARTER ADMINISTRATION CHANGE THE SYSTEM?

Van Cleave: As the Carter Administration was planning this multiple protective shelter and negotiating SALT II, the Committee on the Present Danger, particularly Mr. Paul Nitze but also myself and a couple of others, pointed out that there seemed to be an inconsistency here. The Carter Administration was negotiating an agreement that would rule out the very system it said was necessary for MX. The Carter Administration denied that. We kept pressing the point. At this point in time, and I believe 1979, the Carter Administration sent over to Geneva, I believe Mr. Vance at the time, to tell Mr. Semenov, the head of the Soviet delegation, sort of the following: "It is our interpretation of the SALT II agreement that this system is not ruled out and is not inconsistent with

of the Soviet delegation, sort of the following: "It is our interpretation of the SALT II agreement that this system is not ruled out and is not inconsistent with the agreement." What the Carter Administration hoped was that the emissary would go there, make the statement, turn around and come home. And following the curious American negotiating doctrine that Soviet silence means Soviet assent, everything would be alright. But the Soviet says "No, wait a minute, sorry, that's inconsistent with what you are negotiating." The Carter Administration said but, the agreement, once the protocol expires, doesn't rule out mobile ICBMs. The Soviet says, "Yeah, you're right. Mobile ICBMs a great idea. We like mobiles, we're going to have mobile ICBMs but you're not building a mobile ICBM. You're talking about building thousands of launchers." By that point in time, the silo launcher in the ground vertical was identified as a launcher for SALT counting purposes. And at least in American eyes as a missile. And if the Soviets wanted to cause trouble about this, which they did, all our argument... that this is not a launcher it's a protective shelter, could be used and was used. It's ironic because the Soviets don't necessarily use silo launchers as anything other than protective shelters. All of their ICBMs themselves come in canisters. And we should have from the earliest days of SALT I point out that these things aren't launchers, that we really don't know what a launcher is and it's stupid to limit launchers anyway. But we didn't do that. We were in that trap. Here are the Soviets saying that building all of these shelters was the same thing as building new launchers and that was prohibited. And this isn't a truly mobile system. And besides that, how can we verify it? The Carter Administration went back, took the volti...excuse me, the vertical shelters that looked like silo launchers, put them above ground, made them horizontal shelters or garages, and then tried to add much more mobility to the system, coming in with Racetrack and stuff like that. So you had horizontal shelters which were more costly and not nearly as hard, and you had a mobile system for a missile and its transporter which were too large for a mobile system. And then you introduced new problems with preserving location uncertainty. And to top all that off the Carter Administration put SALT viewing parts, ports on top of the horizontal shelters which would be open when the Soviet satellite went over so they could see which shelters held the missile. Which wasn't our idea of location uncertainty. It was those kinds of things that I think degraded the original concepts that we criticized. But we did not, we did not criticize multiple protective shelter at any time during '79 or '80.

Interviewer: CITES AIR FORCE RESERVATIONS. ASKS IF HE TALKED WITH GENERALS BURKE OR HECKER ABOUT THE PROBLEM.

Van Cleave: Well in '79 or '80 and even into '81, we had constant interaction with Air Force officials such as General Burke and General Hecker. And I was a great admirer of both men who were superb professionals and looked at this problem objectively. It's entirely correct to say that neither they nor for that matter Lew Allen favored the changes in the system that the Carter Administration made. But nonetheless they found themselves then in a bind. It was to take this system and make the best of it or risk not have any ICBM modernization at all. Or what would be even worse I believe in those gentlemen's eyes, having the MX put in Minuteman silos rather than in some type of survivable basing scheme. I think they felt it was preferable to the alternatives and they turned out to be correct, and that it would be possible to improve it as you went along.

Interviewer: WHAT DID HE SAY TO THE GENERALS?

Van Cleave: We felt that we were going to win the election in 1980 and we could make changes in it that would improve it and do it much more rapidly than the Carter Administration planned. We also felt that his system was by then so flawed that it was most unlikely either to solve the survivability problem or to get through Congress. My arguments with Gen. Burke and Gen. Hecker and the Air Force had to do again with the timing of solutions to the problem. I was recommending strongly and so did my transition team that we have an interim solution of redeploying Minuteman III in multiple protective shelters in existing Minuteman deployment areas. And then phasing MX in probably a lesser deployment in terms of numbers into those areas. And proceeding with rapid deployment of a small ICBM. The Air Force clearly preferred to stay with MX only.

Interviewer: DURING THE BILL MOYERS DEBATE HE WAS SEEN AS OPPOSING MOVING SYSTEM TO UTAH. WHY DID HE GO AHEAD AND ENCOURAGE PEOPLE TO FIGHT THIS FORM OF THE SYSTEM?

Van Cleave: Well we felt that time again, make it clear that...the MX was really the wrong missile for the United States. We felt that it was a missile that would be too difficult to adapt to a sufficiently survivable basing mode. And that it would be better to take the existing force that we had, which was a good force, the Minuteman III, upgrade it and redeploy it in a far more survivable mode. We at that point in time felt that there was sufficient time and probability to do that that we should push on that even at the risk that it might cause for MX at the time.

Interviewer: SO HE DID REALLY BACK THE STRUGGLE OF PEOPLE IN UTAH/NEVADA AGAINST THIS BASING SYSTEM?

Van Cleave: No, that's not quite correct to say. Because in the final analysis I thought particularly when there's further delay in rebasing Minuteman III, that we, if we were going to have the MX, and I was a supporter all the time of Minuteman, of ICBM modernization and increased counter-force capabilities and the like, that if we were going to have it, we had to have some time of a multiple shelter basing. My strategic alternative team and my group of experts up through the transition, still felt that it was probably a mistake to try to propose to put this system into new areas when we had six wings of Minuteman deployment scattered all around the country, encompassing about 200,000 square miles where people were used to having ICBMs. And where particularly, if you had the original MPS concept with vertical shelters, you could include in those existing deployment areas, and, or, on other military reservation. We had then 30,000 square miles of fenced military reservations available as well. And it was really, again, the MX missile that was driving the basing. Rather than the other way around.

Interviewer: WHY DID HE FEEL THE BIG MISSILE REMAINED UNCHANGED THROUGH DESIGN PHASES AND THE BASING MODE CHANGED?

Van Cleave: The Air Force has had an interest in larger missiles for cost effectiveness reasons going back in the 1960s. Given the threat as defined in the late '60s, and throughout the early to middle 1970s, then there wasn't anything intrinsically wrong with a large missile in fixed shelters. The larger missile was also a product of SALT. When you began counting and limiting the numbers of things, i.e., launchers or missiles, you increased the pressure to make bigger and bigger things. As well as cost effectiveness and re-entry vehicle deployment reasons do as well. Strategic logic would have counseled producing the same capability but scattering it into a larger number of smaller packages, which packages were individually less lucrative and less attractive targets or aim points, and could be made more survivable through both proliferation and mobility. Mobility and concealment become almost exponentially more difficult as the size of the missile and its associated equipment increase. And therefore we, we were against that because of survivability. I think the Air Force wanted it for SALT reasons because they wanted a larger missile, because by that time the MX was the only ICBM under development and they were afraid of losing it. And because they felt that if you let them work the problem they could solve the vulnerability problem adequately.

Interviewer: DID HE RECOMMEND TO REAGAN THAT HE CONSIDER REDEVELOPING MISSILE ALONG SMALLER LINES AND MAKING IT MORE MOBILE?

Van Cleave: We had different phases of what we were recommending because we were trying to be realistic about it and we certainly wanted Air Force cooperation as much as we could get. By the time of the transition we had a three-pronged approach to the problem. One was as I said, redeployment of Minuteman III, in multiple shelters in existing deployment areas. The second was continued development of the MX missile for adaptation into that same MX, MPS deployment, but probably in lesser numbers than the 200 planned by the Carter Administration. And the third was concurrent, rapid deployment of

the single warhead, small ICBM. Which would be adaptable to a larger number of survivability measures from mobility to concealment. Those were the three approaches that we were recommending. Now you can see readily with the first and the third, the second wasn't needed... It just wasn't needed. But it was partly a concession to the Air Force and partly it was a hedge against some unforeseen failure, technical or political, in the development of the small ICBM.

Interviewer: IS HE SAYING, IF WE COULD HAVE DEVELOPED A SMALL MOBILE MISSILE, THEN MX WAS UNNECESSARY?

Van Cleave: That MX was not only unnecessary. If we could do those two things, redeploy Minuteman III and develop the small ICBM expeditiously, MX would be a bad idea.

Interviewer: SALT GOT IN THE WAY FOR US STRATEGICALLY. DID HE FEEL WE SHOULD ABANDON SALT AND GO AHEAD TO DO WHAT WAS UNILATERALLY BEST FOR US?

Van Cleave: SALT certainly got in the way of solving the survivability problem for ICBMs. Keep in mind that SALT either prohibited or was biased against essentially every way that I know of to have a survivable land-based ballistic missile force. First of all, it limited your numbers. That is, it prevented proliferation of aim points and increased the value inevitably, of each aim port. Secondly the SALT ABM treaty says you can't defend them against ballistic missile defense. Thirdly, for verification reasons, you couldn't conceal them without going to an enormous amount of difficulties such as was in the MPS system, and fourthly, also for verification reasons, it was the American position in SALT, from the earliest days of SALT I to this very day in the Reagan Administration, that mobile ICBMs should be banned. Now if you can't proliferate aim points, if you can't defend, if you can't conceal, and you can't make them mobile, I don't know how to make ICBMs survivable. And that's been a product of SALT.

Interviewer: ASKS ABOUT GOVERNORS SCOTT MATHESON AND ROBERT LIST.

Van Cleave: At the time of the Bill Moyers debate in Salt Lake City on MX and MX basing, the governors of the two states involved, Bob List of Nevada and Scott Matheson of Utah were still rather favorable towards MX deployment in their states, as I recall. Gov. Matheson was of course perceptive to social objections and to what the Mormon Church's position would be, but Robert List was still looking at it as a very potential economic boom to the state of Nevada and was not at that time opposing it. It shows that the political situation can change when there's a very determined and articulate minority making dramatic if not outrageous claims about the consequences of deployment.

Interviewer: SENATOR GARN SAYS LAXALT AND HE TURNED REAGAN AGAINST THE SYSTEM.

Van Cleave: Jake Garn and Paul Laxalt probably had a lot to do with persuading Mr. Reagan and Mr. Weinberger that by 1980 it was not a good idea to put the system in their states as envisaged at the time. I had many discussions with both Jake Garn and Paul Laxalt and I found them quite willing to consider alternative deployment modes that were not as disruptive as that planned by the Carter Administration. Paul Laxalt on the other hand was quite in sympathy with my urging about Minuteman redeployment and my suggestion that a lesser deployment of Minuteman could be phased into a multiple protective shelter system around the Cheyenne, Wyoming, Air Force Base.

Interviewer: ASKS IF IT'S IRONIC THAT CARTER WOULD GIVE MX MISSILE TO PEOPLE, PARTICULARLY FROM THE COMMITTEE ON THE PRESENT DANGER TO GET SALT II RATIFIED—AND THEN REALLY GOT NOTHING.

Van Cleave: Well I don't think, I don't think it was a matter of the Carter Administration giving opponents of SALT II the MX missile. Because the MX missile would not have relieved one bit our opposition to SALT II. And in fact, most of us had reservations about the MX missile. I think that the responsible people in the Carter Administration like Secretary Brown and Dr. William Perry, by that time, themselves felt something had to be done about ICBM vulnerability and also favored improving the capability of the force.

Interviewer: SHOULD WE HAVE BUILT THE LARGEST MISSILE WE COULD UNDER THE SALT RULES? HAVE AS MUCH TARGET COVERAGE AS POSSIBLE?

Van Cleave: If we were to be bound forever and ever to SALT rules, then there is a lot to be said about building the largest lightweight ICBM and SS-19 size ICBM, which is the MX, that the rules will allow. We badly needed increased counterforce and increased ICBM capability, or we couldn't either carry out our own doctrine or have essential equivalence with the Soviet Union. In that case, however, we either needed ballistic missile defense of those larger missile systems, or we needed to get back to a sensible multiple protective shelter system. My own preferred solution would have been to do away with limits on launchers or aim points, and even limits on missiles, and look at such thing as overall throw weight limits on capability. So you agreed on what ceilings or capability you would have, but then the sides were left to adapt those forces to the best survivable mode that they could find. And in my view that would have been the same capacity, the same increased counter-force capability, but divided up among a large number of very small missiles that could be either concealed or made mobile or if necessary also defended.

Interviewer: HOW WAS WEINBERGER'S PHILOSOPHY DIFFERENT FROM YOURS — YOU WERE SLATED TO HIS JOB...

Van Cleave: The... I'm not sure there's a difference in philosophy between myself and the new Secretary of Defense, Caspar Weinberger. On the one hand there is a bureaucratic difference that for a year, plus the transition, I had been organizing the Reagan defense plan and a lot of people in the building, Pentagon, and outside of it, were sort of looking at me as if I were Secretary of Defense. I never expected to become Secretary of Defense. I knew I didn't have the political experience or anything else. That was one problem. The other problem, the real problem was that as fine a man as Mr. Weinberger is and as great his service in government, he simply simply was not experience in defense problems and in such matters as ICBM survivability.

Interviewer: WHAT MISTAKE DID HE MAKE?

Van Cleave: The mistake made by Mr. Weinberger was sort of several fold.... The mistake made by Mr. Weinberger was several fold. First of all, he didn't have the background and knowledge to tackle the problem expeditiously and he sought to buy time bureaucratically by forming one study panel such as the Townes Panel after another, all the way to the Scowcroft Commission, to restudy a problem that had already been studied more than any single defense problem in my knowledge, and didn't need any more study. Secondly, a priori, he rejected the multiple protective shelter. For whatever set of reasons, I'm not entirely certain. Perhaps politically he was convinced that it wouldn't work in Utah and Nevada. Perhaps he was convinced that we opposed the system in 1980. Ronald Reagan really didn't oppose the basing scheme and we didn't oppose the missile either, although none of us were very enthusiastic about it. But nonetheless, Mr. Weinberger would not consider any discussion of the multiple protective shelters from day one. He wouldn't even listen to the Joint Chiefs of Staff or the Air Force on the problem. What he did was say, in essence, now fellows, that I have ruled out, the only two known ways to make the MX survivable, ballistic missile defense and multiple shelters, come up with another solution. And the MX, and the Air Force and OSD cast around for one thing after another, and came up, predictably, with one very bad idea after the other, from the C-5A or Big Bird air mobility, to dense pack and closely spaced basing to what have you. And then finally shrugged their shoulders and went right back to 1977 and the Carter Administration and stuck them in Minuteman

silos.

Interviewer: DID HE TRY TO CONVINCE WEINBERGER TO LOOK AT THE FACTS?

Van Cleave: I tried on several occasions to brief Cap Weinberger about all the work that we had done on the entire strategic force modernization program, and particularly on the problem of ICBM vulnerability and the options among Minuteman II, MX, and the small ICBM. Mr. Weinberger was not interested at the time of his appointment, and before inauguration day, in hearing those briefings. Either at the Pentagon or when my deputy, Dr. Plymale and I flew to San Francisco. He was interested in the threat briefings that we brought along and was very attentive to those. He was not interested in the options that we had by that time formulated, or our preferred on those options. It was my idea to present him the options, tell him which ones the services favored, if they were different, from which ones his transition team favored. And ... lay them out that way. He would not listen to those. I then tried to guide him and his representatives, such as Mr. Taft, to the written materials that we had formulated, the boxes of materials. We had large briefing books that laid out all of these options in exquisite detail. I am not aware that any of that team looked at any of those materials in any way whatsoever. Later on Mr. Plymale and I finished a summary report of what we did and I personally delivered that to Mr. Carlucci. I am not aware that anyone paid any attention to that either. When it became clear as 1981 was going on, and the Air Force was beginning to get very worried about the new Administration, when it became clear that they weren't moving to resolve the problem in any way whatsoever, I prepared a couple of written memorandums and took them to Richard Allen and to Ed Meese. And we had discussions of the problem and I got absolutely nowhere.

Interviewer: ASKS HIM TO REPEAT ANSWER, CONCENTRATING ON BASING QUESTION.

Van Cleave: Well the problem here is that I didn't have a chance to outline any of the options for ICBM survivability for Mr. Weinberger because he wouldn't take the time to listen to them.

Interviewer: HE WOULDN'T LISTEN TO MULTIPLE PROTECTIVE SHELTER SYSTEM?

Van Cleave: I had the strong feeling in the meetings I had after Cap Weinberger was appointed Secretary of Defense, up to the time when the transition team was dissolved and Mr. Weinberger didn't care to hear of any of the options or recommendations or solutions that we had come up with.

Interviewer: DID HE REGRET HAVING COMING OUT AGAINST THE MPS EARLIER? IF THEY HAD USED THE CARTER SCHEDULE YOU MIGHT HAVE HAD 200 MISSILES BASED SURVIVABLY?

Van Cleave: By October of 1981, when the Reagan Administration announced strategic force modernization program, and announced having the number... halfing the number of MX missiles and putting them in Minuteman silos, I certainly did feel that the Carter Administration approach was far preferable to that without any shadow of a doubt whatsoever. And by that period of time, as a matter of fact, right about that time, I gave an address to the professional community in Washington, D.C., at a semi-annual defense form meeting, where I went over these particular options. And at that time explained why I didn't favor the things that were being discussed, but did make the point that I felt something was far better than nothing. That we badly needed an ICBM development, a modernization program, and at that point of time any movement in the direction of survivability was infinitely preferable than just putting things in silos. Also at that point of time I remember meeting Harold Brown at a lunch at the Committee on the Present Danger where Dr. Brown was sort of kidding me about wasn't the Carter Administration approach to this far better than what the Reagan Administration had come up with. And I had to acknowledge that yes, indeed, it was.

Interviewer: WASN'T THAT HARD BECAUSE THE AIR FORCE HAD SAID IN 1979 NOT TO OBJECT TO THIS BECAUSE WE WON'T GET A SYSTEM?

Van Cleave: The Air Force's position was indeed that if we pushed the other types of options, such as Minuteman redeployment and the small ICBM, that we would likely lose the MX program. As it turned out that wasn't quite correct because we didn't get the MX program either. And we don't have the MX program now that the Air Force envisioned then.

Interviewer: WHAT WAS HIS TAKE ON THE SCOWCROFT COMMISSION REPORT?

Van Cleave: By 1982 I had become persuaded that the MX missile was the problem. And I was writing Op-Ed pieces and the like, saying that the Reagan Administration adopted the Carter missile which was a bad idea, and threw out the Carter basing scheme which was a good idea. But that now the Reagan Administration had the opportunity to come up with the Reagan missile and a Reagan basing scheme, and it was called the small ICBM adapted to multiple protective shelter or other options of mobility. And by that time I was saying again that the MX was the problem. I wrote a major piece in the Washington Post in December of 82 on that which led to my being summoned as one of the ... initial witnesses before the Scowcroft Commission. I spent a good deal of time testifying and answering their questions, and I believe I was partly responsible for persuading them of the wisdom of a small, single RV, ICBM program. As a matter of fact, I got an early copy of their report inscribed to me by one of the members, Jim Woolsey, you know, with the inscription, "With thanks for the main idea." And at that point of time I was feeling strongly that we really needed a crash program on small ICBM.

Interviewer: WHERE DID THE IDEA ORIGINATE?

Van Cleave: The small ICBM is an idea that has floated around for a long period of time. It was something that various elements of the scientific and policy community have been interested in. Paul Nitze had been interested in it for a number of years. People at R-D Associates on the West Coast, had been interested. It's just an idea that had been around for a long period of time.

Interviewer: WHAT ABOUT THE ARGUMENTS THAT IT'S JUST TOO EXPENSIVE?

Van Cleave: Well I don't believe the small ICBM is too expensive. But what we're listening to here when we're listening to these costs, we're listening to the Air Force. Which wants to protect the MX. Now any system, particularly since the Air Force and its contractors have a monopoly on ICBM research and development and procurement, any system can be made to look as arbitrarily costly and to take as much time as they wanted to look at. And then when you add the fact that the government bureaucracy in DOD anyway can make any simple problem exceedingly difficult, and any difficult problem virtually impossible to solve, you can string out the time and the costs. I think this hit its peak when during the transition the Air Force attempted unsuccessfully to tell the transition team that it would take longer and cost more to take a missile we already had, redeploy it in existing deployment areas where the infrastructure existed, where the political community accepted it, than it would to develop a brand new missile, the MX, put it in an entirely new area, and solve all the environmental and engineering problems. That was absolutely absurd.

Interviewer: WHY HAS THE AIR FORCE STALLED ON THIS, AND WHY?

Van Cleave: The Air Force in my view as an institution has undoubtedly been stalling on the small ICBM or the Midgetman. But it has also lost favor, partly because of Air Force actions toward it in the office of the Secretary of Defense. There are really three contributing factors to the problems with the small

ICBM today. First of all the Scowcroft Commission, not wanting it to interfere with the MX, made it an 1990s initial operating capabilities system. A 1990s system. When I testified to the Scowcroft Commission, with all the expert support I had behind me, I testified that there was no reason that we couldn't have that system beginning deployment within four years. That was the end of '82, start of '83. That is to say in 1987 to at most beginning 1988 system. There is no reason to call it a 1992 system unless the Scowcroft Commission was under instructions to preserve the MX and not use this to be a... an alternative to the MX or a competitor to it. The Air Force by that time was institutionally dedicated to the MX missile and saw the small ICBM also as a competitor. That doesn't mean the entire Air Force. No doubt the small ICBM program officers have been devoted to the small ICBM. And the... and SAC has also been in favor of the small ICBM because there is a lot to be said for targeting purposes. For a single warhead missile rather than a large MIRVed missiles. So there have been pockets of support in the Air Force. But at the highest levels the Air Force has not been favorable to the small ICBM. To give it unfavorable comparison with the MX, they have come up with cost effectiveness techniques based upon the number of warheads carried per unit cost. Rather than the true comparison, which is how many survivable warheads do we have and what's the cost of a survivable warhead, not the cost of a warhead in peace, for heaven's sake. Nobody's ever used that for anything. But those kinds of comparisons coupled with assumptions about SALT limitations on the number of small ICBMs have driven the unit cost of the small ICBM to a point where it has to be unattractive. If you're really talking about 300 small ICBMs, and you are using a calculation based on cost per warhead, then it's going to be unattractive to me.

Van Cleave: The small ICBM as it's been developed by the Air Force has become an unattractive system for many in the Office of Secretary of Defense. Because they feel it will be too costly, the numbers will be too low, and that given the Air Force's approach on cost effectiveness calculations, it makes more sense to have a MIRVed small ICBM. But a MIRVed small ICBM means two things. First of all it means a growth in the missile weight. And a growth in the missile weight means an even greater growth in the weight of the overall transporter or erector launcher package. Every pound of growth in the weight of the missile means about 8 pounds growth in the weight of the transporter and canister and things for that missile. When you begin to make a MIRV out of it, you've taken what was originally a 25,000 missile and then a 33 and then a 38, and you're up to close to Minuteman-sized missile, 60 to 70,000 pounds. That becomes more difficult to make mobile and more difficult to conceal and it also becomes more costly. Secondly, however, there were many strategic reasons for a single warhead vehicle. Ranging from reducing the attractiveness of the target, changing the strategic exchange ratio so the enemy expends more warheads than he gets of ours. And because there are many targeting reasons to have small or single re-entry vehicles rather than MIRVed. But now OSD, knowing all of those things, has now become dis-enamored, if that's the right word, of the small ICBM. And is in fact against it.

Interviewer: HOW DOES HE FEEL ABOUT HML?

Van Cleave: I don't believe that the HML... I don't believe that the hardened mobile launcher is the right way to go for a small ICBM, I think it adds far too much weight and far too much cost to what should have been kept a very simple and austere system. The small ICBM, if it were kept small enough, like 25,000 or 30,000 pounds, or with the 10 years it's taking to develop it, technology could probably give you a 18,000 to 20,000 pound ICBM with a thousand pound warhead, without any trouble at all. If you'd kept it small you could have adapted it to a greater variety of mobile configurations. The hard mobile launcher adds too much weight to do that, and I think probably the best thing would be to take the small ICBM and adapt it to a multiple protective shelter system. In that regard I'd do two things. I would make austere vertical shelters on the fenced military reservations for the prime deployment. And then I'd add a large number of even cheaper, possible even horizontal shelters outside the military reservation. To which the system could scatter if it did receive enough warning to do so.

Interviewer: WHY DID THE AIR FORCE PUSH THE HML?

Van Cleave: I don't know why the Air Force is pushing the hard mobile launcher. I've seen Air Force design studies that support it in an engineering fashion. And I'm sure that many of the Air Force officers working on it have become convinced that the hard mobile launcher is the best solution to barrage types of threats and the like. Also, they are operating on a couple of assumptions. One, off the road mobility is a non-starter politically, and secondly, multiple protective shelters wouldn't get past the Secretary of Defense who to recently was Cap Weinberger. So if you ruled out off the road mobility, and you ruled out multiple protective shelters, and you're talking about making a system mobile or quasi mobile in the land areas that are being discussed, then the hard mobile launcher can be said to make sense. I wouldn't rule out the other two things. I would in fact try and return to them.

Interviewer: WAS THE AIR FORCE DOING THAT TO SABOTAGE...

Van Cleave: I would also add that I do have my suspicions that many in the Air Force do favor the hard mobile launcher because it helps make the small ICBM look less attractive and more costly.

Interviewer: SHOULD THE SCOWCROFT COMMISSION HAVE KILLED THE MX AND MOVED AHEAD WITH THE SMALL MISSILE?

Van Cleave: I firmly believe that the Scowcroft Commission would have done far greater service to the national security of the nation if it had recommended that the Reagan Administration scrap the MX and had recommended a crash program to develop and deploy the small ICBM.

Interviewer: ASKS HOW HE FEELS ABOUT MXS IN SILOS.

Van Cleave: It makes me very uncomfortable to have MXs stuck in silos. I am entirely for more capable ICBM forces. But survivability comes first and all along survivability has been the number one priority. And it's as simple as that. We can't have major increases in capability without commensurate improvements in survivability.

Interviewer: WEINBERGER SAYS HE SAW WINDOW OF VULNERABILITY AS NOT JUST NEEDING TO PROTECT OUR MISSILES BUT WE NEEDED TO MATCH PERCEPTUALLY THE OFFENSIVE CAPABILITY OF THE SOVIETS. THE MX IN SILOS THEN DOES THAT.

Van Cleave: I have no problem with Mr. Weinberger's description of the term window of vulnerability as including essential equivalence and perceptual equivalence with Soviet capabilities. In the broadest sense I would agree that that should be encompassed by the term. But that in itself is no reason to put MX missiles in vulnerable configurations. You're not, you're not building weapons, you're building targets if you do that. You're not improving essential equivalence at all. You're destabilizing a situation, it seems to me.

Interviewer: ASKS HIM TO REPEAT ANSWER.

Van Cleave: With his definition. If I were to take my original definition of window of vulnerability one step farther and broadening it, I would say yes, essential equivalence. I would say, as a matter of fact, being able to accomplish the objectives that we have set for our strategic forces which includes essential equivalence.

Interviewer: ASKS HIM TO REPEAT PART OF ANSWER.

Van Cleave: [illegible] with Cap Weinberger's [illegible] ability [illegible] essential [illegible] with the Soviet Union. And

Van Cleave: I had no quarrel with Cap Weinberger's window of vulnerability broadly enough to encompass essential equivalence with the Soviet Union. And I certainly believe the United States should attempt to match Soviet counterforce capability and that increased ICBM capabilities are necessary to do that. But that in itself is no reason to put these capabilities in a vulnerable configuration. That's not adding weapons, it's adding targets. And it doesn't help essential equivalence to do it in that fashion.

Interviewer: SCOWCROFT COMMISSION SAID WINDOW OF VULNERABILITY HAD BEEN WAY OVER EMPHASIZED. THAT WE DON'T HAVE TO WORRY ABOUT FOR A DECADE OR SO.

Van Cleave: The Scowcroft Commission said that the window of vulnerability exists today but that it had been over emphasized for a decade. That it was not itself sufficiently important to be thee driving factor for ICBM modernization. I think the Scowcroft Commission was dead wrong and I think that really reflects the truth that the Scowcroft Commission's charter was to come up with an MX package that would be persuasive to Congress.

Interviewer: WHY WAS IT SO IMPORTANT TO BUILD MX?

Van Cleave: Why was it so important to build that particular MX? Because there was strong commitment to it. Reagan was committed to the MX by that point in time, the Air Force was committed to the MX. And there were sound reasons for proceeding with an ICBM development program. We hadn't deployed a new ICBM for a number of years. Soviet ICBM forces were far surpassing those of the United States in every measure of capability. My only problem here is that the window of vulnerability and ICBM survivability have indeed been the foremost strategic problems facing our strategic forces for a number of years, and increasingly so. And I think the Scowcroft Commission did a very poor job of rationalizing, or attempting to rationalize that problem away.

Interviewer: FIRST YOU FOMENTED CRITICISM OF CARTER MPS SYSTEM; LATER YOU CAME TO SEE IT WAS THE BEST SOLUTION AND ARGUED ITS CASE TO WEINBERGER?

Van Cleave: I criticized the Carter multiple protective shelter because I think that it had itself become a degraded system compared to the sounder concepts for multiple protective shelters. I also criticized it because at that time I was persuaded as were many others that there were in fact alternatives to that program that were viable politically, that were a far more timely solutions to the vulnerability problem, and that were technically and operationally superior to that particular plan. Had I known at the time, or had the problem been defined to me at that time, as this or nothing, I would certainly have preferred that to nothing.

Interviewer: DANIEL GRAHAM SAID MPS WAS DESIGNED TO SOAK UP THE VERY SOVIET WEAPONS THAT SHOULD BE THE PRIME TARGETS FOR MX IN A COUNTERFORCE ROLE.

Van Cleave: Danny Graham's statement about this being a system to soak up Soviet RVs, I think was really one made to enforce his own preferred view that we spend more of our money on ballistic missile defense isn't on defensive forces than these offensive forces. And on that principle I certainly agree with Gen. Graham that we should spend more money on ballistic missile defenses and strategic defenses. But the purpose of a, of a survivability scheme or basing scheme for an ICBM force is, is distorted if it's phrased as a way to soak up things. What it's, what it's there for is to increase attack requirements, thereby multiply uncertainties and reduce the incentives for, for attack. It's there to deter attack on the system.

Interviewer: DOES HE FIND SURVIVABILITY OF MX MORE IMPORTANT THAN LARGE NUMBER OF TARGET COVERAGE CAPABILITY?

Van Cleave: There are two reasons to modernize the ICBM force. Both of them are important. One is survivability and the other is increased capability. As important as increased capability is, it is not more important than survivability.

Interviewer: ASKS IF AIR FORCE FAVORED CAPABILITY, CONGRESS FAVORED SURVIVABILITY.

Van Cleave: I think it's entirely true that the Air Force has always put increased capability before survivability because they've already spent more time and money working on the missile than on the basing scheme. That was the case with MX, and it's the case now with the small ICBM.

Interviewer: ASKS HOW HE FEELS ABOUT RAIL GARRISON PROPOSAL.

Van Cleave: The rail garrison proposal is one that, if I had any alternatives to it, that I was attracted to. That if the Administration told me that it's willing to deploy a ballistic missile defense of MX or any other portion of the ICBM force, that I would reject. But I certainly think it's preferable to putting MX in Minuteman silos.

Interviewer: BUT HIS PREFERENCE IS...

Van Cleave: My preference would be to go with the small ICBM and/or with ballistic missile defense, than with the MX and a rail garrison mode, without any shadow of a doubt. The rail garrison mode at least does something for survivability beyond just putting the things in the Minuteman silo. But it is still a system that depends upon strategic warning for its survivability.

Interviewer: ASKS IF BOLT OUT OF THE BLUE IS REALISTIC SCENARIO.

Van Cleave: I think the only prudent planning factor is the surprise attack. It's the only one that makes sense. Even if one were to argue and to believe that a surprise attack has near zero probability because the only scenario in which one could imagine a Soviet attack would be one growing out of a crisis. Simply because our forces are inherently more survivable if they're on generated alert, and in a crisis mode, any Soviet decision to attack would probably include attempts to stand down from a crisis situation so that the attack in effect would be a surprise attack. When you add to that the very great political, psychological likelihood that information of an attack would be information more resisted by American decision makers than any other information of value... imaginable. Then surprise attack becomes technically at least as likely if not more likely than an attack with warning.

Interviewer: ASKS HOW HE ACCOUNTS FOR THE CHANGE: THE ADMINISTRATION HAS TAKEN A TOTALLY DIFFERENT DIRECTION FROM WHAT HE HAS RECOMMENDED.

Van Cleave: Well I can't really account except for reasons that have been explained, why the Reagan Administration took a position on ICBM programs far different than I had recommended or that the transition team had recommended, or that its own strategic forces of 1980 had recommended, except to say that to Mr. Weinberger was adamantly determined not to pay any attention to the recommendations of those particular groups and of myself.

Interviewer: ASKS WHY HE SAID IN 1976 HE WOULD PREFER TO TAKE THE SOVIET FORCES TO OURS.

Van Cleave: I don't remember the date, but you're probably correct that as long as ten years ago in Congressional testimony I did say that if there were a

possibility of trading Soviet strategic nuclear force...trading American strategic nuclear forces for Soviets, we'd be better off and I'd make the swap at that point of time. I saw Soviets strategic nuclear forces already possessing the potential far to surpass those of the United States in the capabilities essential to meeting our own strategic doctrine. Besides the fact that it was the American strategic forces that were being made vulnerable by the Soviet strategic forces, and not the Soviet strategic forces that were being made vulnerable by American strategic forces. So on the Soviet side you had at once a more capable force, or at least in potential, and a far more survivable, or less vulnerable force.

Interviewer: DOES HE THINK THE SOVIETS WOULD TRY TO LAUNCH AN ATTACK THAT TOOK OUT MOST OF OUR KEY MILITARY ATTRIBUTES AND NOT EXPECT US TO COUNTER?

Van Cleave: I think it's entirely credible that we should plan on the basis of the Soviet attack, counterforce attack, reserving strong residual forces to try and dissuade any American response. Whatever one believes about the credibility of such a scenario, any prudent strategic planner must base his planning on that kind of scenario and that kind of assumption. For years, since we've had ICBM forces, the planning scenario agreed upon by every Administration was that of a well-executed surprise attack. The term well executed surprise attack has been used by every Secretary of Defense since Mr. McNamara and including Mr. Brown. That was the planning factor deemed prudent for judging the survivability and efficiency of our strategic forces, and there seemed to me to be very sound reasons for doing so. It may well be that the Soviet Union would always be deterred from waging such an attack because of the possibility of some type of measurable American retaliation. One doesn't know. But in any type of strategic analysis today, we've gotten to a position as Mr. Brzezinski and other have publicly acknowledged, where the uncertainties surrounding a hypothetical Soviet surprise attack are far less than the uncertainties associated with an American retaliation.

Interviewer: CITES SCOWCROFT COMMISSIONS VIEW.

Van Cleave: The Scowcroft Commission did rationalize its position by saying that not the uncertainty so much but the difficulties of a coordinated attack on all land-based forces, coupled with the surviving forces at sea, would be not a very satisfactory or comfortable but an adequate deterrent for this decade. Only.

Interviewer: IS A SURPRISE ATTACK CREDIBLE?

Van Cleave: A surprise attack to me is not only a credible scenario, I'm not judging the probability of it, but it is a credible scenario because it's the one that makes the most sense strategically, it's the one that best fits into Soviet doctrine and mentality, and it's the one from which an attacker could expect to derive the most. More than the question of credibility which is judgmental, it's the only sensible planning factor. It's the only prudent scenario upon which one should base strategic force planning and one's evaluation of the sufficiency of your strategic deterrent forces. Every Secretary of Defense since Robert McNamara, indeed since we've had land-based ballistic missiles, has used the term "well executed surprise attack" as a kind of threat against which we have to design the survivability of our forces. And I believe that that's sound.

Interviewer: WHY NOT GIVE UP LAND-BASED ICBMS BECAUSE THEY ARE HARD TO MAKE SURVIVABLE?

Van Cleave: Giving up land-based ICBMs because of the difficulties of making them adequately survivable, has been an option that many people have recommended and an option that has been discussed for a long period of time. The logic behind it says, Why not give up the type of system that is at once the most threatening and at the same time the most vulnerable. That kind of logic of course presupposes a strategic arms limitation agreement where both sides would agree to do that. Since we know the Soviet side is not going to do that, the only question becomes "Should the United States unilaterally give up an ICBM force because we have found it too difficult to make it adequate survivable?" My own preference would be to say No to that because I believe we can make one adequately survivable because the ICBM is absolutely critical to current American strategic doctrine and policy. To relinquish it would at least require major changes in that doctrine. And because there are many attributes an ICBM have that are in its favor, such as low operations and maintenance, sounder communications, and everything like that. But if you really posed the question as "Can we only have a vulnerable and essentially inadequate ICBM force?" then of course I have to reconsider what the alternatives are to that. I would prefer to keep an ICBM force and to work on making it survivable.

Interviewer: WHY DID MX BECOME SUCH A CAMPAIGN ISSUE FOR REAGAN IN 1980?

Van Cleave: The MX was a big campaign issue for Ronald Reagan in 1980 because strategic force modernization and inadequacy of defense programs were a big issue and the ICBM was just part of that. At the time, in 1980, we were emphasizing the overall inadequacy of defense programs and defense budgets. We were emphasizing that strategic force modernization was still taking 8 percent or less of the defense budget at a time when the strategic balance was shifting radically in favor of the Soviet Union and more must be done there. And then finally the window of vulnerability began to focus attention on the MX and ICBM problem. But if you look back at the Republican platform in Detroit of 1980, or at any of the statements that Mr. Reagan made on defense, the ICBM wasn't singled out for extra attention or focus. It was just part of a lot of things that we were saying needed to be done. We were making strong recommendations at the time on everything from the B-1 to better pay for military personnel and increased readiness.

Interviewer: DID YOU CAMPAIGN ON THE ISSUE OF THE WINDOW OF VULNERABILITY — AND THEN DO NOTHING ABOUT IT?

Van Cleave: The candidate who campaigned on the window of vulnerability not only did not proceed to close that window of vulnerability, but opened it wider.

VaxGen
VaxGen was a biopharmaceutical company based in the San Francisco Bay Area.
Founded in 1995 and based in South San Francisco, California, the company was engaged in the development of vaccines that immunize against infectious disease, notably AIDS. On July 28, 2010, VaxGen Inc. was acquired by diaDexus, Inc. in a reverse merger transaction.;[1] diaDexus filed for bankruptcy in 2016.[2] VaxGen, Inc. does not have significant operations.
AIDSVAX
Anthrax vaccine
References
External links
In the 1990s, VaxGen developed and began trials of an AIDS vaccine called AIDSVAX. The National Institute of Allergy and Infectious Diseases (NIAID) worked with Vaxgen when Vaxgen was developing its AIDS vaccine. Specifically, NIAID and Vaxgen worked together on research projects related to the body's immune response to the vaccine. As of 1998, according to NIAID, "The threeyear study [of AIDSVAX] is the first large-scale trial of an HIV preventive vaccine, and will involve 5,000 volunteers at about 40 clinical sites in North America."[3]
However, in 2003, it was announced that the preliminary trials of the vaccine, conducted in Thailand and North America, had been unsuccessful.[4][5] The company's analysis of its results, which resulted in some potentially positive outcomes among patient subgroups, was criticized by statisticians as inappropriate.[6]
Vaxgen had focused its recent efforts on a new form of Anthrax Vaccine, for which it was awarded a $877 million contract to provide the vaccine under the Project Bioshield Act.[7] In December 2006, HHS unilaterally withdrew the $877 million contract, sending the stock tumbling as low as $1.20 per share.

(Russia) State Research Center of Virology and Biotechnology (VECTOR)

Wikipedia State Research Center of Virology and Biotechnology (VECTOR)

Saved Wikipedia

See [HK001Z][GDrive] Live - https://en.wikipedia.org/wiki/State_Research_Center_of_Virology_and_Biotechnology_VECTOR

The **State Research Center of Virology and Biotechnology VECTOR**, also known as the Vector Institute (Russian: Федеральное бюджетное учреждение науки «Государственный научный центр вирусологии и биотехнологии „Вектор“» федеральной службы по надзору в сфере защиты прав потребителей и благополучия человека (ГНЦ ВБ «Ве́ктор»)), is a biological research center in Koltsovo, Novosibirsk Oblast, Russia. It has research facilities and capabilities for all levels of Biological Hazard, CDC Levels 1–4. It is one of two official repositories for the now-eradicated smallpox virus,[1][a] and was part of the system of laboratories known as the Biopreparat.

Recently the facility has been upgraded and secured using modern cameras, motion sensors, fences, and biohazard containment systems. Its relative seclusion makes security an easier task. Since its inception there has been an army regiment guarding the facility.[2][1]

The facility has, at least in Soviet times, been a nexus for biological warfare research (see Soviet biological weapons program), though the nature of any ongoing research in this area is uncertain.

History

This section needs expansion. You can help by adding to it. (March 2020)

Organized in 1974, the center has a long history of virology, making impressive Soviet contribution to smallpox research.[3] Genetic engineering projects included creation of viruses that manufacture toxins as well as research on bioregulators and various peptides that function in the nervous system.[4] In the post-soviet times the center made research and development cotributions in many projects like a vaccine for Hepatitis A, influenza vaccines, vaccines for the Ebola virus,[5] antiviral drugs with nucleotide analogs,[6] test-systems for diagnostics of HIV and Hepatitis B and other development.[7]

In March 2020 it was reported that Russian scientists have begun to test vaccine prototypes for the new coronavirus disease, with the plan of presenting the most effective one in June, a laboratory chief at Vector Institute said. The prototypes have been created and the testing on animals began.[8]

Tasks

The main tasks of the Center according to Vector:

Basic research of causative agents of especially dangerous and socially important viral infections, and their genetic variability and diversity, pathogenesis of viral infections.

Ensuring constant readiness for implementing diagnostics of especially dangerous infectious agents.

The development and introduction into healthty practice of diagnostic curative and preventive medicines.

Post-graduate training, and scientific training of higher qualification in the field of Virology, molecular biology and biotechnology through graduate school and higher education.

Accidents

In 2004 a researcher at VECTOR died after accidentally pricking herself with a needle contaminated with the Ebola virus.[9]

Fifteen years later, on September 17, 2019, a gas explosion occurred at Vector. One worker suffered third-degree burns, and the blast blew out window panes. The lab has highly contagious forms of bird flu and strains of hepatitis.

2019 (Sep) - LAB BLAST Gas explosion tears through Russian bio-weapons lab containing smallpox, Ebola and HIV virus sparking ‘major emergency’

https://www.thesun.co.uk/news/9943121/gas-explosion-rips-russian-laboratory-smallpox-ebola-plauge-anthrax/

A GAS explosion and ensuing fire has ripped through a Russian "bio-weapons" laboratory where the world's most infectious viruses are stored.

The State Research Centre of Virology and Biotechnology has said a cylinder exploded in a lab, which is one of two places in the world to stockpile smallpox.

Russian media have reported that the “the situation was quickly upgraded from an ordinary emergency to a major incident”.

Following the blast, one worker was left with third degree burns. Further details are unclear.

The risk to the public from biological contamination has been downplayed.

Russian state media reported the facility’s head “emphasising the incident does not pose any biological or any other threat to the population”.

The fire was caused by the explosion of a gas canister but "no work with biological materials was going on there", a statement from the lab said.

MAJOR INCIDENT

The incident follows numerous blasts in nuclear and conventional weapons bases in the past few months.

On August 8 a deadly explosion at ballistic nuclear missile testing range near Nyonoksa, north-western Russia caused a spike in radiation levels and sparked the evacuation of a nearby village.

Officials claimed that no radiation had been released, although the city administration in Severodvinsk reported a rise in radiation levels – a contradiction that recalled Soviet-era cover-ups of disasters like Chernobyl.

On August 5, huge explosions and mushrooms clouds were witnessed nearby a weapons base in Kamenka, Siberian region of Krasnoyarsk

On July 1 a "blast" aboard a Russian nuclear "spy" submarine killed 14 crew members.

The plant is one of two places in the world, where the smallpox disease is stored.

The other place is at a high-security laboratory which is called the US centre for Disease Control in Atlanta.

2005 (May 25) - Russian Scientist Dies in Ebola Accident at Former Weapons Lab (NY TImes article)

See [HN00RP][GDrive]

A **Russian scientist** at a former Soviet biological weapons laboratory in Siberia has died after accidentally sticking **herself** with a needle laced with ebola, the deadly virus for which there is no vaccine or treatment, the lab's parent Russian center announced over the weekend.

Scientists and officials said the accident had raised concerns about safety and secrecy at the State Research Center of Virology and Biotechnology, known as Vector, which in Soviet times specialized in turning deadly viruses into biological weapons. Vector has been a leading recipient of aid in an American program to help former Soviet scientists and labs convert to peaceful research.

Although the accident occurred May 5, Vector did not report it to the World Health Organization until last week. Scientists said that although Vector had isolated the scientist to contain any potential spread of the disease and there was no requirement that accidents involving ebola be reported, the delay meant that scientists at the health agency could not provide prompt advice on treatment that might have saved her life.

The first public mention of the accident was over the weekend on Pro-Med, the informal Internet reporting and discussion network of doctors and other health care professionals, which posted the Vector account of the laboratory accident on its Web site (www.promedmail.org)

American experts said the accident had not occurred in a lab now receiving United States government or private money for research.

While officials at Vector said the scientist, Antonina Presnyakova, was working on an ebola vaccine, they have declined to identify who was financing the research or discuss its specific nature.

Terry Fredeking, the president and founder of Antibody Systems, a Texas-based company, said that while his company had spent more than $150,000 in the last five years on joint research on ebola at Vector, the accident did not involve research he was financing. "It's sad and somewhat frightening," said Mr. Fredeking, "that Vector didn't inform the W.H.O. or even its own lab directors that the accident had occurred in time for us to offer help."

Ronald Atlas, a biodefense expert at a center at the University of Louisville, in Kentucky, said that while it was important to work on vaccines to protect against deadly viruses, the accident showed the danger. "It shows we must be careful about what we are doing, as well as where and with whom we are doing it," said Dr. Atlas, in an interview here at the American Society for Microbiology's annual meeting.

An American scientist was involved in a similar accident with ebola at the Army's leading biodefense lab at Fort Detrick, Md., several months ago. But she did not contract the disease. The lab disclosed the accident within 48 hours, officials said.

Vector is also one of two repositories of the deadly smallpox virus -- the other is the Centers for Disease Control and Prevention in Atlanta. Since the Soviet Union collapsed, the United States has spent millions of dollars to help convert such places to peaceful research, including an estimated $10 million at Vector.

Critics of the program have opposed expanding such aid because it is hard to verify whether former Soviet scientists are using the American-supported research for peaceful purposes. But the program's defenders say it keeps scientists employed on peaceful projects and prevents them from working for anti-American states or terrorists seeking biological weapons.

verizon.com

Verizon Communications Inc. is an American multinational telecommunications conglomerate and a corporate component of the Dow Jones Industrial Average.[10] The company is based at 1095 Avenue of the Americas in Midtown Manhattan, New York City,[4] but is incorporated in Delaware.

In 1984, the United States Department of Justice mandated AT&T Corporation to break up the Bell System into seven companies, each a Regional Bell Operating Company (RBOC), commonly referred to as "Baby Bells". **Bell Atlantic**,[11] one of the Baby Bells, came into existence the same year, consisting of the separate operating companies New Jersey Bell, Bell of Pennsylvania, Diamond State Telephone, and C&P Telephone, with a trading area from New Jersey to Virginia.

As part of a rebranding of the Baby Bells in the mid-1990s, all of Bell Atlantic's operating companies assumed the holding company's name. In 1997, Bell Atlantic expanded into New York and the New England states by merging with fellow Baby Bell NYNEX. Bell Atlantic was the surviving company name, and the merged company moved its headquarters from Philadelphia to NYNEX's old headquarters in New York City. In 2000, Bell Atlantic acquired GTE, which operated telecommunications companies across most of the rest of the country that was not already in Bell Atlantic's footprint. Bell Atlantic, the surviving entity, changed its name to Verizon, a portmanteau of *veritas* (Latin for "truth") and *horizon*.[12]

In 2015, Verizon expanded into content ownership by acquiring AOL,[13][14] and two years later, it acquired Yahoo!.[15] AOL and Yahoo were amalgamated into a new division named Oath Inc.,[16] currently known as Verizon Media. As of 2016, Verizon is one of three remaining companies with roots in the former Baby Bells. The other two, like Verizon, exist as a result of mergers among fellow former Baby Bell members. SBC Communications bought the Bells' former parent AT&T Corporation and took on the AT&T name, and Lumen Technologies (formerly Century Link) acquired Qwest (formerly US West) in 2011.

As of April 2019, Verizon's subsidiary Verizon Wireless is the second largest wireless communications service provider in the United States, with 153.1 million mobile customers.[17] And as of 2017, Verizon is the only publicly traded telecommunications company to have two stock listings in its home country, both the NYSE (principal) and NASDAQ (secondary).[18] As of 2017, it is also the second largest telecommunications company by revenue after AT&T.[19]

History[edit]

Bell Atlantic (1983–2000)[edit]

Bell Atlantic Corporation was created as one of the original Regional Bell Operating Companies (RBOCs) in 1984, during the breakup of the Bell System.[20]

[21] Bell Atlantic's original roster of operating companies included:

- The Bell Telephone Company of Pennsylvania[22]
- New Jersey Bell[23]
- Diamond State Telephone[24]
- C&P Telephone[24] (itself comprising four subsidiaries)[25]

Bell Atlantic originally operated in the states of New Jersey, Pennsylvania, Delaware, Maryland, West Virginia, and Virginia, as well as Washington, D.C.[24]

In 1996, CEO and Chairman Raymond W. Smith orchestrated Bell Atlantic's merger with NYNEX.[26] When it merged, it moved its corporate headquarters from Philadelphia to New York City.[26] NYNEX was consolidated into this name by 1997.[27]

Merger of equals (2000–2002)[edit]

Verizon's former logo used from May 19, 1998 to September 1, 2015

Bell Atlantic changed its name to Verizon Communications in June 2000, when the Federal Communications Commission approved the US$64.7 billion Merger with telephone company GTE, nearly two years after the deal was proposed in July 1998.[28] The approval came with 25 stipulations to preserve competition between local phone carriers, including investing in new markets and broadband technologies.[28] The new entity was headed by co-CEOs Charles Lee, former CEO of GTE, and Bell Atlantic CEO Ivan Seidenberg.[28]

Verizon became the largest local telephone company in the United States, operating 63 million telephone lines in 40 states.[29] The company also inherited 25 million mobile phone customers.[29] Additionally, Verizon offered internet services and long-distance calling in New York, before expanding long-distance operations to other states.[28][30]

The name Verizon derives from the combination of the words *veritas*, Latin for truth, and horizon.[31] The name was chosen from 8,500 candidates and the company spent $300 million on marketing the new brand.[31][32]

Two months before the FCC gave final approval on the formation of Verizon Communications, Bell Atlantic formed Verizon Wireless in a joint venture with the British telecommunications company Vodafone in April 2000.[32][33][34] The companies established Verizon Wireless as its own business operated by Bell Atlantic, which owned 55% of the venture.[33] Vodafone retained 45% of the company.[33] The deal was valued at approximately $70 billion and created a mobile carrier with 23 million customers.[32][33] Verizon Wireless merged Bell Atlantic's wireless network, Vodafone's AirTouch and PrimeCo holdings, and the wireless division of GTE.[33][35][36] Due to its size, Verizon Wireless was able to offer national coverage at competitive rates, giving it an advantage over regional providers typical of the time.[32]

During its first operational year, Verizon Wireless released Mobile Web, an Internet service that allowed customers to access partner sites such as E*Trade, ABC News, ESPN, Amazon.com, Ticketmaster, and MSN,[34] as well as the "New Every Two" program, which gave customers a free phone with every two-year service contract.[37] In another partnership with MSN in 2002, Verizon Wireless launched the mobile content service VZW with MSN and a phone that utilized the Microsoft Windows operating system.[38]

In August 2000, approximately 85,000 Verizon workers went on an 18-day labor strike after their union contracts expired.[39][40] The strike affected quarterly revenues,[41] resulting in Verizon Wireless' postponement of the company's IPO[41] (the IPO was ultimately cancelled in 2003 because the company no longer needed to raise revenue for Verizon Wireless due to increased profits),[42] and created a backlog of repairs.[40] This strike did not involve all company employees, as mostly line technicians and user technicians of the company are union.

Verizon launched 3G service in 2002, which doubled the Internet speeds of the time to 144kb a second.[43] In August 2002, Verizon began offering local, long-distance and mobile calling, as well as Internet service, in a bundle. It was initially only available to customers in New York and Massachusetts.[30]

2003–2005[edit]

In June 2003, Verizon Wireless backed an FCC-issued portability requirement that permitted consumers to take their phone numbers with them across carriers.[44] The company gained 1.5 million new subscribers the following quarter, partially due to the rule change.[45] In April 2004, the Dow Jones Industrial Average added Verizon Communications to its stock market index.[46] Verizon replaced telecom competitor AT&T, which had been a part of the index since the Great Depression.[46]

On December 22, 2004, mail servers at Verizon.net were configured not to accept connections from Europe by default in an attempt to reduce spam email that was originating from the region. Individual domains would only be unblocked upon request.[47]

In 2004, Verizon launched its Fios Internet service, which transmits data over fiber optic cables, in Keller, Texas.[48][49] The company launched Fios TV in September 2005, also in Keller. Twenty percent of qualified homes signed up by the end of 2004.[50] By January 2006, Fios offered over 350 channels in eight states, including 20 high-definition television channels as well as video on demand.[50]

MCI acquisition

In 2005, Verizon began negotiations to purchase long-distance carrier MCI, who accepted the company's initial $6.75 billion offer in February but then received a higher offer from Qwest Communications. Verizon increased its bid to $7.6 billion (or $23.50 a share), which MCI accepted on March 29, 2005.[51] The acquisition gave the company access to MCI's million corporate clients and international holdings, expanding Verizon's presence into global markets.[51][52] As a result, Verizon Business was established as a new division to serve the company's business and government customers.[53] The FCC approved the deal on November 5, 2005, valuing it at $8.5 billion.[54] Verizon's 2006 revenues rose by as much as 20% following the purchase.[55]

2006–2010[edit]

In May 2006, *USA Today* reported that Verizon, as well as AT&T and BellSouth, had given the National Security Agency landline phone records following the September 11 attacks.[56][57] That same month, a $50 billion lawsuit was filed by two lawyers on behalf of all Verizon subscribers for privacy violations and to prevent the company from releasing additional records without consent or warrant.[56][57] Protesters staged the National Day of Out(R)age due in part to the controversy.[58] In 2007, Verizon stated that it fulfilled only "lawful demands" for information,[59] but also acknowledged surrendering customer information to government agencies without court orders or warrants 720 times between 2005 and 2007.[60]

In March 2007, Verizon was a lawsuit against Vonage for patent infringement. The three patents named were filed by Bell Atlantic in 1997, and relate to the

In March 2007, Verizon won a lawsuit against Vonage for patent infringement. The three patents named were filed by Bell Atlantic in 1997, and relate to the conversion of IP addresses into phone numbers, a key technology of Vonage's business.[61] The company was awarded US$58 million in damages and future royalties.[61] Vonage later lost an appeal and was ordered to pay Verizon $120 million.[62]

In May 2007, Verizon acquired Cybertrust, a privately held provider of global information security services.[63]

In September 2007, Verizon Wireless reversed a controversial decision to deny NARAL Pro-Choice America a short code through which the organization could text consumers who had signed up for messaging from the group. The company had initially refused the group access to a code by reserving the right to block "controversial or unsavory" messages.[64]

In November 2007, Verizon opened its networks to third party apps and devices for the first time,[65] a decision that allowed it to participate in the FCC's 2008 700 MHz auction of "open access" spectrum.[65][66] During that auction, the company bid $9.4 billion and won the bulk of national and local licenses for airwaves reaching approximately 469 million people.[66][67] Verizon utilized the increased spectrum for its 4G service.[66]

In June 2008, Verizon Wireless purchased wireless carrier Alltel for $28.1 billion. The acquisition included 13 million customers, which allowed Verizon Wireless to surpass AT&T in number of customers and reach new markets in rural areas.[68]

In October 2010, Verizon Wireless paid $77.8 million in refunds and FCC penalties for overcharging 15 million customers for data services. The company stated the overcharges were accidental and only amounted to a few dollars per customer.[69][70]

On February 4, 2010, 4chan began receiving reports from Verizon Wireless customers that they were having difficulties accessing the site's image boards. Administrators of the site found that only traffic on port 80 to the boards.4chan.org domain was affected, leading them to believe the block was intentional. On February 7, 2010, Verizon Wireless confirmed that 4chan.org was "explicitly blocked"[71] after Verizon's security and external experts detected sweep attacks coming from an IP address associated with the 4chan network. Traffic was restored several days later.[72]

In August 2010, the chairmen of Verizon and Google agreed that network neutrality should be defined and limited.[73][74]

In December 2010, Verizon introduced its 4G LTE network in 38 markets, as well as airports in seven additional cities. The company planned on a three-year continuous expansion of the 4G service.[75]

Selling wirelines (2005–2010 & 2015)[edit]

Between 2005 and 2010, Verizon divested wireline operations in several states to Frontier in order to focus on its wireless, Fios internet and Fios TV businesses.[55] It sold 700,000 lines in Hawaii in 2005,[55][76] and spun off lines in Maine, New Hampshire and Vermont in January 2007, which were then purchased by FairPoint Communications for $2.72 billion.[55] Verizon also shed its telephone directory business in 2006.[77]

In May 2009, the company spun off wirelines in Arizona, Idaho, Illinois, Indiana, Michigan, Nevada, North Carolina, Ohio, Oregon, South Carolina, Washington, West Virginia, and Wisconsin into a company that then merged with Frontier Communications in a deal valued at $8.6 billion.[78][79] In 2016, Verizon sold its wireline operations in Texas, Florida, and California to Frontier.[80]

2011–present[edit]

On January 27, 2011, Verizon acquired Terremark, an information technology services company, for $1.4 billion.[81] Ivan Seidenberg retired as Verizon's CEO on August 1, 2011, and was succeeded by Lowell McAdam.[82]

In December 2011, the non-partisan organization Public Campaign criticized Verizon for its tax avoidance procedures after it spent $52.34 million on lobbying while collecting $951 million in tax rebates between 2008 and 2010 and making a profit of $32.5 billion. The same report also criticized Verizon for increasing executive pay by 167% in 2010 for its top five executives while laying off 21,308 workers between 2008 and 2010.[83] However, in its Form 10-K filed with the SEC on February 24, 2012, Verizon reported having paid more than $11.1 billion in taxes (including income, employment and property taxes) from 2009 to 2011. In addition, the company reported in the 10-K that most of the drop in employment since 2008 was due to a voluntary retirement offer.[84]

In June 2012, Verizon purchased Hughes Telematics, a producer of wireless features for automobiles, for $612 million as part of its strategy to expand into new growth areas in its wireless business.[85] The same month, Verizon's E-911 service failed in the aftermath of the June 2012 derecho storm in several northern Virginia suburbs of Washington, D.C., with some problems lasting several days.[86] The FCC conducted an investigation[86] and released a report detailing the problems that led to the failure in January 2013. Verizon reported that it had already addressed or was addressing a number of the issues related to the FCC report, including the causes of generator failures, conducting audits of backup systems, and making its monitoring systems less centralized,[87] although the FCC indicated that Verizon still needed to make additional improvements.[88]

In July 2012, the FCC ruled that Verizon must stop charging users an added fee for using 4G smartphones and tablets as Wi-Fi hotspots (known as "tethering"). Verizon had been charging its customers, even those with "unlimited" plans, $20 per month for tethering. As part of the settlement, Verizon made a voluntary payment of $1.25 million to the U.S. Treasury.[89]

In August 2012, the Department of Justice approved Verizon's purchase of Advanced Wireless Services (AWS) spectrum from a consortium of cable companies, including Comcast, Time Warner Cable and Bright House Networks, for $3.9 billion.[90] Verizon began expanding its LTE network utilizing these extra airwaves in October 2013.[91]

On June 5, 2013, *The Guardian* reported it had obtained an order by the Federal Bureau of Investigation (FBI) and approved by the United States Foreign Intelligence Surveillance Court that required Verizon to provide the NSA with telephone metadata for all calls originating in the U.S.[92][93] Verizon Wireless was not part of the NSA data collection for wireless accounts due to foreign ownership issues.[94]

In September 2013, Verizon purchased the 45% stake in Verizon Wireless, previously owned by Vodafone, for $130 billion.[95] The deal closed on February 21, 2014, and became the third largest corporate deal ever signed, giving Verizon Communications sole ownership of Verizon Wireless.[96]

On January 14, 2014, the DC Circuit Court of Appeals struck down the FCC's net neutrality rules after Verizon filed suit against them in January 2010.[97][98] In June 2016, in a 184-page ruling, the United States Court of Appeals for the District of Columbia Circuit upheld, by a 2–1 vote, the FCC's net neutrality rules and the FCC's determination that broadband access is a public utility rather than a luxury. AT&T and the telecom industry said they would seek to appeal the decision to the Supreme Court.[99]

On January 28, 2014, the Wall Street Journal reported that Verizon was charging more than 1,200 companies for information about its subscribers' online activities.

On January 22, 2014, the *Wall Street Journal* reported that Verizon received more than 1,000 requests for information about its subscribers on national security grounds via National Security Letters. In total, Verizon received 321,545 requests from federal, state and local law enforcement for U.S. customer information.[100] In May 2015, Verizon agreed to pay $90 million "to settle federal and state investigations into allegations mobile customers were improperly billed for premium text messages."[101]

In late October 2014, Verizon Wireless launched the technology news website SugarString. The publication attracted controversy after it was reported that its writers were forbidden from publishing articles related to net neutrality or domestic surveillance. Although Verizon denied that this was the case, the site (described as being a pilot project) was shuttered in December.[102][103]

In August 2015, Verizon launched Hum, a service and device offering vehicle diagnostic and monitoring tools for vehicles.[104] On August 1, 2016, Verizon announced its acquisition of Fleetmatics, a fleet telematics system company in Dublin, Ireland, for $2.4 billion, to build products that it offers to enterprises for logistics and mobile workforces.[105] On September 12, 2016, Verizon announced its acquisition of Sensity, a startup for LED sensors, in an effort to bolster its IoT portfolio.[106]

In October 2016, Verizon was accused by Communications Workers of America of deliberately refusing to maintain its copper telephone service. The organization released internal memos and other documents stating that Verizon workers in Pennsylvania were being instructed to, in areas with network problems, migrate voice-only customers to VoiceLink, a system that delivers telephone service over the Verizon Wireless network, and not to repair the copper lines. VoiceLink has limitations, including incompatibility with services or devices that require the transmission of data over the telephone line, and a dependency on a battery backup in case of power failure. The memo warned that technicians who do not follow this procedure would be subject to "disciplinary action up to and including dismissal". A Verizon spokesperson responded to the allegations, stating that the company's top priority was to restore service to customers as quickly as possible, and that VoiceLink was a means of doing so in the event that larger repairs had to be done to the infrastructure. The spokesperson stated that it was "hard to argue with disciplining someone who intentionally leaves a customer without service".[107][108]

In November 2016, Verizon acquired mapping startup SocialRadar, whose technology would be integrated with MapQuest.[109]

On January 26, 2017, the *Washington Post* reported that Verizon was in talks to merge with Charter Communications.[110]

In 2017, Verizon partnered with Alley to develop a number of coworking spaces under the name "Alley powered by Verizon".[111][112][113]

On March 13, 2017, Verizon was sued by New York City for violating its cable franchise agreement, which required the provider to pass a fiberoptic network to all households in the city by June 30, 2014. Verizon disputed the claims, citing landlords not granting permission to install the equipment on their properties, and an understanding with the government that the fiber network would follow the same routes as its copper lines, and did not necessarily mean it would have to pass the lines in front of every property.[114]

On April 27, 2017, Verizon invested $10 million in Renovo Auto, an autonomous vehicle company based in Campbell, California.[115]

Verizon Connect was created in 2018, combining the individual Telematics, Fleetmatics, and Telogis units.[116][117][118]

On January 17, 2019, Verizon announced that it would offer anti-spam and robocalling features free of charge to all its customers beginning in March.[119][120]

In April 2019, Verizon began rolling out its 5G mobile network, which was active in 30 cities by the end fo the year.[121][122] Unlike other U.S. carriers, Verizon only uses millimeter-wave (mmWave) spectrum for its 5G network.[123] While capable of very high speeds, mmWave has limited range and poor building penetration.[124][125]

On May 15, 2020, Verizon acquired videoconferencing service BlueJeans in order to expand its business portfolio offerings, particularly its unified communications offerings. While the price of the acquisition was not announced, it is believed to be in the sub $500 million range.[126] The transaction is expected to close in the second quarter of 2020.[127] In September of the same year, the business announced it plans to acquire TracFone Wireless (a business unit of Mexican telecom business, America Movil) for $6.25 billion.[128]

In October 2020, Verizon collaborated with Apple to bring 5G connectivity to Apple's iPhone 12 lineup.[*citation needed*]

Acquisition of AOL and Yahoo[edit]

On May 12, 2015, Verizon announced it would acquire AOL at $50 per share, for a deal valued around $4.4 billion.[129][130] The following year, Verizon announced it would acquire the core internet business of Yahoo! for $4.83 billion.[15][131][132] Following the completion of the acquisitions, Verizon created a new division called Oath, which includes the AOL and Yahoo brands.[16] The sale did not include Yahoo's stakes in Alibaba Group and Yahoo! Japan.[133][134]

On March 16, 2017, Verizon announced it would discontinue the e-mail services provided for its internet subscribers and migrate them to AOL Mail.[135]

On May 23, 2017, Verizon CEO Lowell McAdam confirmed the company's plan to launch a streaming TV service.[136] The integrated AOL-Yahoo operation, housed under the newly created Oath division, would be organized around key content-based pillars.[137]

On June 13, 2017, Verizon completed its acquisition of Yahoo for $4.48 billion.[138]

Verizon service van

On December 10, 2018, Verizon announced that 10,400 managers had agreed to leave the company as part of a "voluntary separation program" offered to 44,000 employees, resulting in a cut of around 7% of its workforce. At the same time, the company announced a $4.6 billion write-off on its media division, citing "increased competitive and market pressures throughout 2018 that have resulted in lower-than-expected revenues and earning."[139]

Finances[edit]

For the fiscal year 2019, Verizon reported earnings of US$19.265 billion, with an annual revenue of US$131.868 billion, an increase of 0.77% over the previous fiscal cycle. Verizon's shares traded at over $45 per share, and its market capitalization was valued at over US$229.1 billion in October 2018.[140] As of 2018, Verizon is ranked No. 16 on the Fortune 500 rankings of the largest corporations in the United States by total revenue.[141]

Marketing campaigns[edit]

Since its inception, Verizon Communications has run several marketing campaigns, including:

Can you hear me now?[edit]

The "Can you hear me now?" campaign, which was created for the newly formed Verizon Wireless, started running in 2001, and featured actor Paul Marcarelli in the role of "Test Man", a character based on a Verizon network tester, who travels the country asking "Can you hear me now?".[142][143][144] The campaign, originally conceived by New York agency Bozell, ran from early 2001 to September 2010.[145][146] Data from the technology tracking firm The Yankee Group showed that, in the early years of the campaign, net customers grew 10% to 32.5 million in 2002 and 15% more to 37.5 million in 2003. In addition, customer turnover dropped to 1.8% in 2001, down from 2.5% in 2000.[144] In 2011, Marcarelli parted ways with Verizon, and is now a spokesperson for Sprint.[147]

There's a map for that[edit]

The "There's a map for that" campaign was launched in late 2009, designed as a parody of AT&T's "There's an app for that" campaign. The ads depicted a side-by-side comparison of Verizon and AT&T network coverage maps.[148] In early November 2009, AT&T filed a lawsuit in Atlanta federal court, claiming that the coverage maps being used in the ads were misleading.[149] The suit was dropped later that month in conjunction with Verizon dropping a similar suit against AT&T.[148]

That's not cool[edit]

In 2009, Verizon joined with the Ad Council, in partnership with the Family Violence Prevention Fund and the Office on Violence Against Women, to create the "That's not cool" public service advertising campaign. Designed to help teens recognize and prevent digital dating abuse, the ads were run on its Wireless' Mobile Web service, Verizon FiOS internet and TV.[150][151]

Powerful Answers[edit]

In January 2013, Verizon launched the "Powerful Answers" campaign, designed by agency McGarryBowen.[152] The campaign centered around a contest in which $10 million in prizes was offered to individuals for finding solutions to "the world's biggest challenges" by making use of Verizon's cloud, broadband and wireless networks.[153][154] Winners of the inaugural competition were announced at the 2014 Consumer Electronics Show.[153] Israel-based TinyTap won the education category; Smart Vision Labs of Newport, Rhode Island, won in the healthcare category; and Mosaic Inc. of Oakland, California, won in the sustainability category.[153]

Inspire Her Mind[edit]

In June 2014, Verizon launched the "Inspire Her Mind" campaign, created by agency AKQA. It was designed to encourage girls' interest in science, technology, engineering and math,[155] and aimed to address findings from the National Science Foundation, whose research showed that 66 percent of fourth-grade girls said they were interested science and math, yet only 18 percent of college students in engineering and math are women.[156][157]

Flipside Stories (#NeverSettle)[edit]

In February 2015, Verizon launched its Flipside Stories ad campaign, featuring the #NeverSettle hashtag. The ads showed dramatized "testimonials" of people with and without Verizon Wireless or Verizon Fios services.[158][159][160]

Better Matters[edit]

In 2016, Verizon started using the slogan "Better Matters" in reference to its networks.[161]

Humanability campaign[edit]

Verizon launched its Humanability campaign in 2017.[162][163] The company aimed for the ads to showcase to consumers and investors its diversification of revenue sources and technology beyond smartphones. These include online advertising, data collection, Internet of Things, smart cities, telematics, and media.[162][163]

Corporate governance

Board of directors

The current board of directors is comprised as follows as of July 2019:[164]

- Hans Vestberg, chairman and CEO
- Shellye Archambeau
- Mark Bertolini
- Vittorio Colao
- Melanie Healey, former president of Procter & Gamble[165]
- Clarence Otis, Jr.
- Daniel H. Schulman
- Rodney E. Slater
- Kathryn Tesija, former executive vice president of Target Corporation
- Gregory Weaver, former CEO of Deloitte's audit and enterprise risk division

Executives

As of 2019:[166][167]

- Hans Vestberg, chairman and CEO
- Ronan Dunne, executive vice president and group CEO, Verizon Consumer
- Tami Erwin, executive vice president and group CEO, Verizon Business
- Guru Gowrappan, executive vice president and group CEO, Verizon Media

- Guru Gowrappan, executive vice president and group CEO, Verizon Media

Corporate responsibility

The Verizon Foundation is the philanthropic arm of Verizon Communications, which donates about $70 million per year to nonprofit organizations, with a focus on education, domestic violence prevention, and energy management.[168] Verizon's educational initiatives have focused on STEM fields,[169] including: a national competition for students to develop mobile application concepts;[169] the Verizon Innovative Learning Schools program, providing professional development for teachers in underserved areas;[170] and providing students with wireless hardware and services as part of President Obama's ConnectED program.[171] The company also runs HopeLine, which has provided mobile phones to approximately 180,000 victims of domestic violence,[172][173] and a program that offers grants for victims of domestic violence to start or grow home-based businesses.[174] As part of an initiative to reduce the company's carbon intensity metrics by 50 percent by 2020, Verizon announced planned investment in solar panels and natural gas fuel cells at its facilities.[175] The increased capacity would make Verizon the leading solar power producer among U.S. communications companies.[176]

On February 5, 2019, Verizon first entered the green bond market with an issue of $1 billion. The sale was oversubscribed, meaning that investors bids were about $8 billion. Verizon plans to invest money on renewable energy, for instance, by developing solar and wind energy energy-efficient projects involving technology and equipment replacement, and the deployment of 5G wireless technologies, allowing for real-time response for energy demand (smart building management and city systems), green buildings, sustainable water management, and also biodiversity and conservation.[177]

According to Cbonds, the newly issued green bonds have 3.875% coupon rate and will mature on August 5, 2029. Goldman Sachs and Bank of America Merrill Lynch were the bookrunners of the deal.[178]

Criticism

Security concerns

According to Google Project Zero researcher Tavis Ormandy, Verizon applies a simplistic certification methodology to give its "Excellence in Information Security Testing" award, e.g. to Comodo Group. It focuses on GUI functions instead of testing security relevant features. Not detected were Chromodo browser disabling of the same-origin policy, a VNC-delivered with a default of weak authentication, not enabling address space layout randomization (ASLR) when scanning, and using access control lists (ACLs) throughout its product.[179]

Net neutrality

Verizon and Comcast have been actively lobbying for current changes in the FCC's regulations that require internet service providers to offer all content at one internet speed regardless of the type of content since the early 2000s. In 2014, Verizon unsuccessfully sued the FCC for these powers.[180] Verizon has admitted to throttling content of its competitors including Netflix and YouTube.[181][182]

Deceptive advertising of 5G

In May 2020, the Better Business Bureau criticized Verizon for claiming it was "building the most powerful 5G experience for America" and recommended that the company make clear and conspicuous disclosures to consumers about the limited actual availability of its 5G network.[183] Verizon had been cited by the Better Business Bureau in March 2019 for ads that "convey the message that Verizon has achieved the important milestone of deploying the first mobile wireless 5G network" prior to 5G availability, falsely conveying that the technology was currently available.[184]

Privacy

Verizon has a one-star privacy rating from the Electronic Frontier Foundation.[185]

Sponsorships and venues

Verizon is the title sponsor of several large performance and sports venues as well as a sponsor of many major sporting organizations.

National Hockey League

In January 2007, Verizon secured exclusive marketing and promotional rights with the National Hockey League.[186] The deal was extended for another three years in 2012 and included new provisions for the league to provide exclusive content through Verizon's GameCenter app.[187]

Motorsports

In 2009 and 2010 Verizon sponsored Justin Allgaier in the NASCAR Nationwide Series, before they chose to opt out of a two-year-old NASCAR team sponsorship with Penske Racing in order to pursue an expanded presence with the IndyCar Series.[188] In March 2014 Verizon became title sponsor of the series through 2018.[189]

National Football League

In late 2010, Verizon Communications joined with Vodafone Group in a joint partnership to replace Sprint as the official wireless telecommunications partner of the National Football League.[190] The four-year deal was estimated at $720 million. In June 2013, Verizon announced a four-year extension with the NFL in a deal reportedly valued at $1 billion. The new agreement gave Verizon the right to stream every NFL regular-season and playoff game.[191]

[...]

Venues

Verizon is the title sponsor for a number of sporting and entertainment arena the Verizon Arena in North Little Rock, Arkansas;[196] and the Verizon Center in Mankato, Minnesota.[197] SNHU Arena in Manchester, New Hampshire, was originally known as the Verizon Wireless Arena until September 2016, when Southern New Hampshire University acquired the naming rights for a period of at least 10 years.[198]

Verizon has been the title sponsor of entertainment amphitheaters in locations throughout the United States, including four individually referred to as the "Verizon Wireless Amphitheatre": in Irvine, California;[199] Maryland Heights, Missouri;[200] Selma, Texas;[201] and Alpharetta, Georgia.[202]

Verizon is a former sponsor of the Capital One Arena in Washington, DC.[203]

The main home concert hall of the Philadelphia Orchestra at the Kimmel Center for the Performing Arts is named Verizon Hall.[204]

E6 THE BOSTON GLOBE • THURSDAY, APRIL 6, 2000

GTE Net division to hire 500 in state, change its name

By Ross Kerber
GLOBE STAFF

GTE Internetworking plans to hire 500 e-commerce consultants and engineers in Massachusetts this year to help develop its high-speed data network and offer services as part of a proposed spinout from GTE Corp.

The division, with headquarters in Burlington, also plans to announce today that it will change its name to Genuity Inc. as it becomes a publicly traded company.

The plan is part of a controversial bid by GTE and Bell Atlantic to gain government approvals for their $84 billion merger plan, which would create the country's biggest local phone company.

Currently, the GTE unit employs about 2,000 people in Massachusetts and 3,500 in all. It includes most of the assets of the former Bolt Beranek & Newman in Cambridge, which GTE bought in 1997 for $616 million. GTE says the unit had revenue of about $1 billion last year but wasn't profitable.

In 1969, Bolt Beranek was one of the Pentagon's first contractors for the computer system that became the Internet. More recently, the company has operated high-speed data connections for big corporations and Internet service providers. In February, it won a contract from America Online Inc., estimated to be worth more than $2.5 billion, to install new connections for the service provider.

If the Genuity spinout is approved, said GTE Internetworking's president, Paul R. Gudonis, the company would become one of the top four providers of Internet connectivity services, along with Sprint, WorldCom, and UUNet. To compete, Gudonis said, Genuity will offer more consulting services to help companies create corporate Internets and business-to-business services for e-commerce. Gudonis would be head of the new company.

The future of the division remains a touchy issue before regulators, however. In filings with the Federal Communications Commission, GTE and Bell Atlantic had proposed to spin off the unit as a public company and keep a 10 percent ownership interest, with an option to increase that to 80 percent within five years.

But competitor AT&T says that would leave those companies effectively in control of the unit. AT&T wants the FCC to insist that Bell Atlantic make more commitments to open local phone service to competition. The FCC is considering the arguments and hopes to rule on the merger by July.

Matthew Kovar, a manager at the Yankee Group consulting firm who follows the networking industry, said Genuity would be free as a stand-alone company to pursue a more aggressive strategy than it would be as a local phone company unit. "It's not a change to the entire business model," he said of Genuity's plans. "But maybe these are things they felt they weren't free to do, or weren't able to do, because of the lethargic Bell operating company mentality."

Gudonis said he couldn't discuss financial specifics, including the total amount of networking investment Genuity would make, until the company files registration statements with the Securities and Exchange Commission to sell public shares. No filings are expected until the FCC clears the merger of the parent companies, he said.

Gudonis's tenure with the GTE unit dates back to 1994, when he joined Bolt Beranak as president of what then was known as its "BBN Planet" division, providing high-speed data services to individual companies. The business totalled about $5 million that year, he said; now it will generate the majority of Genuity's revenue. In addition to Internet companies, customers include Honeywell and FleetBoston Financial Corp.

Genuity also will invest heavily to upgrade its Internet backbone services so it can eventually handle the heavy demands needed to send video signals to homes via cable modems and high-speed phone lines. Clients for these services include Yahoo Inc. and General Electric's NBC Interactive, he said.

The unit is also constructing a new office park in Woburn. Gudonis said it will house 1,400 people by next year, some of whom transferred from other offices in the state.

TECHNOLOGY & INNOVATION

Genuity's plan to raise $2.6b in IPO would be largest by ISP

BLOOMBERG NEWS

WASHINGTON – Genuity Inc., the pioneering Internet unit of GTE Corp., said its planned initial public offering could raise as much as $2.6 billion, making it the largest ever for a US Internet service provider.

GTE, a local phone service provider based in Irving, Texas, is selling 90.5 percent of Genuity, whose Internet roots date back to the sending of the first e-mail.

GTE is making the sale so regulators will allow it to be bought by Bell Atlantic Corp. and form the biggest US local phone company under the name Verizon Communications. Bell Atlantic said yesterday it expects to complete the purchase next month.

Burlington, Mass.-based Genuity first filed for the IPO last month without specifying the number of shares being sold or the price being sought.

"It's obviously a very large deal, and it's unclear in this type of environment how willing the market will be to swallow something of this size," said Darren Chervitz, a money manager at Jacob Asset Management in New York.

Genuity said it plans to sell 173.9 million Class A common shares for between $12 and $15 each, raising between $2.1 billion and $2.6 billion before expenses. At the $13.50 midpoint of the expected price range, the stock sale would be worth $2.3 billion, according to Genuity's amended IPO filing to the Securities and Exchange Commission.

At the top of the expected price range, Genuity would rank as the ninth-biggest IPO in US history and the largest ever for a US Internet service provider. Among worldwide Internet IPOs, Genuity would likely rank behind Germany's T-Online International AG, which raised $2.8 billion last month, Chervitz said.

The value of Internet stocks and IPOs have fallen in recent months. Since March 10, the Bloomberg US Internet index has dropped by more than half, from 301.78 to 137.64, while the Bloomberg IPO Index has sunk from 2415.11 to 1007.47.

Genuity said it plans to use $1.8 billion of the funds being raised to expand its network, which makes up part of the mesh of wires that connect computers around the world and are referred to as the backbone of the Internet. The rest of the IPO proceeds would be available for other general purposes, which could include acquisitions, although none are in the works now, the filing said.

The IPO funds would represent only a part of the company's capital spending plan to expand its network infrastructure at the cost of $11 billion to $13 billion between 1999 and 2004. Genuity plans to spend $1.8 billion to $2 billion on the project this year, according to the filing.

The entire company, with 192.2 million shares to be outstanding immediately after the IPO, would have a market value of between $2.3 billion and $2.9 billion at the IPO price range. At the midpoint, Genuity would be valued at $2.6 billion.

The combined GTE and Bell Atlantic hold about 18.3 million Class B common shares, giving them 9.5 percent in Genuity following the IPO. Those shares would be worth between $219.1 million and $273.8 million, at the $12-15 per share price range. At the $13.50 midpoint, the stake would be worth about $246.5 million.

Under their proposal to regulators, the companies could convert their Class B shares – which are largely identical to the publicly traded Class A – into 800 million Class C common shares, which get five votes each versus one apiece for the other classes. The conversion would give Bell Atlantic and GTE an 82 percent equity stake and 96 percent voting control over Genuity, the filing said.

The companies could make the swap if they permit competition from other companies within Bell Atlantic's local phone markets in 12 states, by an unspecified date in 2005. Bell Atlantic's 13th state, New York, already is open. US law forbids a local carrier from providing long-distance service – including Internet access – in states where it hasn't completed steps to allow local competition, according to the filing.

Bell Atlantic plans an IPO this year for another of its businesses, Verizon Wireless, which is a joint venture with Vodafone AirTouch PLC.

GTE shares rose 37.5 cents to close at $60.625, after reaching as high as $61.50 in late afternoon trading.

[HN01F6][GDrive]

2000 (June 19) - RCRWireless article - Verizon gets green light ; The FTC approves transfer of GTE Corp.'s communications licenses to Bell Atlantic Corp

See [HW005C][GDrive] - By Reily Gregson on JUNE 19, 2000Archived Articles

WASHINGTON-The Federal Communications Commission late Friday approved the transfer of GTE Corp.'s communications licenses to Bell Atlantic Corp. contingent on 25 conditions, including putting some wireless properties into a trust until they can be sold so as to not violate cellular cross-ownership rules.

"There will be those that will claim this merger brings us closer to a re-emergence of Ma Bell, however, my support is predicated on the applicants' enforceable commitments to open its traditional local markets to competitors, invest in new markets and accelerate deployment of broadband technologies. The end result should produce more competition, not less," said FCC Chairman William Kennard.

"This is a great day for Bell Atlantic and GTE, for our customers, our investors and our employees … This final approval contains reasonable conditions that clear the way to unite these two great companies into Verizon Communications," said Charles R. Lee, chairman and chief executive officer of GTE and designated chairman and co-CEO of the new company. The merger is expected to close by June 30.

Bringing GTE's wireless holdings into Verizon Wireless-the mobile-phone company consisting of Bell Atlantic Mobile, PrimeCo and Vodafone AirTouch plc-would create the nation's largest wireless company, with more than 24 million customers and a footprint covering 90 percent of the United States.

"Our ability to deliver a full plate of voice, data, Internet and wireless services to all our customers will make Verizon the next great brand in communications," said Ivan Seidenberg, chairman and CEO of Bell Atlantic and designated president and co-CEO of Verizon.

Bell Atlantic and GTE obtained Department of Justice approval after selling off overlapping wireless properties. Some of the sales were made in a multiproperty deal with Alltel Corp., which was approved by the FCC's Wireless Telecommunications Bureau last week.

One of the major conditions on the transfer involves GTE's Internet backbone, operation of which would violate the Telecommunications Act of 199

To get around the telecom act's prohibition against regional Bell operating companies offering long-distance services, Bell Atlantic and GTE proposed, and the FCC accepted, spinning off the Internet backbone into a new entity called Genuity [(Genuity Incorporated (2000))].

Verizon would have a 9.5 percent interest in **Genuity [(Genuity Incorporated (2000))]** until Verizon is granted long-distance authority in the former Bell Atlantic states. Bell Atlantic has received such authority in New York but still has 12 states and the District of Columbia to go. Once approval has been obtained, Verizon would then be permitted to control up to 80 percent of Genuity. If approval is not granted for at least 50 percent of the old Bell Atlantic territory within five years, the conversion to 80-percent stock would evaporate.

Seidenberg said he expects long-distance approval within two years from the close of the merger.

This arrangement satisfied FCC Commissioner Susan Ness, who said approving the merger was "a close call."

Both Republican members of the commission partially dissented in the approval because of the conditions placed on it.

"None of the shortcomings I address here or in my previous statement on these issues will ever be addressed unless the commission begins to reform the majority's `balancing approach' to merger review that we apply again here, or seriously question the aforementioned specious theories of potential harm," said FCC Commissioner Michael Powell.

FCC Commissioner Harold Furchtgott-Roth also dissented because he does not believe the commission should be involved in regulating undersea cable licenses. This is one of the approvals the FCC granted.

Amid concerns that someone might challenge the license transfers, the companies said they believe the approval with conditions can withstand any court challenge.

"We think this arrangement is bullet proof. We believe we have the best lawyers and best consultants that one could have … We don't think there is a minuscule chance that this would be overturned," said Lee.

Fate of WorldCom/Sprint

Internet issues also may derail WorldCom Inc.'s hopes of marrying Sprint Corp. and gaining control of Sprint PCS.

Sprint Chairman William Esrey told shareholders last week at the company's annual meeting in Westwood, Kan., that some Justice Department staff do not support the merger.

"We have had a number of high-level meetings with [DOJ] officials in recent weeks, but it remains unclear if we will or will not get the necessary government clearances to implement the merger," Esrey said.

WorldCom needs the merger to fill in the large wireless gap in its offerings. Sprint needs to expand its international reach. Both companies would benefit from combining their fixed-wireless assets.

While DOJ seems concerned with the antitrust implications of a merger between the nation's No. 2 and No. 3 long-distance companies, the European Commission is concerned about WorldCom's dominance of the Internet. Experts believe WorldCom is willing to sell off Sprint's Internet backbone but not its stake in UUNet.

Similar concerns when WorldCom bought MCI Communications Corp. led to the sale of some of WorldCom's assets to Cable and Wireless plc. This sale was not successful and experts believe the EC does not want to create a repeat situation.

The EC is scheduled to make a decision by July 12

Should WorldCom/Sprint convince DOJ and EC officials that the merger would create an all-distance company in an all-distance telecommunications market, the company still must receive FCC approval to transfer its licenses.

2002 (July 26) - NYTimes - "Genuity Faces Bankruptcy As Verizon Ignores an Option"

By Seth Schiesel With Simon Romero ; See [HN01C4][GDrive] ;

This article is also located at [**Genuity Incorporated (2000)**]

Genuity [(Genuity Incorporated (2000))], the last of the original Big Three Internet carriers, may be about to go the way of its competitors -- into bankruptcy.

Verizon, the No. 1 local phone company, said yesterday that it would not rescue Genuity from the telecommunications and technology vortex by taking control of the company.

Verizon, which spun off **Genuity [(Genuity Incorporated (2000))]** two years ago, had been expected to reassume control of the company by June 2005, under terms of the spinoff

Yesterday's announcement sent Genuity's stock plummeting by 89 percent to close at 29 cents, pushed Genuity into default on $3 billion in loans and raised the possibility that the company might have to file for bankruptcy protection within months. If that happens, Genuity would take its place alongside WorldCom's UUNet division and PSINet as former highflying Internet "backbone" companies operating under bankruptcy protection.

A sharp sell-off of Genuity's shares on Wednesday -- otherwise the best day for stocks in 15 years -- suggested that some traders might have had advance warning of yesterday's announcement. Certainly, the Wall Street grapevine may have known something was afoot: **Genuity [(Genuity Incorporated (2000))]** revealed yesterday that on Monday, it had drawn down $723 million from a prior credit line with eight banks.

But Genuity said yesterday that it had no idea that Verizon was planning to drop its option when Genuity called on the banks Monday. "This is absolutely coincidental from our standpoint," Susan Kraus, a Genuity spokeswoman, said yesterday. "We had absolutely no knowledge of what Verizon was going to do."

As the Internet came to popular attention in the early 1990's, three companies emerged as the leading carriers of Internet data: Uunet, PSINet and Genuity's predecessor, BBN. As telephone companies expanded into data networking in the 1990's, they were eager to acquire those early pioneers. Although PSINet remained independent, [**UUNET Technologies, Incorporated**] was acquired by [**MFS Communications Company, Incorporated**] shortly before MFS was acquired by **WorldCom** [, which later became **MCI WorldCom Corporation**,] in 1996. GTE acquired BBN in 1997 and later renamed it Genuity.

When Bell Atlantic acquired GTE in 2000, creating Verizon, the combined company spun off 90 percent of Genuity as a condition for winning regulatory approval for that deal. Bell Atlantic was not allowed to control Genuity because Bell Atlantic was not then allowed to sell long-distance communications services, including data networking.

But Verizon accurately anticipated that it would win the necessary long-distance approval within a few years. So, when it spun off most of Genuity to public shareholders in 2000, it retained the ability to reassume control of Genuity by mid-2005.

Until recently, many investors expected that Verizon would assert its option, given that Genuity had grown from $183 million in revenue in 1997 to $1.2 billion last year.

Genuity's losses, however, have also grown. Were Verizon to reacquire control of Genuity, it would also have to consolidate Genuity's $3 billion in debt and its annual losses -- $4 billion last year -- into its own financial statements.

Already jittery about the state of the regional Bell companies, investors were loath for Verizon to make that move. As a result, Verizon said yesterday that it would not. Now, Verizon appears to believe that it can get into the long-distance data communications business without assuming Genuity's baggage

Given the stock movement on Wednesday, the most important outstanding questions are about just when Verizon made that decision and when Verizon told Genuity.

On Wednesday, as the Dow Jones industrial average soared by nearly 489 points, Genuity's shares plunged by 26 percent, to $2.59, from Tuesday's close of $3.50. Peter Thonis, a Verizon spokesman, said yesterday that Verizon did not tell Genuity about its decision until after the stock market closed on Wednesday.

As for **Genuity [(Genuity Incorporated (2000))]**, the question is why it rushed to borrow $723 million on Monday.

Genuity said yesterday that the group of eight banks really should have been nine and that the $723 million really should have been $850 million. Genuity said Deutsche Bank refused to honor a commitment to lend it an additional $127 million, and that it had sued Deutsche Bank in Federal Court in Massachusetts.

Deutsche Bank said that it had not received any legal papers and that it was in talks with Genuity.

People close to Genuity's lenders said yesterday that Genuity called its banks on Monday morning and demanded the money remaining under its prior credit line by noon that day. Some banking executives said yesterday that companies generally were prepared to wait 48 hours before actually receiving cash under a credit line. They speculated that Deutsche Bank could have been unnerved by the unusually urgent nature of Genuity's request.

Ms. Kraus, the Genuity spokeswoman, said Genuity's agreement with its lenders allowed the company to draw on its loans quickly.

Some bankers speculated yesterday that the eight other banks that did comply might have inferred that Genuity was worried about Verizon's intentions. Moreover, according to people close to both Genuity and Verizon, Michael T. Masin, a Verizon vice chairman and Genuity board member, was asked not to attend a Genuity board meeting on Sunday. His exclusion could have fueled a perception that Genuity suspected that Verizon would cut it loose soon.

2002 (Jul 26) - Forbes - "Genuity Is Left On The Launching Pad"

See [HP004D][GDrive]

This article is also located at [**Genuity Incorporated (2000)**]

Genuity [(Genuity Incorporated (2000))] introduced itself to a puzzled public two years ago with an ad campaign that featured a mysterious-looking black rocket and a very 1990s tagline: "Do you want to change the world?" But the '90s, alas, had just ended, and the world had already changed--and not for the better, if you were a tech investor.

Now Genuity and its rocket appear headed for the auction block. Irony abounds in the situation, for Genuity descends from BBN, the firm that pretty much built the original Internet. The firm's current travails offer yet another sad illustration of the Moses syndrome, in which the visionary genius who points the way to the promised land fails to make it there himself.

Genuity [(Genuity Incorporated (2000))] operates a major Internet backbone network. The firm started touting its Black Rocket network services platform with that ad campaign in late 2000, just as the Internet stock market boom was collapsing. Genuity remained unprofitable, and investors abandoned this stock en masse on July 25, after Verizon Communications cut the lifeline that theoretically had tethered Genuity to its former corporate parent.

[**Verizon Communications Incorporated**] on July 24 [2002] effectively relinquished its right to reacquire a controlling interest in **Genuity [(Genuity Incorporated (2000))]**. That decision pushed Genuity into default on some of its credit agreements. The next day its shares fell almost 90%, to 29 cents from $2.59, and although it was back up over 50 cents today in afternoon trading, the stock has been cut to a rare "sell" rating by at least one Wall Street analyst. Genuity Chairman Paul Gudonis was reduced to talking up his "valuable set of assets," which is the verbal equivalent of hanging a "for sale cheap" sign on the front door.

"Now that Verizon has elected not to reintegrate Genuity, we will evaluate all our options, which could include seeking another strategic partner or restructuring our operating plan while we address this situation," Gudonis said in a statement expressing disappointment with Verizon's decision.

BBN--originally Bolt, Beranek and Newman--was founded in Cambridge, Mass., in 1948 by professors from the Massachusetts Institute of Technology. Then in 1960, BBN employee J.C.R.LicklideJ.C.R. Licklider famously forecast the Internet with his seminal "Man-Computer Symbiosis" paper. It was BBN that built the ARPANET, the Internet's forerunner; it was BBN's RayTomlinsonRay Tomlinson who invented e-mail, which soon composed the bulk of the Internet's traffic. So it made sense that BBN would end up a major Internet backbone firm. In 1997 it was acquired by GTE in a deal valued at $616 millio

A few months later, GTE bought a Bechtel Enterprises unit called Genuity [(Genuity Incorporated (2000))] and combined it with BBN. Then in 2000, GTE merged with Bell Atlantic to form Verizon. The Internet network had to be spun off, because a Baby Bell was not allowed to be in the long-distance data business. But Verizon retained an option, if certain conditions were met, to reabsorb Genuity. The general expectation was that Verizon one day would exercise that option, which is why this week's announcement to the contrary left the spinoff gasping for life.

With WorldCom already in Chapter 11 proceedings, its UUNet Internet backbone unit presumably is being shopped around. Now Genuity too is up for grabs--and with it, the storied BBN legacy. It's one thing to invent the Internet, it seems, and quite another to figure out how to make it pay.

2002 (Nov 27) - NetworkWorld - Level 3 to buy bankrupt Genuity's assets

Stephen LawsonBy Stephen Lawson ; See [HP004I][GDrive]

This article is also located at [**Genuity Incorporated (2000)**]

Internet backbone provider [**Level 3 Communications, Incorporated**] has agreed to acquire the bulk of the assets of network provider **Genuity [(Genuity Incorporated (2000))]**, which has filed for bankruptcy, the companies announced Wednesday.

Level 3 will pay as much as $242 million in cash and assume a significant portion of Genuity's long-term operating agreements, according to a statement from the companies. The deal must be approved by regulatory agencies and a bankruptcy court and is expected to close in the first quarter of 2003.

Also Wednesday, **Genuity [(Genuity Incorporated (2000))]** filed voluntary petitions for reorganization under Chapter 11 of the U.S. bankruptcy code, the statement said. The cash on Genuity's balance sheet, together with Level 3's cash payment, will be distributed to creditors of Genuity.

Based in Woburn, Mass., **Genuity [(Genuity Incorporated (2000))]** was spun out of U.S. telecommunications carrier [**Verizon Communications Incorporated**] according to the terms of the merger of Bell Atlantic and [**GTE Corporation**] that created Verizon in 2000. More recently, the company has been suffering financially amid a glut of capacity on backbone networks. In May, Genuity announced that it would cut as much as 30 percent of its workforce, or 1,200 jobs.

[**Level 3 Communications, Incorporated**], in Broomfield, Colorado, will acquire Genuity's network transport business as well as its dedicated and dial-up Internet access operations. It also will take over Genuity's managed services business, which it will combine with its iStructure subsidiary but continue to operate under the Genuity brand.

Genuity's biggest customers are Verizon and AOL, according to the statement. Verizon has executed a new multi-year contract to buy wholesale dial-up, transport and other services from Level 3, which should take effect when the acquisition closes.

2002 (Nov 27) - "Level 3 to acquire Genuity assets and operations for $242 million"

Source - LightWaveOnline - [HW005H][GDrive]

This article is also located at [**Genuity Incorporated (2000)**]

[**Level 3 Communications, Incorporated**] and **Genuity Inc. [(Genuity Incorporated (2000))]** announced today that they have signed a definitive agreement under which Level 3 will acquire substantially all of the assets of the Massachusetts-based communications company.

[**Level 3 Communications, Incorporated**] will pay up to $242 million in cash and assume a significant portion of existing long-term operating agreements to acquire Genuity's assets and operations. To facilitate the transaction, **Genuity [(Genuity Incorporated (2000))]** today is filing voluntary petitions for reorganization under Chapter 11 of the Bankruptcy Code. Level 3's cash consideration at closing could be reduced subject to certain material adjustments.

Closing is expected to occur during the first quarter of 2003. The transaction is subject to approval by the bankruptcy court and certain government regulatory agencies.

"This transaction represents the best outcome for the key constituencies of both Genuity and Level 3," contends Paul R. Gudonis, chairman and chief executive officer of Genuity. "Both companies, as well as Genuity's largest customers and creditors, have signed agreements supporting the transaction."

"There is a unique and compelling fit between Genuity and Level 3," adds James Q. Crowe, Level 3's chief executive officer. "The transaction combines the assets and operations of Genuity, the company that helped invent the Internet, with Level 3, the company that built the first network fully optimized for Internet Protocol-based communications. Both companies are experienced providers of optical and IP-based services, and both are Tier 1 Internet backbone providers with industry-leading quality of service. Genuity's transport and dedicated and dial-up Internet access business--more than 80 percent of revenue--is complementary to Level 3's transport, managed modem and IP services business."

Based in Woburn, MA, **Genuity [(Genuity Incorporated (2000))]** operates an international IP network. The company provides dial-up and dedicated Internet access, transport, managed security and VPN, hosting and other services to communications companies, enterprises and government agencies. Its largest customers are Verizon Communications and America Online, which accounted for greater than 60 percent of its $223 million in revenue for the third quarter of 2002.

All but one of Genuity's banks have signed an agreement in support of the transaction. Verizon has executed a new multi-year contract to purchase wholesale dial-up, IP, transport and other services from Level 3, to take effect when the transaction closes. America Online has signed an agreement consenting to the transaction that contemplates [**Level 3 Communications, Incorporated**] acquiring America Online's network services agreement with Genuity. In addition, Allegiance Telecom Inc., Genuity's largest network supplier, supports the transaction.

As part of this transaction, Level 3 is also acquiring Genuity's managed services business and its associated enterprise customers and product set. "We recognize the importance of these customers and are committed to ensuring they receive the highest quality service without disruption," asserts Kevin O'Hara, president and chief operating officer of Level 3. "As a result, we plan to combine these operations with those of our (i)Structure subsidiary in order to focus on the needs of those customers. That new managed services operating company will do business under the name 'Genuity,' a recognized leader in that market." [...]

2003 (Aug 19) - CenturyLink corporate news - Level 3 to Sell Midwest Fiber Optic Network Acquired in Genuity Transaction

See [HC004L][GDrive]

This article is also located at [**Genuity Incorporated (2000)**]

BROOMFIELD, Colo., Aug. 19 /PRNewswire-FirstCall/ -- [**Level 3 Communications, Incorporated**] announced today that it has signed a definitive agreement to sell the **Midwest Fiber Optic Network (MFON)**, a regional communications system it acquired through its recent transaction with **Genuity** [**(Genuity Incorporated (2000))**].

CenturyTel (NYSE: CTL) will purchase the stand-alone system, which serves as a regional backbone for a number of carriers, including CenturyTel itself, in Arkansas, Missouri and Illinois. The purchase price is approximately $17 million in cash, subject to adjustments including date of closure and system revenue at time of close. Closing is subject to regulatory approvals and customary conditions.

"This is a non-core asset for Level 3," said Sunit Patel, Level 3's chief financial officer. "While MFON currently generates approximately $1.5 million a month in revenue, the geography and architecture of the system do not offer us a practical or cost-effective way to integrate its operations into the Level 3 network. As such, we believe it makes sense to sell this business and continue to focus on the integration of the core assets, customers and traffic from the Genuity transaction."

Closing is expected to occur by the end of the fourth quarter of 2003.

Daniels & Associates, the Denver-based media and telecommunications mergers and acquisitions specialist, served as financial advisor to Level 3 on this transaction.

- **About Level 3 Communications :** Level 3 (Nasdaq: LVLT) is an international communications and information services company. The company operates one of the largest Internet backbones in the world, is one of the largest providers of wholesale dial-up service to ISPs in North America and is the primary provider of Internet connectivity for millions of broadband subscribers, through its cable and DSL partners. The company offers a wide range of communications services over its 22,500-mile broadband fiber optic network including Internet Protocol (IP) services, broadband transport, colocation services, and patented Softswitch-based managed modem and voice services. Its Web address is www.Level3.com. The company offers information services through its subsidiaries, (i)Structure and Software Spectrum. For additional information, visit their respective web sites at www.softwarespectrum.com, and www.i-structure.com.
- **About CenturyTel :** CenturyTel, Inc. provides communications services including local, long distance, Internet access and data services to more than 3 million customers in 22 states. The company, headquartered in Monroe, Louisiana, is publicly traded on the New York Stock Exchange under the symbol CTL, and is included in the S&P 500 Index. CenturyTel is the 8th largest local exchange telephone company, based on access lines, in the United States. Visit CenturyTel at www.centurytel.com.

2004 (Feb 05) - Network World : "Verizon selling off net innovator BBN"

See [HP004H][GDrive]

Verizon Friday announced it has sold off BBN Technologies to the subsidiary's management team in conjunction with venture capital firm Accel Partners and private equity outfit General Catalyst. Terms of the deal weren't disclosed.

BBN, which was founded in 1948, came to Verizon by way of the merger of former BBN parent company GTE with Bell Atlantic in 2000. The GTE-Bell Atlantic combination became Verizon

R&D specialist BBN has cemented its place in network industry lore through its operation of ARPANET, a precursor of the Internet, and the first implementation of packet switching in 1969. More recently, the company has made advances on the security front in the area of quantum cryptography.

Never a huge self-promoter, the organization has been particularly quiet since becoming a Verizon unit. BBN lists just three 2003 press releases on its Web site, for instance.

The company will continue to be led by Tad Elmer, who has been president since 1999 and a member of the organization for more than 25 years.

Accel Managing Partner Jim Breyer said in a statement that the venture firm bought into BBN mainly to get access to its team. "These are simply people we wanted to be in business with," he said, noting how the company's penchant for technology innovations is in line with the kinds of start-ups Accel looks to fund.

Verizon said it is dealing BBN as part of its ongoing review of assets.

2005 (May 12) - BusinessWire - BBN Technologies Appoints George Conrades, Executive Chairman of Akamai Technologies, to Board of Directors

Source - [HW005I][GDrive]

CAMBRIDGE, Mass.--(BUSINESS WIRE)--May 12, 2005--BBN Technologies, a leading provider of advanced technology and research and development, announced today that [George Henry Conrades (born 1939)], executive chairman of [Akamai Technologies, Incorporated], has been appointed to BBN's Board of Directors. Mr. Conrades served as the CEO of [BBN Technologies, Incorporated] from 1994 to 1997.

"I'm delighted to join the Board of Directors of BBN Technologies, a highly respected organization renowned for developing innovative solutions to some of the world's most challenging problems," said Mr. Conrades. "It's a privilege to be reunited with BBN's world-class scientists and their excellent work."

“George brings to the BBN board an outstanding record of technology and business leadership together with a deep understanding of and appreciation for BBN's business, culture, and core values”

The BBN Board of Directors also includes: Tad Elmer, BBN's president and CEO; David Fialkow and Ken Novack, managing director and advisory board member of General Catalyst Partners, respectively; Jim Breyer and Kevin Efrusy of Accel Partners; and Anita K. Jones, the Lawrence R. Quarles Professor of Engineering & Applied Science, and Professor of Computer Science in the School of Engineering and Applied Science at the University of Virginia.

"George brings to the BBN board an outstanding record of technology and business leadership together with a deep understanding of and appreciation for BBN's business, culture, and core values," said Mr. Elmer. "His counsel will help us grow and prosper."

[George Henry Conrades (born 1939)] was named Chairman and Chief Executive Officer of Akamai in April 1999, bringing a broad range of business experience in the computing, Internet, telecommunications, and media industries. Mr. Conrades became Executive Chairman of Akamai in April 2005.

Before joining Akamai, Mr. Conrades was Executive Vice President and President of GTE Internetworking following the firm's acquisition of BBN Corporation in 1997. At [GTE Corporation], he was responsible for creating GTE Internetworking and leading GTE's rapid growth in the data and Internet business, including integrated telecommunications services.

From 1994 until GTE's acquisition of BBN, [George Henry Conrades (born 1939)] served as CEO of BBN, where he built BBN Planet into one of the industry's top-tier ISPs. BBN designed, built, and deployed the first four nodes of the ARPANET, the forerunner to today's Internet.

Mr. Conrades currently serves as a venture partner at Polaris Venture Partners, an early stage investment company.

Vickers Building, Baltimore

[HW000K][GDrive]

Source - [HW000J][GDrive]

The Vickers Building represents a shift in downtown Baltimore architectural design that occurred directly after the Great Baltimore Fire of 1904 and is one of the largest buildings to utilize brick as a primary material in the Central Business District. Most of the other buildings rebuilt in the area were made of stone. Masonry was popular after the Great Fire because of fireproofing concerns.

Before the Great Fire, many buildings (including the old Vickers Building the new one replaced) were built in the ornate Second Empire style and featured sloping Mansard roofs and complex architectural details. This changed after the Great Fire. Architects took a more pragmatic approach to rebuilding the Central Business district and were pressured to create buildings that were cost- efficient, fire safe, and could be erected quickly. Because of all the national attention after the Fire, the city wanted to show the rest of the country its stability and they wanted to do it quickly.

The permit for the Vickers Building was issued on May 19, 1904, only three months after the fire. Many of the building's properties indicate fire-conscious planning: it's made of brick; it has a flat roof because people believed spacious Mansard roof attics contributed to the spread of the Fire; and the bay windows recede into the building rather than protrude outwards.

Not all ornamentation was eschewed from the construction of the Vickers Building. Stone lion heads adorn the topmost bay windows and a band of terra cotta runs along the street facing side of the roof. The interior is home to Werner's Restaurant: a mainstay in the area since 1951.

Blog from CharmCityHistory Blogspot - "Mr. Vickers' Building and His Inventive Tenants"

Source - [HW000L][GDrive]

Much has been said about the Vickers Building (219-231 East Redwood Street, once German Street) mainly associated with 2001 preservationist efforts by the Historic American Buildings Survey (HABS) and the Maryland Historical Trust, in coordination with the City of Baltimore's Commission for Historical and Architectural Preservation (CHAP) and Preservation Maryland. Baltimore Heritage highlighted that the permit for this 'new' Vickers Building (to replace the old Vickers Building with ornate Second Empire style with Mansard roofs and complex architecture details) was issued on May 19, 1904, merely 3 months after the Great Baltimore Fire of 1904.

Architects like Meyers and Eitelman after the fire took practical approaches to design that focused on cost-efficiency and quick rebuilding practices that focused on fire-conscious planning. Brick facing, flat roofs, and receding bay windows were employed vs. Mansard roofs, and protruding bay windows which were designs believed to have contributed to the Fire's spread.

Mr. George R. Vickers, Jr. (1843-1916), whose surname is predominantly etched in multiple places upon the building, was the son of a prominent businessmen of Baltimore by the same name who helped found one of the oldest banks in the city, National Marine Bank of Baltimore (currently at 33 South Gay Street), incorporated in 1810. Like his father, George Jr. was Vice-President of the bank and he was also determined to erect the four-story brick office building replacing his father's previous office building. It was built costing $50,000 and Mr. Vickers Jr. first advertised office space as being desirable to stock brokers and bankers in the Baltimore Sun in November 1904.

*While it is well know that a current occupant of the building (since 1950) is **Werner's Restaurant**, with its remarkably intact example of art deco interior complete with late Moderne lunch counter, there have been a few interesting and odd inventors with historical connections who have occupied its walls. Five years after opening, a New Jersey-based business by the name of The Collins Wireless Telephone Company established an office in the Vickers Building in September 1909 - it was to demonstrate to Baltimore a novel system that was essentially one of the earliest predecessors of today's modern cellular telephone.*

*Archie Frederick Collins, resident of New York City, filed Patent Number 814,942, dated March 13, 1906, entitled **Wireless Telephony** by stating "my invention relates to the art of transmitting and receiving articulate speech electronically between two or more stations without connecting wires." Indeed, a Baltimore Sun article reported the demonstration resulted in conversation that "could be distinctly heard at both telephones, one being located on a scow off the United Fruit Company's pier, on Pratt Street, and the other on the pier of the Standard Oil Company, a distance of about 500 feet.... Voices at both ends could be distinctly understood and distinguished, being transmitted in a clear, liquid tone, coming as plainly as over the ordinary telephone."*

*An article, published by Collins' assistant in Modern Electronics, August 1908, gave a somewhat odd foreshadowing of today's modern cell phone: **The Collins Wireless Telephone** will make "it possible to telephone from automobiles to the garage where help is needed... every auto will be provided with a portable wireless telephone. Then in the event of the inevitable accident the phone can be taken out, set up ready for use and communication can be established."*

You can read about Mr. Collin ... Genius or Fraud? but, suffice it to say, in 1911 four officers of the company were indicted for using the mails to defraud in selling worthless stock and he was charged and convicted of giving fraudulent demonstrations of his wireless telephone on October 14, 1909 at the Electrical Show in Madison Square Garden, NY for the purpose of selling stock in the Company.

*The Vickers Building hosted another inventor, Thomas Marshall Smith (great-grandson to Chief Justice John J. Marshall), merely a month later in October 1909, demonstrated his Baltimore invention in room 209 - it was known as **The St. Margaret's Invalid Lifter**. The British Journal of Nursing featured it in 1910 as being "the nurse's friend." It was only advertised in local papers for one month having the recommendations of doctors from Johns Hopkins University and the U.S. Government eventually attaining Patent Number 976,307, dated November 22, 1910, entitled **Hydraulic Invalid Lifter**.*

By May 28, 1911, while there were numerous lifts for invalids being used, his was hailed by the Baltimore Sun as being "A Boon To The Sick" since the heavy lifting was done hydraulically through a pump with the simple press of a foot on a pedal at the base near the floor. According to a feature article, Mr. Smith came to his idea through a desire to help his mother, who late in life lost the use of her limbs and was large and heavy.

George Vickers Jr continued as a well respected businessman, predominantly as Vice President of the bank for 30 years, but was at one time involved in a Court of Appeals of Maryland suit from a judgement he received over a contract land tract 1903 purchase dispute in which he lost in Baltimore Circuit Court against the Mayor and City Council of Baltimore. Oddly enough, during the State Court appeal, Edgar Allen Poe and Albert C. Ritchie argued against Mr. Vickers on behalf of the City. He lived at 1317 North Eutaw Street until his death but his memory lives on as do the novel ideas of the tenants in his building.

Specialty

virology

[edit on Wikidata]

Virotherapy is a treatment using biotechnology to convert viruses into therapeutic agents by reprogramming viruses to treat diseases. There are three main branches of virotherapy: anti-cancer oncolytic viruses, viral vectors for gene therapy and viral immunotherapy. These branches utilize three different types of treatment methods: gene overexpression, gene knockout, and suicide gene delivery. Gene overexpression adds genetic sequences that compensate for low to zero levels of needed gene expression. Gene knockout utilizes RNA methods to silence or reduce expression of disease-causing genes. Suicide gene delivery introduces genetic sequences that induce an apoptotic response in cells, usually to kill cancerous growths.[1] In a slightly different context, virotherapy can also refer more broadly to the use of viruses to treat certain medical conditions by killing pathogens.

History[edit]

Chester M. Southam, a researcher at Memorial Sloan Kettering Cancer Center, pioneered the study of viruses as potential agents to treat cancer. [Source : [HN01JE][GDrive]]

Oncolytic virotherapy[edit]

1) Oncolytic virus unable to enter cells without specific receptor. 2) Oncolytic virus is able to enter tumor cells with specific receptors where they replicate and lyse the cell as well as recruit other immune cells.

Main article: Oncolytic virus

Oncolytic virotherapy is not a new idea – as early as the mid 1950s doctors were noticing that cancer patients who suffered a non-related viral infection, or who had been vaccinated recently, showed signs of improvement;[3] this has been largely attributed to the production of interferon and tumour necrosis factors in response to viral infection, but oncolytic viruses are being designed that selectively target and lyse only cancerous cells.

In the 1940s and 1950s, studies were conducted in animal models to evaluate the use of viruses in the treatment of tumours.[4] In the 1940s–1950s some of the earliest human clinical trials with oncolytic viruses were started.[5][6]

Mechanism[edit]

It is believe that oncolytic virus achieve their goals by two mechanism: selective killing of tumor cells as well as recruitment of host immune system.[7][8] One of the major challenges in cancer treatment is finding treatments that target tumor cells while ignoring non-cancerous host cells. Viruses are chosen because they can target specific receptors expressed by cancer cells that allow for virus entry. One example of this is the targeting of CD46 on multiple myeloma cells by measles virus. [9] The expression of these receptors are often increased in tumor cells.[8] Viruses can also be engineered to target specific receptors on tumor cells as well.[8] Once viruses have entered the tumor cell, the rapid growth and division of tumor cells as well as decreased ability of tumor cells to fight off viruses make them advantageous for viral replication compared to non-tumorous cells.[7][8] The replication of viruses in tumor cells causes tumor cells to lyse killing them and also release signal to activate the host's own immune system, overcoming immunosuppression. This is done through the disruption of the microenvironment of the tumor cells that prevents recognition by host immune cells.[8] Tumor antigens and danger-associated molecular patterns are also released during the lysis process which helps recruit host immune cells.[8] Currently, there are many viruses being used and tested, all differing in their ability to lyse cells, activate the immune system, and transfer genes.

Clinical Development[edit]

As of 2019, there are over 100 clinical trials looking at different viruses, cancers, doses, routes and administrations. Most of the work has been done on herpesvirus, adenovirus, and vaccinia virus, but other viruses include measles virus, coxsackievirus, polio virus, newcastle disease virus, and more.[8][10] Methods of delivery tested include intratumoral, intravenous, intraperitoneal, and more.[11] Types of tumor that are currently being study with oncolytic viruses include CNS tumors, renal cancer, head and neck cancer, ovarian cancer, and more.[10] Oncolytic virotherapy as a monotherapy has also been tested in combination with other therapies including chemotherapy, radiotherapy, surgery, and immunotherapy.[8][10]

Approved for Clinical Use[edit]

In 2015 the FDA approved the marketing of talimogene laherparepvec, a genetically engineered herpes virus, to treat melanoma lesions that cannot be operated on; as of 2019, it is the only oncolytic virus approved for clinical use. It is injected directly into the lesion.[12] As of 2016 there was no evidence that it extends the life of people with melanoma, or that it prevents metastasis.[13] Two genes were removed from the virus – one that shuts down an individual cell's defenses, and another that helps the virus evade the immune system – and a gene for human GM-CSF was added. The drug works by replicating in cancer cells, causing them to burst; it was also designed to stimulate an immune response but as of 2016, there was no evidence of this.[14][12] The drug was created and initially developed by BioVex, Inc. and was continued by Amgen, which acquired BioVex in 2011.[15] It was the first oncolytic virus approved in the West.[14]

Others[edit]

RIGVIR is a virotherapy drug that was approved by the State Agency of Medicines of the Republic of Latvia in 2004.[16] It is wild type ECHO-7, a member of echovirus family.[17] The potential use of echovirus as an oncolytic virus to treat cancer was discovered by Latvian scientist Aina Muceniece in the 1960s and 1970s.[17] The data used to register the drug in Latvia is not sufficient to obtain approval to use it in the US, Europe, or Japan.[17][18] As of 2017 there was no good evidence that RIGVIR is an effective cancer treatment.[19][20] On March 19, 2019, the manufacturer of ECHO-7, SIA LATIMA, announced the drug's removal from sale in Latvia, quoting financial and strategic reasons and insufficient profitability.[21] However, several days later an investigative TV show revealed that State Agency of Medicines had run laboratory tests on the vials, and found that the amount of ECHO-7 virus is of a much smaller amount than claimed by the manufacturer. In March 2019, the distribution of ECHO-7 in Latvia has been stopped.[22]

Challenges and Future Prospective[edit]

Although oncolytic viruses are engineered to specifically target tumor cells, there is always the potential for off-target effects leading to symptoms that are usually associated with that virus.[7] The most common symptom that has been reported has been flu-like symptoms. The HSV virus used as an oncolytic virus has retained their native thymidine kinase gene which allows it to be targeted with antiretroviral in the even of unwarranted side effects.[8]

Other challenges include developing an optimal method of delivery either directly to the tumor site or intravenously and allowing for target of multiple sites.[8] Clinical trials include the tracking of viral replication and spread using various laboratory techniques in order to find the optimal treatment.

Another major challenge with using oncolytic viruses as therapy is avoiding the host's natural immune system which will prevent the virus from infecting the tumor cells.[7][8] Once the oncolytic virus is introduced to the host system, a healthy host's immune system will naturally try to fight off the virus. Because of this, if less virus is able to reach the target site, it can reduce the efficacy of the oncolytic virus. This leads to the idea that inhibiting the host's immune response may be necessary early in the treatment, but this is brought with safety concerns. Due to these safety concerns of immunosuppression, clinical trials have excluded patients who are immunocompromised and have active viral infections.

Viral gene therapy[edit]

Viral gene therapy uses genetically engineered viral vectors to deliver a gene of interest to target cells. An AAV-based vector is shown in this example.

Viral gene therapy uses genetically engineered viral vectors to deliver therapeutic genes to cells with genetic malfunctions.[23]

Mechanism[edit]

The use of viral material to deliver a gene starts with the engineering of the viral vector. Though the molecular mechanism of the viral vector differ from vector to vector, there are some general principles that are considered.

In diseases that are secondary to a genetic mutation that causes the lack of a gene, the gene is added back in.[24][25][26] In diseases that are due to the overexpression of a gene, viral genetic engineering may be introduced to turn off the gene.[24] [27] [28] Viral gene therapy may be done in vivo or ex vivo.[23] [29] In the former, the viral vector is delivered directly to the organ or the tissue of the patient. In the later, the desired tissue is first retrieved, genetically modified, and then transferred back to the patient. The molecular mechanisms of gene delivery and/or integration into cells vary based on the viral vector that is used.[23] Rather than

delivery of drugs that require multiple and continuous treatments. Delivery of a gene has the potential to create a long lasting cell that can continuously produce gene product.[24]

Clinical Development[edit]

There has been a few successful clinical use of viral gene therapy since the 2000s, specifically with adeno-associated virus vectors and chimeric antigen receptor T-cell therapy.

Approved for Clinical Use[edit]

Adeno-associated virus[edit]

Vectors made from Adeno-associated virus are one of most established products used in clinical trials today. It was initially attractive for the use of gene therapy due to it not being known to cause any disease along with several other features.[29] It has also been engineered so that that it does not replicate after the delivery of the gene. [29]

- In 2017, the FDA approved Spark Therapeutics' Luxturna, an AAV vector-based gene therapy product for the treatment of *RPE65* mutation-associated retinal dystrophy in adults.[30][31] Luxturna is the first gene therapy approved in the US for the treatment of a monogenetic disorder.[30][32] It has been authorized for use in the EU since 2018.[33]
- In 2019, the FDA approved Zolgensma, an AAV vector-based gene therapy product for the treatment of spinal muscular atrophy in children under the age of two.[34] As of August 2019, it is the world's most expensive treatment, at a cost of over two million USD.[35] Novartis is still seeking marketing approval for the drug in the EU as of 2019.[35]

In additional, other clinical trials involving AAV-gene therapy looks to treat diseases such as Haemophilia along with various neurological, cardiovascular, and muscular diseases. [29]

Chimeric antigen receptor T cells[edit]

Chimeric antigen receptor T cell (CAR T cell) are a type of immunotherapy that makes use of viral gene editing. CAR T cell use an ex vivo method in which T lymphocytes are extracted and engineered with a virus typically gammaretrovirus or lentivirus to recognize specific proteins on cell surfaces.[24] [36] This causes the T-lymphocytes to attack the cells that express the undesired protein. Currently two therapies, Tisagenlecleucel and Axicabtagene ciloleucel are FDA-approved to treat acute lymphoblastic leukemia and diffuse large B-cell lymphoma respectively.[24] Clinical trials are underway to explore it's potential benefits in solid malignancies. [24]

Others[edit]

In 2012 the European Commission approved Glybera, an AAV vector-based gene therapy product for the treatment of lipoprotein lipase deficiency in adults.[37] It was the first gene therapy approved in the EU.[38] The drug never received FDA approval in the US, and was discontinued by its manufacturer uniQure in 2017 due to profitability concerns.[39] As of 2019 it is no longer authorized for use in the EU.[37]

Challenges and Future Prospective[edit]

Currently, there are still many challenges of viral gene therapy. Immune responses to viral gene therapies pose a challenge to successful treatment.[40] However, responses to viral vectors at immune privileged sites such as the eye may be reduced compared to other sites of the body.[40][41] As with other forms of virotherapy, prevention of off-target genome editing is a concern. In additional to viral gene editing, other genome editing technologies such as CRISPR gene editing have been shown to be more precise with more control over the delivery of genes.[24] As genome editing become a reality, it is also necessary to consider the ethical implications of the technology.

Viral immunotherapy[edit]

Viral immunotherapy is the use of virus to stimulate the body's immune system. Unlike traditional vaccines, in which attenuated or killed virus/bacteria is used to generate an immune response, viral immunotherapy uses genetically engineered viruses to present a specific antigen to the immune system. That antigen could be from any species of virus/bacteria or even human disease antigens, for example cancer antigens.

Vaccines are another method of virotherapy that use attenuated or inactivated viruses to develop immunity to disease. An attenuated virus is a weakened virus that incites a natural immune response in the host that is often undetectable. The host also develops potentially life-long immunity due to the attenuated virus's similarity to the actual virus. Inactivated viruses are killed viruses that present a form of the antigen to the host. However, long-term immune response is limited.[42]

Cancer treatment[edit]

Viral immunotherapy in the context of cancer stimulates the body's immune system to better fight against cancer cells. Rather than preventing causes of cancer, as one would traditionally think in the context of vaccines, vaccines against cancer are used to treat cancer. [43] The mechanism is dependent upon the virus and treatment. Oncolytic viruses, as discussed in previous section, is stimulate host immune system through the release of tumor-associated antigens upon lysis as well as through the disruption of the cancer's microenvironment which helps them avoid the host immune system. [8] CAR T Cells, also mentioned in previous section, is another form of viral immunotherapy that uses viruses to genetically engineer immune cells to kill cancer cells. [24]

Other projects and products[edit]

Protozoal virotherapy[edit]

Viruses have been explored as a means to treat infections caused by protozoa.[44][45] One such protozoa that potential virotherapy treatments have explored is

Naegleria fowleri which causes primary amebic meningoencephalitis (PAM). With a mortality rate of 95%, this disease-causing eukaryote has one of the highest pathogenic fatalities known. Chemotherapeutic agents that target this amoeba for treating PAM have difficulty crossing blood-brain barriers. However, the driven evolution of virulent viruses of protozoal pathogens (VVPPs) may be able to develop viral therapies that can more easily access this eukaryotic disease by crossing the blood-brain barrier in a process analogous to bacteriophages. These VVPPs would also be self-replicating and therefore require infrequent administration with lower doses, thus potentially reducing toxicity.[46] While these treatment methods for protozoal disease may show great promise in a manner similar to bacteriophage viral therapy, a notable hazard is the evolutionary consequence of using viruses capable of eukaryotic pathogenicity. VVPPs will have evolved mechanisms of DNA insertion and replication that manipulate eukaryotic surface proteins and DNA editing proteins. VVPP engineering must therefore control for viruses that may be able to mutate and thereby bind to surface proteins and manipulate the DNA of the infected host.

2009 (Aug 24) - NYTimes : A Virus's Debut in a Doctor's Syringe"

DISEASE An image of West Nile virus, which a researcher in New York injected into people with advanced cancer as part of an experiment in the 1950s.

Source : [HN01JE][GDrive]

By KENT SEPKOWITZ, M.D.

- Aug. 24, 2009

Ten years ago this week, New York found itself at the center of a major public health drama: in Queens, a mysterious illness was attacking older men who liked to garden.

The minute-by-minute excitement resembled that of the recent pandemonium caused by swine flu, but with an important difference: in those first late-summer days of 1999, the cause of the outbreak was unknown. It was not until Sept. 24, after three people had died, that the culprit was identified. It was the mosquito-borne West Nile virus, and investigators grimly declared that it had never been seen in the United States.

Well, not quite. America's first cases of West Nile were actually seen in the 1950s, on the Upper East Side of Manhattan. But these cases occurred among people with terminal cancer. And the vector was not mosquitoes but the syringe of a researcher at what is now Memorial Sloan-Kettering Cancer Center.

Sixty years ago, radiation and chemotherapy for cancer were in their infancy; if the surgeon could not cut a tumor out, things were just about hopeless. So the researcher, Dr. Chester M. Southam, was studying viruses for their cancer-killing potential. Studies had shown that a pathogen called the Russian spring-summer encephalitis virus could eradicate tumors in mice. Because that virus was considered too dangerous for people, Southam searched for something milder, settling on the newly discovered West Nile virus.
The work was done in two bedded rooms separated from the rest of the hospital by an old-fashioned screen door. Dr. Donald Armstrong, attending physician emeritus at Memorial Sloan-Kettering who was a trainee at the time, said the screens were placed to minimize the possibility that a rogue mosquito would transmit virus to other patients or staff members. Southam injected West Nile virus into more than 100 people with advanced cancer and few treatment options, then reported his findings in journals. The work generated substantial excitement. "Deep Cancers Temporarily Shrunk by Rare Nerve Virus From Africa," The New York Times reported on April 15, 1952.

"Nerve virus" indeed: Southam had selected West Nile because he thought it would be harmless. In naturally occurring cases from Africa, it had caused only slight fever. But in New York, things turned out quite differently. Eleven percent became ill, and a few quite ill, with symptoms of what we now consider classic West Nile encephalitis: fever, weakness, confusion and even seizures. Virus was isolated from the cerebrospinal fluid of one patient, while in others it was cultured from blood more than three weeks after inoculation.

In one type of cancer, lymphoma, tumors did shrink in 3 of 8 injected patients, compared with just a few responses in the 100 with other types of cancer. But five of the same eight lymphoma patients developed severe West Nile disease, including encephalitis 🗣 a rate far higher than in everyone else.

So Southam moved on. Intrigued by the body's ability to destroy infection, he wondered whether it might be trained to control tumors. For the rest of his career, he worked in the novel field of immune therapy, now one of the most exciting areas in cancer therapeutics. His West Nile work, meanwhile, spawned its own field.

Current approaches are more sophisticated than the old days behind the screen door. For example, some investigators booby-trap a virus, then send it off to deliver its toxic package to the cancer cell. In others approaches, a virus is injected to provoke a general immune response. And in still others, the virus does what Southam had predicted: kills a tumor directly.
But rather than being revered as the father of viral therapy or as a patriarch in the field of immunotherapy, Southam became notorious for something entirely different. His enthusiasm for understanding how the immune system might be kick-started to control cancer nearly cost him his career. To study the immune response to cancer, he injected live tumor cells into people without malignancy; he selected 53 prisoners in the Ohio State Penitentiary and, years later, 22 elderly, dying patients in Brooklyn.

A 2004 essay by Dr. Barron H. Lerner in The New England Journal of Medicine recounted the "enormous controversy" that followed the Brooklyn episode. In a case brought by the state attorney general before the Board of Regents of the State University of New York in 1964, Southam was found to have committed "fraud or deceit" and unprofessional conduct. (Despite or because of this, he was soon elected president of the American Association for Cancer Research.)

The case became a flashpoint in the national debate about proper protection of human volunteers. Not that the idea was new to him: in one West Nile article, he noted that "all patients were volunteers and were informed of the experimental nature and the infectious nature of the virus inoculation."

Southam died in 2002, at 82. As it turned out, his greatest contribution to medicine was not his groundbreaking work in viral or immune therapies of cancer. Rather, he occupies the unenviable position of having focused public attention on the ethical problems related to clinical research 🗣 and, as such, was pivotal in the creation of our current system, in which highest priority goes not to the acquisition of medical knowledge but to the safety of human volunteers.

Major Clue Is Discovered In Leukemia Fight

By Frank Carey

WASHINGTON — AP — A new cancer research development which a senate group says foreshadows a likely major breakthrough in pinpointing the cause of leukemia became known in detail today.

The senate appropriations committee referred to the development in general terms in a report released yesterday. Commenting on it and other scientific findings reported in recent hearings, the committee said:

"Effective methods of prevention and cure (of leukemia) seem distinct possibilities in the light of several observations, some old and some new."

Perhaps the key finding—made so recently that the scientists involved have not yet had their findings published in medical literature—is that virus like particles found in the blood of some human victims of leukemia can apparently be made to "grow" in laboratory test tubes.

The development — climaxing three years of effort dating from the time when such particles were first found in leukemia patients—is a necessary prelude to pinning down whether the particles are truly viruses and whether, indeed, they are directly or indirectly involved in causing human leukemia.

Vaccine Possibility Raised

It could also be a first step toward trying to develop a vaccine against leukemia.

Officials of the National Cancer Institute supplied the information when asked by a reporter what the senate committee was referring to in its report when it said:

"The most profound and exciting research development reported to the committee in this year's (NCI appropriations) hearings is the likelihood of a major breakthrough in the identification of the casual agent for at least one form of cancer: The highly fatal leukemia of childhood . . . (there is) . . . most authoritative testimony that a viral causation of leukemia is very close to full, scientific proof."

The senate committee gave its views in a report to the senate recommending a $140,011,000 appropriation for the National Cancer Institute plus $10 million more for the institute's special cancer-virus research programs.

In answering questions, the NCI officials made available to a reporter their latest summary statement of the status of leukemia treatment and research.

In one section, the summary declared that there is an "intriguing long range prospect in view: The practical prevention of leukemia."

It was in this section that reference was made to the facts that:

1. At least five different mouse leukemia viruses are known today — but it was only after a "long and tedious process" that scientists learned to make them "grow" in quantity in the laboratory, for further research on them.
2. Virus like particles can now be demonstrated in at least 30 per cent of human sufferers from the acute leukemia of childhood.

Rep. Melvin Laird's Statement:

Proxmire's 'False Economy' on Cancer, TB Research

By REP. MELVIN R. LAIRD

One of the most rewarding experiences I have had during the time that I have been in Congress is membership on the Appropriations committee of the House of Representatives.

This is the committee which is charged with appropriating all federal funds and, historically, all appropriations for the federal government begin in the House of Representatives and then go to the Senate. When there are differences between the figures of the House and Senate the differences are resolved in a conference between the two bodies and when a final figure is arrived at it is sent to the President and when he approves it it becomes law.

During the past few weeks I have been distressed about Sen. William Proxmire's deliberate attempt to misrepresent the health research program of our government.

Proxmire Disagreement

fully understand and I might add that his colleagues in the Senate apparently did not understand either for they voted against his proposal and left the funds in the bill.

* * *

Another of the cuts Mr. Proxmire proposed was a request of $4.5 million in funds for the control of tuberculosis in the (50) states.

Now, let us see from the record of the House and Senate why these funds were in the bill and what the effect of their elimination would have been had they been eliminated.

The report of the Appropriations committee of the House of Representatives, of which I am a member, says, "The budget for 1964 actually re-

Proxmire's Disagreement

I have the privilege of serving on two subcommittees of the House Appropriations committee. One of them is the subcommittee on the Department of Defense and the other is the subcommittee on Labor, Health, Education, and Welfare. As ranking member of my party on this latter committee I would like to speak today about the health programs for two reasons.

● The first reason is that they affect the present and future health of all Americans and they do so by providing the funds for medical research and for the control of diseases in the several states.

● The second reason is that Sen. Proxmire and I find ourselves in disagreement on these appropriations from year to year and this year I would like to discuss some of our differences in detail so that you might have the opportunity of assessing the facts yourselves and coming to your own conclusions about the merits of the two positions.

This year, after the House of Representatives had acted on the appropriations for Public Health, the Senate took up the bill.

When the bill reached the Senate floor for debate Mr. Proxmire proposed substantial reductions in the health provisions of the bill. He introduced an amendment which, among other things, provided for a reduction of $10 million in cancer research and $4.5 million in the control of tuberculosis in the states.

Now, while I agree that Sen. Proxmire is not a member of the subcommittee in the Senate that hears the witnesses and receives the evidence on which appropriations are made for health purposes, he does, however, have access to the hearings of the committee and to the report of the committee which explains for everybody who is to vote on the bill, why and how the conclusions of the committee were reached.

Proxmire's Amendment

The $10 million which Mr. Proxmire sought to remove from the bill was proposed to the committee by the Acute Leukemia Medical Task Force of the National Cancer Institute, after the House hearings had been concluded and after the House had acted on the bill. The Senate report explains that the purpose of the appropriation of the $10 million is to carry out a special cancer virus research program.

The report states, "The most profound and exciting research development reported to the committee in this year's hearings is **the likelihood of a major breakthrough in the identification of the casual agent for at least one form of cancer: the highly fatal leukemia of childhood.**

"The committee recognizes that over many years, the research attack on cancer has been marked by a number of up-cycles of hope but that in the end, the disease generally has continued to resist understanding, prevention, or treatment. There is reason, therefore, for caution at this time. But the committee, **nevertheless, must report most authoritative testimony that a viral causation of leukemia is very close to full, scientific proof."**

The report goes on to state, **"Leukemia is a serious disease problem in this country today. Among children aged 4 to 14, it ranks second only to accidents as a cause of death . . .**

"Without treatment, only 5 per cent of children survive as long as one year. The disease today is unpreventable, incurable, usually fatal."

The report then goes on to quote one of the most eminent scientists in the virus field, a man who some years ago received the Nobel Prize for his work in virology. He says, **"I believe that virus-cancer research during the past year or so has become the brightest and potentially most productive area in all of cancer research.**

SEN. WILLIAM PROXMIRE

"The discovery that several viruses could be isolated from human cancer material and that to date none of these are the same as any known virus places a severe obligation on us as scientists to determine whether or not these are the causative agents of human cancer. Needless to say, this is an exceedingly difficult problem and will require additional developments if firm proof is to be obtained."

And again he says, **"The priming of research in this area has paid very rich dividends and within the past few months there has been a virtual avalanche of very important new findings which should be developed vigorously. In order to do this it will be necessary to develop production facilities for expanded cultivation of human and other cells in tissue culture and to develop expanded facilities for the growth of these newly isolated viruses in sufficiently large quantity to permit their complete identification."**

The committee report, itself, then goes on to say, "Testimony presented by the director of the Cancer Institute and others strongly supports the need for immediate intensification of research on the viral origin of cancer and with particular reference to the opportunities immediately available in the leukemias.

"The $10 million recommended to support this special cancer virus research program has been decided after much consideration of the testimony of Institute and special witnesses. It will permit a sound start in an effort that may prove not only costly and difficult, but also dangerous to the researchers, for it involves the concentration of viruses to a high degree and perhaps the removal of factors that prevent their transmission in nature."

Sen. Byrd's Report

REP. MELVIN R. LAIRD

Rep. Melvin Laird (R-Marshfield) is the 1964 Albert Lasker Foundation Health Research Award winner. It is the highest Health Research Award in the nation and in the last 15 years has been given to only three public officials. The award was made to Laird in New York last May.

Laird has been cited for his health work by the American Cancer Society, the National Mental Health Assn., the American Assn. of Medical and Dental Colleges, the National Assn. to Prevent Blindness and other organizations.

Cancer Research Centers called "Lairdettes" have been constructed at 14 locations in the United States. Laird was credited for obtaining the federal funds for the construction of the new 11-story McArdle Laboratory for Cancer Research of the University of Wisconsin's Medical School, one of the 14 "Lairdettes." He was appointed by both President Eisenhower and President Kennedy to the U.S. delegation to the World Health Organization.

He said, **"Mr. President, we stand on the threshold of exciting new discoveries in the field of prevention and treatment and cure of leukemia. Recent developments have been so rapid that we have had to use the approach here used.** The information that was brought to the attention of the committee was not known in time for a request to be made to the Bureau of the Budget and thus to travel through the normal channels. So it came to the committee in the form of a special report."

"Two hundred and ninety thousand persons die annually from cancer. Of these 290,000, approximately 15,000 die from leukemia, mainly children. Heretofore, and today, leukemia was and is considered to be an incurable disease, although considerable progress has been made in recent years with respect to the development of palliative drugs, drugs which will delay the development of the disease. **But up until this point, there is no known, sure cure for leukemia.**

"Leukemia is the second greatest killer of children, ranking second only to accidents. In the recent past, children afflicted with leukemia could be expected to live only for a very few weeks. Then the average period of life was extended through drug therapy to 6 months. I think about 80 children have been treated with various new drugs and have lived for a period of 5 years subsequent to the initial discovery of the disease.

"So we have been making some slow progress, but, as I say, recent scientific discoveries have been brought to the attention of the committee. They have indicated that we do, indeed, stand at the door of what may be an exciting breakthrough in our effort to make war upon and conquer this dreadful disease.

"Mr. President, it appears possible that a vaccine may be developed, such as the polio vaccine, which can prevent the incurring of this disease. Time is of the essence, and it is necessary, if we are to take advantage of new discoveries, that we make this initial appropriation, which is the beginning of a 2 or 3-year 'crash' program.

"If efforts are successful in this regard, it is hoped that we shall have opened the doors to the prevention and cure of other types of cancer. It is felt this may be a model program for dealing with other types of cancer.

"IT WOULD BE A GREAT MISTAKE FOR THE SENATE TO ADOPT THE AMENDMENT OFFERED BY THE SENATOR FROM WISCONSIN, MR. PROXMIRE, IN THIS REGARD IN PARTICULAR, AND IN OTHER REGARDS AS WELL, BUT ESPECIALLY IN RESPECT OF THIS ITEM.

"The subcommittee and the full committee, I think unanimously, favored this item. I do not recall that any attempt was made in the full committee to delete the item, and I was present when the subcommittee marked up the bill. Unfortunately, the senator from Alabama (Mr. Hill) was not able to be present when the full committee acted.

"All who spoke on it spoke enthusiastically about it. I do not recall any item that has ever been before this committee or any other subcommittee or committee of which I have been a member in the 12 years I have been in the House and Senate that has been so enthusiastically and unanimously received—certainly as far as the full committee and subcommittee were concerned—as was this item.

"IT WOULD BE A GRAVE, UNTHINKABLE AND UNFORGIVABLE ERROR FOR THE SENATE TODAY TO APPROVE THE AMENDMENT WHICH HAS BEEN OFFERED BY THE SENATOR FROM WISCONSIN TO STRIKE THIS ITEM FROM

duced this activity (control of tuberculosis) approximately one half million dollars below the 1964 level. If there ever was a proposal that was penny wise and pound foolish this is it. This is borne out by testimony both of officials of the U. S. Public Health Service and public witnesses, and in the paragraphs which follow the economics of the situation are pointed out by the committee.

SEN. HARRY BYRD

"Last year the committee again expressed its concern over the apparent lack of effectiveness of efforts to control tuberculosis in the United States.

$239 Million Saving

"Costs for tuberculosis hospitalization are now approximately $335 million per year. **The program the Task Force recommends would reduce this cost to an approximate $96 million in that 10th year, a saving of $239 million. Not to invest the funds necessary to carry out this program, which would be even less money over a 10-year period than can be saved in that 10th year alone would, in the opinion of the committee, be sheer financial folly and the essence of false economy."**

If the incidence of tuberculosis were dropping at the rate that it should be, it may be that these funds would be unnecessary but as the senator managing the bill on the Senate floor said, **"Mr. President, I call attention to the fact that more than half of the 53,315 tuberculosis cases reported in 1962 involved persons over 45 years of age. I also call attention to the fact that 6,000 of these cases involved children younger than 15 years of age.** These 6,000 children had active cases of tuberculosis. They were not just tuberculin reactors. They were active cases. Some of them had the adult type of pulmonary tuberculosis.

"Those are but a few of the recommendations that have been made by the task force on tuberculosis.

"THE SENATOR FROM WISCONSIN SPEAKS ABOUT PEOPLE DOWNTOWN AND WHAT THEY RECOMMEND. HE HAS INDICATED THAT THE PEOPLE DOWNTOWN FEEL THAT THE AMOUNT OF MONEY RECOMMENDED IS MORE THAN IS NEEDED."

"MR. PRESIDENT, THE PEOPLE DOWNTOWN TO WHOM THE SENATOR REFERS ARE CLERKS IN THE BUREAU OF THE BUDGET. THEY ARE NOT MEDICAL EXPERTS. THEY ARE NOT PEOPLE WHO CAN COMPETENTLY SPEAK TO THE SUBJECT. THEY ARE CLERKS, AND THEY HAVE VARIOUS RESPONSIBILITIES. OF COURSE, THEY CANNOT SPEAK AS CAN EMINENT PHYSICIANS, SCIENTISTS, AND MEDICAL PEOPLE WHO APPEARED BEFORE THE COMMITTEE, WHO HAVE RECOMMENDED THE APPROPRIATION, AND WHO FEEL THAT IT IS NECESSARY IF WE ARE TO REGAIN THE GROUND THAT WE HAVE LOST, FOR WE HAVE BEEN LOSING GROUND. I TRUST THAT THE RECOMMENDATION OF THE COMMITTEE WILL BE UPHELD BY THE SENATE."

Defeated 79 to 6

The amendment of Mr. Proxmire to reduce the health funds in the bill, including the two items I have discussed in detail, was defeated by his colleagues by a vote of 79 to 6.

In other words, 79 of his 85 colleagues who were present found the facts to be different than he stated, found the testimony of the medical experts sound and found that these programs were vital to the well being of the American people.

I agreed with them and, in fact, with the Senate, I supported the position they took.

As I try to understand the position of Mr. Proxmire on these health programs this year and in the years prior to this, sometimes I am of the opinion that he just doesn't understand the problem. The testimony is available for him to read, the reports of the committees are available to him, and he has the benefit of the debate on the floor of the Senate but it appears to me that he may not be able to fully understand what is meant by the statements and positions of the eminent experts who bring these problems before us as medical persons for us to vote on as legislators.

At other times I wonder if Mr. Proxmire is being completely honest with the people of Wisconsin in the position he takes in the Senate. For, as we go back several years we can note that year after year he offers amendments to reduce the health programs of the nation and invariably fails to do so.

It makes me wonder sometimes if he does not introduce these amendments in the full knowledge that they will not be enacted but that they will mislead the people of Wisconsin into thinking that he is making an honest effort to reduce the cost of government. I can't fully make up my mind what the motive is for his actions but whether these actions flow from ignorance or insincerity I leave for you to decide.

Since I have come to Congress I have worked and hoped for a balanced budget and I will continue to do so as long as I am a member of the Congress. I feel that the whole budget should not only be balanced but that it should be reduced and balanced, and the record will show that I have been steadfast in this position and I shall remain so.

Within the framework of a balanced budget, however, I will support programs vital to the health of the people of this country. The record will show that

The senator managing the bill on the floor of the Senate, Harry Byrd of West Virginia, went into more detail on this item in the debate on Aug. 19, and now I quote from the Senate proceedings of the Congressional Record of that day,

THE BILL."

How, in the light of these facts, these medical and scientific judgments, Mr. Proxmire felt constrained to attempt to do away with one of the most vital parts of our national health program I do not

I have done that in the past and you may be sure that I will continue to do so in the future.

I am glad to set the record straight on these programs and I hope that in this statement my position has been made clear.

Viruses Are Studied for Causes of Cancer

Tenth in a series.

By PAT McGRADY

In the spring of 1961, a few scattered scientists came up with an alarming conclusion: Many millions of people inadvertently had been exposed to a cancer virus hidden in polio vaccine.

The cancer causing agent was called Simian-Virus 40 (or SV-40) because it was one of many unidentified particles which existed naturally in kidney cells of Asiatic monkeys. There, it appeared completely harmless, the monkeys healthy, the cells undamaged.

But when SV-40 was added to cultures of kidney cells from African monkeys, the cells blistered, bubbled and died. In new-born hamsters, SV-40 produced cancers.

The polio virus is grown in monkey kidney cells and then either weakened or killed for vaccine. But the contaminating cancer-causing SV-40 virus survives the weakening and killing processes.

Vaccines Now Clean

Scientists estimate that a majority of the many millions vaccinated against polio up to the summer of 1961 received SV-40 in both oral and injected vaccines. U.S. vaccines since then have been clean. Vaccines used in the Soviet Union and Cuba were decontaminated later.

There is not the slightest direct evidence that SV-40 has induced cancer in any human. Adult volunteers had their noses and throats sprayed with SV-40, and suffered only mild, passing respiratory difficulty. Moreover, SV-40 failed to induce cancer in mice and rats.

It usually takes many years for cancer to appear in humans following contact with the cancer-causing agent, however, and it may be some time before the real consequences of SV-40 exposure are known. It is entirely possible that SV-40 may even have immunized people against some forms of cancer.

Newly developed facts have been found to place some of those inoculated against both polio and a respiratory disease in double jeopardy.

Drs. John J. Trentin and Yoshiro Yabe of Baylor University College of Medicine and Frank Taylor of M. D. Anderson Hospital, Houston, reported in the spring of 1962 that one type of adenovirus itself causes cancer when instilled in the lungs of newborn hamsters.

From five to 15 weeks following treatment, up to 90 per cent of the animals died of tumors which filled their chests.

In these experiments, the Trentin group used adenovirus 12. Others later induced experimental cancers with adenovirus 18 and adenovirus 7. Adenoviruses of types 3, 4 and 7 have been used in human vaccines. Two years after finding adenovirus 12 carcinogenic, the Trentin group produced a live vaccine against it; it was effective in hamsters and, to a degree, in mice.

Adenoviruses, first isolated in 1953 in human adenoids, are a common cause of respiratory infection among children and, even more so, among military service recruits.

Infections Differ

Adenovirus infection differs from the common cold in that its onset is more gradual and the symptoms are more severe and longer lasting.

One cannot say with certainty whether a person receiving a vaccine containing two distinct viruses—like SV-40 and adenovirus—each of which causes cancer in newborn hamsters, would run a greater risk than is offered by a single virus.

The SV-40 experience has indicated it might be a good idea to examine the long-term effect of all vaccines.

Vaccinia virus, like that received in smallpox shots, is commonly used to enhance the effect of carcinogenic chemicals in inducing cancer in experimental animals. Against this disquieting circumstance, however, are the irrefutable facts that immunization has virtually wiped out a plethora of plagues.

Back in the early 1940s a soft-spoken but fiery Spanish-born scientist proclaimed his belief that at least some human cancers were caused by ordinary viruses.

The scientist, Dr. Francisco Duran-Reynals of Yale University, stood virtually alone. His utterances represented heresy to the solid body of conventional science, against which cancer virologists found it expedient to pursue their studies quietly and apologetically. Not only was their line of investigation at stake but so were their jobs.

To physicians who knew viruses only as a scapegoat diagnosis the idea of linking common viruses and cancer meant that cancer was catching, and this, they reasoned, would make pariahs of cancer patients.

In his lonely campaign, Dr. Duran-Reynals confronted his silent, apathetic, or hostile peers with the meager history of cancer viruses in animals, his own elegant experiments, and a rapidly rising tide of findings by his younger contemporaries. Two years before his own death from an unusual malignancy which paralyzed him completely and which some felt might have been caused by one of his laboratory viruses, he had the satisfaction of hearing Dr. Wendell M. Stanley, of the University of California, one of science's leading figures, validate some of his sentiments.

The big question, which remains unanswered at this writing is: Do viruses cause human cancers?

Dr. Duran-Reynals, and Dr. Trentin showed that human viruses cause cancer—but only in animals.

Scientific proof that viruses do cause human cancers would entail rigid procedures. The virus would have to be (1) shown to be present in every case of the disease, (2) cultivated in pure culture, (3) made to produce the disease when removed from culture and inoculated into humans, and (4) recovered from the deliberately infected humans and grown again in culture. The law does not permit this.

Dr. Leon Dmochowski of the University of Texas M.D. Anderson Hospital has produced excellent electron micrographs of virus-like particles in many kinds of cancer cells—animal and human. Despite this persuasive evidence, however, he concedes that the case for viruses as a cause of human cancer is strictly circumstantial. The viruses are at the scene of the crime, but their guilt has not been proved.

Somewhere in the welter of the seemingly unrelated, often contradictory, always confusing observations, there must be a thread of logic. If the profound principles involved can be fathomed, man stands to gain a great deal. He can stop worrying about innocuous viruses and concentrate on what seems to be a mounting menace by harmful viruses. In 1950 only 21 human viral diseases were recognized; in a short dozen years the number exceeded 200.

One urgent problem is to determine if man is susceptible to animal cancer viruses and how such virus is transmitted. With this knowledge it might be possible to ward off some human cancers.

A fringe benefit has been the development of antiviral drugs. A few clever preparations—of limited value against cancers—already show promise of overcoming virus infections in animals and man.

We live in an atmosphere loaded with viruses—bad, inconsequential and good. Broad new vistas of preventing and treating virus disease are opening. Some of the findings have implications for controlling cancer—possibly and hopefully human cancer. (Copyright, 1965.)

Volume 76—No. 26 RIDGEWOOD, N. J., THURSDAY, JULY 1, 1965

Virologist Has Hope for Leukemia Cure

By PEG PETERSON

RAMSEY—Mice, hope and caution are the tools of Dr. Sami Mayyasi's trade.

A parent himself, he deals every day with a subject most parents try not to think about at all—leukemia. But he deals with leukemia in terms of hope, not despair.

The Ramsey man is part of a team of scientists at the Charles Pfizer and Company's cancer research center in Maywood, who are dedicated to the proposition that leukemia someday will be no more fearsome than polio is today. The Maywood laboratory—Pfizer's John L. Smith Memorial Center for Cancer Research—is under contract with the federal government's National Cancer Institute "to thoroughly study animal leukemia caused by virus with the goal that the same personnel will be skilled in the handling of leukemia virus if and when it can be isolated in humans," according to John L. Davenport, director of the Maywood center.

If the goal itself offers an implicit promise that leukemia can be conquered, Dr. Mayyasi is quick to check any runaway optimism. "There are those who say leukemia research today is about as far along as polio research was in the 1930s," he cautioned. But he himself puts it less starkly: "We probably are years away from a vaccine effective against leukemia in humans."

In any case, the assumed goal—a human vaccine—was brought some measure closer last year when Dr. Mayyasi and the group he heads succeeded in growing mouse leukemia virus in mouse tissue culture, establishing a self-perpetuating cell line for the cultivation of vaccine.

The Arabic-born virologist's achievement, announced at a Pfizer press conference late in the summer, sent a wave of excitement through newspaper and magazine science columns to a world hungry for any kind of progress in the battle against the fatal cancer which attacks bone marrow and the lymph nodes that manufacture blood.

Strains of leukemia virus in mice had already been isolated, including two strains with which Dr. Mayyasi worked—the strains isolated by Drs. John B. Moloney and Frank Rauscher Jr. both of the National Cancer Institute. And there had been previous successful attempts to vaccinate mice, but only with the virus taken directly from an infected mouse.

Breakthrough

Dr. Mayyasi's breakthrough was in utilizing, in his vaccination, the leukemia virus cultivated from tissue culture cell lines.

The significance is in the likelihood that the same mass production methods can be applied in development of a human vaccine . . . if and when a human leukemia virus can be isolated.

That's a tremendous "if and when." Cancer researchers at Pfizer and in labs all over the world are conducting probably the greatest virus hunt in history, racing against time and its death toll to find the virus which they strongly suspect—but have yet to prove—causes human leukemia.

Using powerful electron microscopes, the only instruments through which virus can be seen, workers at Pfizer and other labs are constantly examining blood plasma cells from human leukemia victims, searching for evidence of a virus.

Much of the study centers around the few, but very striking, evidences of a clustering of leukemia cases, primarily the outbreak in Niles, Ill., from 1957 to 1961 affecting eight children, seven of whom attended the same school while the eighth was a friend of one of the seven students.

Scientists also are much concerned with a condition called Burkitt's Lymphoma, a cancer of lymph tissues resembling leukemia, found among children living in a hot, moist section of East Africa. The climate suggests some transmission of the disease by insect carriers. Cell lines from tumors of those children are being studied.

Virus Suspect

It has been the few evidences of clustering, standing out sharply in what for the most part has been a random pattern, that has helped to put scientists on the trail of a virus. And what have they found beyond the mouse and chicken viruses?

There have been a number of discoveries of "virus-like" particles, in the plasma from human leukemia victims and in the tumors from the African lymphoma victims. Pfizer lab officials have explained: "Occasional virus-like particles have been observed in human plasma, and attempts are now being made to grow them in tissue culture and pin down the identification, as observation under the electron microscope is not positive by itself."

There's no doubt that many mouse leukemias are caused by virus, roundish with a squared-off tail, about 1/250,000th of an inch in size. And there's no doubt that the Mayyasi test-tube vaccine is effective.

Hundreds of mice have received injections of the dead vaccine developed from tissue culture and, subsequently, were injected with a leukemia virus. Ninety per cent of them were protected against the disease. All of the unvaccinated mice in the control groups developed leukemia after injections of the virus.

Safety Check

Dr. Mayyasi and others in the Pfizer virology department are concerned now with development of new safety-check methods—ways of testing the vaccine for purity to make certain the vaccine has no effects other than protection against leukemia, and freeing it of extraneous cellular material by chemical and physical means. Whatever lessons are learned from mice in that respect are almost certain to have importance when the time comes to check the purity and safety of a human vaccine.

About one-quarter of the some 200 employees of the Pfizer labs in Maywood are in the virology department, concerned with the role of virus in cancer. Meanwhile, others at the memorial center—which is named for a former Pfizer president who died of cancer—are concerned with other programs, including chemotherapy, the search for drugs having an effect on cancer.

Worked on Salk Vaccine

If a human vaccine is developed, it won't be the first time Dr. Mayyasi has had a role in an important vaccine program. Joining Pfizer in 1957, he worked first on Salk polio vaccine and influenza vaccine at Terre Haute, Ind. Four years later he went to Pfizer laboratories in Sandwich, England, to work with a group which perfected the Sabin polio vaccine.

On returning to the United States, he was appointed manager of vaccine development, heading Pfizer's live-virus measles vaccine program at Terre Haute. He and his family moved here, to 292 Elizabeth Ave., when he was assigned to the Maywood center in the summer of 1963.

Born in Haifa, Palestine, Dr. Mayyasi completed his high school education in Jerusalem and studied for three years at the American University of Beirut before coming to the United States in December of 1947. He studied at Ohio Northern University at Ada and received BS and MS degrees in bachteriology at the University of Tennessee in Knoxville.

He acquired a doctor of philosophy degree and a wife from Ohio State University at Columbus. A laboratory graduate assistant there, he was able to persuade an attractive co-ed named Elsie that the world could get along without her services as a nurse. "But I persuaded easily," laughed Mrs. Mayyasi, who studies piano and is active in the First Presbyterian Church.

The Mayyasis have two children, a son, Kim Arthur, and a daughter, Mona Lynn, students at Hubbard School.

Outside the lab, Dr. Mayyasi has a wide spectrum of interests including—well, just about everything except mice. Mice at home would be a bit much, so the family gets by with a parakeet, cat and fish in the pet department. Dr. Mayyasi plays tennis, swims in the Ramsey pool and is almost as handy around the kitchen as he is in a laboratory.

As an amateur chef, he specializes in preparing Near-Eastern dishes which he and his wife serve at Sunday open houses for the foreign students and physicians studying at Columbia Presbyterian Hospital in New York. The hospitality and the familiar food, the Mayyasis hope, make a foreign land a little less lonely for the students.

RELAXING AT HOME with his family, Dr. Mayyasi listens with his children, Kim Arthur and Mona Lynn while Mrs. Mayyasi reads. Their home is in Ramsey from which the virologist travels daily to Maywood for research work in the control of leukemia.

DR. SAMI MAYYASI examines the contents of a container while at work in the cancer research laboratories of Chas. Pfizer and Co. in Maywood. Dr. Mayyasi recently developed a vaccine which effectively protects mice against leukemia.

Dow to do cancer research project

THE BRAZOSPORT FACTS
FREEPORT, TEXAS Mon., July 19, 1965 7

The Dow Chemical Company has been awarded a contract by the Public Health Service, Department of Health, Education and Welfare, to develop methods of protecting personnel and preventing cross-contamination of experiments in virus-cancer research.

The work will be carried out by the Pitman-Moore Division of Dow at Zionsville, Ind.

Control of bio-hazards in virus research is one of four principal areas of investigation under a special virus-cancer-leukemia program for which the National Cancer Institute received a special congressional appropriation of $10 million for 1965.

1965-07-19-the-brazosport-facts-freeort-texas-pg-7-clip-cancer-research

The other areas to be investigated are . . . the cause and prevention of human leukemia, treatment of human leukemia, and animal leukemias and their possible relationships to man.

The contract with Dow is funded in the amount of $989,000.

A team of Dow scientists will design, construct and test full-scale models of new containment facilities needed for studies at the institute's proposed virus laboratory and animal facility in Bethesda, Maryland.

The company will also develop a system to monitor the safety of institute personnel, and maintain surveillance of experiments, equipment, and facilities involved in research projects.

The team, headed by Dr. Lawrence C. Weaver, will consist of virologists, microbiologists, veterinarians, pathologists, engineers and technicians familiar with the operation, design and construction of facilities used in advanced virus research. They will be based at the Pitman-Moore laboratories at Zionsville, Ind.

The Zionsville laboratories have been doing virus work for a number of years. Lirugen, a recently introduced, live-virus measles vaccine, was developed at the Zionsville facility, and the laboratories have been deeply involved in a wide range of human and veterinary medical research.

Appointed to Leukemia Committee

Armund E. (Art) Foley, of Hemlock Farms, Lord's Valley, Hawley, Pa., Director of Public Education and Information, Leukemia Society of America, Inc., has been appointed a member of the Organization Committee for the IVth International Symposium on Comparative Leukemia Research, to be held in Cherry Hill, New Jersey, September 21-25, 1969. The announcement was made by Ray M. Dutcher, Ph. D., General Chairman for the Symposium.

Mr. Foley has been associated with the Leukemia Society of America since March 1968. Prior to that time he was program promotion consultant for the CBA-TV series, "The 21st Century."

The Symposium will be principally co-sponsored by the Leukemia Society of America, Inc. and the Special Virus Cancer Program of the National Cancer Institute of the National Institutes of Health. More than 80 papers will be presented by scientists and physicians from throughout the world to the more than 500 attendees.

The Symposium is under the auspecies of the World Committee for Comparative Leukemia Research which is sponsored by the World Health Organization. This will be the first time the International Symposium will be held in the United States.

'No Generation Gap'

Leukemia drive launched here

A statewide campaign to raise funds for the Delaware Chapter of the Leukemia Society of America has opened.

Cochairmen of the month-long drive are Robert P. Barnett of 10 Pelham Road, Welshire, and Robert J. Marvel of 1930 Thomas Road, Fairfaz.

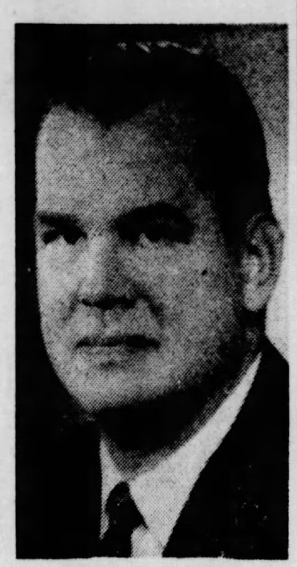
THEME of this year's campaign is "There Is No Generation Gap in Leukemia."

Barnett, a vice president of Atlas Chemical Industries, Inc., and general manager of its international division, noted that "no person is immune to leukemia. It strikes all age groups, races, nationalities and both sexes.

"It is one of the major causes of death among children in America," Barnett added, "yet the incidence of leukemia has been increasing especially in the age group over 40."

The Leukemia Society of America is a voluntary nonprofit organization with many chapters across the nation. It is dedicated to conquering leukemia through research as well as providing patient aid and public education. The Delawae chapter provides counseling and financial assistance to leukemia patients and their families.

Robert J. Marvel



Robert P. Barnett

The chapter's board of directors includes lay and professional volunteers from business, the medical and nursing professions, clergy, social workers, housewives and other interested citizens.

Marvel, who was the Wilmington Jaycee's Outstanding Young Man of the Year in 1968, is vice president of Brewer & Clement, Inc., local insurance firm.

HE pointed out the importance of the International Symposium on Comparative Leukemia Research, which will be held at Cherry Hill, N.J., Sept. 21-25. "This symposium." Marvel said, "is being sponsored by the special virus cancer program of the National Cancer Institute and the Leukemia Society of America, and should give an accurate and up-to-date report on the progress made by researchers toward solving this major disease."

Without the contributions of interested citizens, Marvel said, such research could be seriously impaired.

Contributions should be sent to the Leukemia Society, Bank of Delaware, P.O. Box 2366, Wilmington, Del., 19899.

Russian Research Links Viruses With Leukemia

CHERRY HILL (AP) — A Russian scientist reported yesterday on research in the Soviet Union supporting a theory that viruses can cause leukemia in humans.

An American scientist whose institute is supported by federal contracts promptly invited the Soviet specialist to repeat the experiment in the American laboratory.

Dr. Boris Lapin, an eminent Soviet virologist from the Institute of Experimental Pathology and Therapy at Sukhumi, described work done in his laboratory by an associate, Dr. L. A. Yakovleva.

Dr. Yakovleva, he said, produced "leukemia-like diseases" in monkeys by inoculating them with tissue and cell-free filtrates from humans with leukemia.

"Successful duplication of Dr. Yakovleva's work," the American scientist said, "could mark a significant step in establishing the possible viral causation of leukemia in man and animals."

The invitation came from Dr. S. S. Kalter of the Southwest Foundation for Research in Education of San Antonio, Texas, at the Fourth International Symposium on Comparative Leukemia Research.

No Difficulty Seen

According to the proposal, Dr. Lapin would use the foundation's laboratories to repeat the experiment. A spokesman said details would have to be worked out, but foresaw no difficulty.

American and Soviet scientists have worked in each other's laboratories in the past.

Dr. Kalter said it has been established that viruses can cause leukemia in numerous animals, but it hasn't been established that the same thing happens in humans.

If it does, some way of combatting the virus could presumably be developed sometime in the future.

U.S. Has Tried

Scientists at the conference said that researchers in the United States have long tried to produce leukemia in animals with specimens from human leukemia patients. The Americans have used newborn monkeys.

Dr. Lapin said the Soviet results came with pregnant adult monkeys. The adult monkey, he said, developed the disease 1½ years after the human leukemic material was introduced.

The Southwest Foundation is supported by federal contracts from the Special Virus Cancer Program of the U.S. National Cancer Institute, at the National Institutes of Health at Bethesda, Md.

The conference was sponsored by the Institute and the Leukemia Society of America, Inc., a volunteer organization.

Russians' cancer research may help leukemia patients

WASHINGTON — A Soviet cancer specialist has reported that baboons inoculated with material from human leukemia patients have developed a leukemia-like disease.

The research has caused excitement among American cancer specialists who have been trying to accomplish the same thing for years.

The New York Times
News Service 1969

The contents of the Russian research report were made known in Washington by spokesmen for the National Cancer Institute.

The Soviet scientist has been offered laboratory space in this country for experiments designed to confirm the Russian work. The objective of the research is to prove what many scientists suspect—that viruses are among the causes of human cancer. Proof of this would have profound effects on cancer research and, probably, on cancer prevention and treatment.

Leukemia, a form of cancer affecting the blood and blood-forming organs, is one of the prime suspects in the search for virus-caused human cancers. Natural leukemias in several animal species are known to be caused by viruses.

A major tactic in the search for proof has been attempts to produce leukemia in animals which were inoculated with cell-free material from human leukemia patients. Monkeys and baboons have been given special emphasis because of their close genetic relationship to man.

If human cancer viruses do exist they might cause the disease in monkeys or baboons.

In this country, several thousands of the animals have been inoculated with cell-free material from human cancers during the past several years, but no cases of leukemia have ever been found. In most of the American experiments newborn monkeys were used, while the Russian scientists used adult pregnant female baboons.

The scientists do not claim that the disease that has appeared in a few of the animals is leukemia. For the present, they call it a "leukemia-like" disease. Like human leukemia it is characterized by enlarged spleen and lymph nodes and small hemorrhages into the skin. The scientists also saw changes in the animals' blood and bone marrow resembling the effects of leukemia in man.

The Russion scientists also have reported finding particles in the animals' blood resembling a type of virus called C type virus which is among the prime suspects in human leukemia.

The Soviet report was made at the fourth international symposium on comparative leukemia research in Cherry Hill, N.J. It is sponsored by the special virus cancer program of the National Cancer Institute, Bethesda, Md., and by the Leukemia Society of America, Inc. The report was given by Dr. Boris Lapin of the Institute of Experimental Pathology and Therapy of the U.S.S.R. Academy of Medical Science. The author of the report was Dr. L. A. Yakovleva of the same institute.

Dr. S. S. Kalter of the Southwest Foundation for Research in Education, San Antonio, formally offered use of laboratories there to Lapin for experiments to confirm the results of the Russian research. The foundation is a contractor in the U.S. virus-cancer program. The National Cancer Institute described Lapin as an eminent virus specialist.

The report from the Soviet Union indicated that it took about 1½ years for classic leukemia-like symptoms to appear in three pregnant female baboons. The scientists had not been primarily interested in the mothers, but in their babies.

After the females were placed in a laboratory enclosure they developed the symptoms. Then other pregnant females not originally exposed to the human material developed the same symptoms. No theory was offered to explain why the effect should be produced in pregnant females while it failed to appear in other adults and newborns.

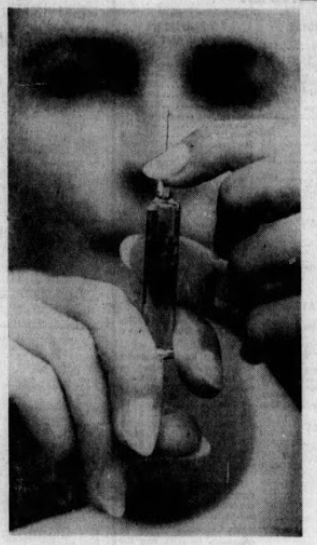
A Cancer Vaccine By 1973?

EXAMINER Showcase



HUMAN cancer cells are grown in rows of flasks at the Maywood N. J. laboratory of Charles Pfizer & Co. From these cells, researchers have isolated viruses they suspect can cause cancer.

By Edward Edelson

SCIENTISTS may be on the verge of attaining control of cancer.

It could take the form of vaccines to prevent specific malignant diseases, such as leukemia and cervical cancer. The first steps toward an experimental vaccine are being taken, and human testing on a small scale could start as early as 1973.

Or cancer control could come from a single injection designed to prevent all forms of the disease.

The key to both possibilities is the link between viruses and human cancer. Little more than five years ago, the evidence became so convincing that the federal government launched a two-stage research program; its aim was to prove whether viruses do cause human cancer, and if this was proved, then to do something about it.

This Special Virus Cancer Program is being handled in much the same way as the project that, in less than a decade, enabled the United States to land men on the moon.

Instead of testing one component at a time, Project Apollo engineers saved years by testing them all together in a single rocket launch.

IN THE SAME WAY, the virus cancer program is proceeding on a dozen different fronts at once—and if one approach begins to show promise, resources are shifted into it from less hopeful areas.

By this technique, program officials say they've achieved in two years what might have taken 10 or 15. Most scientists are convinced viruses do cause at least some human cancers. And effective ways to stop these viruses are within sight.

Right now, all that can be done about cancer is to find it as soon as possible and treat it with drugs, radiation, and surgery. Early detection has paid large dividends. In the 1940s, only one cancer patient in five lived five years or more after diagnosis. Today, one in three survives for at least five years.

But there is a narrow limit to what can be done after cancer strikes, and it appears that we are now close to the wall. The cancer survival rate, after moving up steadily for two decades, has not changed since 1956. The new frontier in research is prevention, not treatment.

After a long, slow start, the push toward prevention is now in high gear. One thing that held it back so long was the difficulty in determining the cause of cancer — or rather, in wading through a confusing abundance of suspected causes.

Radiation, sunlight, dyes, any number of chemicals — dozens in cigarette smoke alone — have been shown to cause cancer in humans or animals.

And then there are the viruses. These exceedingly small particles, which straddle the border between living and nonliving things, are actually parasites. They can reproduce only in living tissue, and are found in almost every living being, plant and animal.

For a long time, there seemed to be no reason for suspecting them as a cause of cancer.

FOR MANY REASONS scientists rejected the idea of a cancer-virus link even when suspicious evidence did appear.

In 1911, Dr. Francis Peyton Rous of the Rockefeller Institute reported he had transmitted cancer from one chicken to another by injection. The key had to be a virus, because the fluid he injected had been strained so everything larger than a virus had been removed.

Yet Dr. Rous' report was greeted with hostile silence. Physicians then were convinced a cancer was not contagious, and were simply not persauded Dr. Rous' findings were significant enough to divert research from its traditional channels.

Eventually, Dr. Rous was to get the Nobel Prize for his work — but not until 1966.

In the years between, scientists began finding literally dozens of cases of virus-caused cancer in animals. Viruses were isolated from diseased animals, grown in the laboratory, and injected into other animals to produce cancer.

Viruses were shown to be responsible not only for "solid" tumors but also for leukemias — the uncontrollable fatal disorders of the white blood cells — in rats, rabbits, frogs, hamsters and other species.

But for years, scientists could not detect any cancer-type viruses in human cancer patients.

Some researchers began to speculate that if viruses caused cancer, they must do it in hit-and-run fashion, so that by the time a person had cancer and someone tried to find the virus, it had done its work and fled.

Others believed failure to find viruses was imperfect detection methods. Finally, in 1957, Dr. Leon Dmochowski of the University of Texas M. D. Anderson Hospital and Tumor Institute at Houston turned his powerful electron microscope on the tissue of human leukemia patients—and found virus-like particles.

This became an important turning point; evidence implicating viruses in human leukemia piled up. By 1964 the National Cancer Institute became so convinced it asked Congress for a special research appropriation. It got $10 million for the first year and the Special Virus Cancer Program was under way.

It's now a major international effort.

Time (even in terms of hours) is of the essence, Dr. Frank J. Rauscher Jr. who heads the program, says.

ONE EVENING recently, scientists at the Maywood, N.J., laboratory of Chas. Pfizer & Co., received a call from a Salt Lake City physician who is cooperating in the work.

The physician had diagnosed leukemia in one of his patients and was about to start drug treatment. For cancer virus research, it is important to get cells from the patient before he gets any drugs. So by 5 a.m. the next day, a Pfizer representative was on his way to Salt Lake City for the samples.

Vaccine researchers are concentrating on three viruses as the source of potential vaccines. No one knows how many viruses there are. For instance, more than 100 are known to be involved in the common cold alone. Quite a few viruses are known to be associated with animal cancers; three are suspect in human cancers. But the three viruses on which the vaccine research is now focused have one important thing in common; they have actually been found in human cancer tissue or in the blood of large numbers of people with cancer.

THE FIRST of the three is called the Epstein-Barr virus after the two scientist who discovered it. It apparently causes a peculiar tumorous disease that accounts for half the cancer deaths among African children.

Scientists are also fairly sure the Epstein-Barr Virus (EBV) also is the cause of infectious mononucleosis.

"Mono" is a distressing — but definitely noncancerous — disease in which the white blood cell count increases slightly and briefly. Otherwise, mononucleosis and cancer are unrelated.

The EBV is now the prime candidate for a cancer vaccine. Researchers are working on ways to produce a killed-virus vaccine, similar to the Salk polio vaccine. The virus for such vaccines is killed so it doesn't infect anybody. But the dead virus still retains the ability to awaken the body's defenses and trigger the production of antibodies, which fight off live viruses if the vaccinated person is exposed to them.

The second virus involved in cancer vaccine research is called herpes type 2. This virus (and the EBV) happen to resemble the herpes-viruses, which cause cold sores, shingles, skin eruptions, and a variety of noncancerous illnesses.

Herpes type 2 has been found in a high percentage of women with cervical cancer.

The third virus is quite different from the first two. It's "the C particle," and it's a virus-like organism.

The C particle doesn't act like an ordinary virus, which usually invades a cell, takes over the cell's production facilities in order to make more viruses, then bursts and spills out its offspring viruses when the cell's manufacturing capacity is exhausted.

Instead, the C particle often enters a cell and disappears. And it spreads in an unusual way. Most viruses move horizontally from person to person, by coughs, sneezes, or in water and food.

The C particle appears to travel vertically, from mother to unborn child. The particle has been found to cause a number of different kinds of cancers in animals, and recently investigators have found human cancer cells with C virus in them.

SOME EXPERTS believe the C particle holds the ultimate answer to preventing all forms of cancer. One of the leading supporters of tihs view is Dr. Robert J. Huebner, who heads the solid tumor section of the government's Special Virus Cancer Program.

Dr. Huebner believes all animals and humans are born with the C particle. Ordinarily it doesn't do anything and something keeps the lid on. But this "repressor," as it is called, sometimes stops working, and the C virus becomes active. The result is cancer.

Dr. Huebner points out that cancer is primarily a disease of old age. Apparently, the repressor wears down or somehow stops doing its job as the years go by.

Scientists debate whether an ordinary type of vaccine would work if the C particle is at the root of all cancers. Dr. Huebner says if people are born with a C particle, they must be born with some tolerance to it and would reject the vaccine. Instead, he would like to start a program to find out what represses the C particle. Then an injection of the repressor could be used to control cancer.

"I feel we should do a moon-shot kind of effort on this to see if we're right," Huebner says.

6A ROCHESTER DEMOCRAT AND CHRONICLE Thursday, Feb. 12, 1970

'Awfully Close' to Cancer Link

D&C—New York Times

WASHINGTON—American laboratories will be asked by government researchers to make a big effort this year to grow large amounts of viruses, some of which are suspected of being among the causes of human cancer.

The virus production is needed to make decisive the rapidly accumulating evidence that some human cancers are caused by viruses. The search for proof has been one of the leading issues of modern cancer study and the objective of a major government research program since 1964.

"We feel we are awfully close," said Dr. Frank J. Rauscher Jr., director of that program during a recent interview. He heads the special virus-cancer program of the National Cancer Institute.

The search for human cancer viruses has narrowed down to a relatively small number of agents. Large quantities of these viruses in purified form are needed for the tests that may prove some of them cause some human cancers. Presumably the same technology needed to produce the viruses could later be valuable in making vaccines or other preventatives.

It has been estimated that 150,000 of the more than 600,000 cancers that develop in a year's time in the United States are of types that have been associated with viruses. It has not yet been proved that the viruses cause the cancers.

President Nixon's proposed budget for fiscal year 1971 more than doubles the funding of the virus-cancer program in the hope of proving cause-and-effect in some of those associations. The increase in funds would be about $20 million.

Rauscher said as much as $5 million could go toward increased production of suspected viruses and toward development of improved ways of producing them. Contracts are already in effect with major drug firms and other research organizations.

Science Report

Current Decade Called Crucial In Cancer War

1970-04-27-intelligencer-journal-lancaster-pa-pg-10-clip-cancer-war

By WILLIAM HINES

WASHINGTON — A recent speech by Dr. Jonathan E. Rhoads, president of the American Cancer Society, points up the progress made by medicine in this century — and also the progress still waiting to be made.

Speaking at a meeting of science journalists, Rhoads predicted that "the decade of the '70s will be as crucial in the war against cancer as were the 1880s and '90s with regard to infectious disease."

Hines

This sent some history-conscious reporters scurrying to the record books, where, among other nuggets of information, these were uncovered:

At the turn of the century, according to official U.S. Government vital statistics, the three top killer diseases were tuberculosis, pneumonia and diarrhea. Today these are far down the list of death causes and have been replaced at the top by heart disease, cancer and stroke, in that order.

TB, which in 1900 took 1,944 lives in every 1,000,000 population, now claims fewer than 40 victims per million. Pneumonia's death rate per million has fallen from 1,526 to 310, while diarrhea and enteritis have declined from 1,399 to 16.

As Rhoads indicated, the causes of most of the germ-caused infectious diseases were discovered in the last 20 years of the 19th Century (viruses came later), and vaccines and antitoxins came along soon afterward.

The history books show that typhoid's germ was isolated in 1880, TB's in 1882, diphtheria's in '83 and so on until by 1900, when the agent of dysentery was found, most of the really lethal microbes in the environment had been identified.

While vaccines and the like certainly helped to eliminate such scourges as diphtheria and scarlet fever, advances in public health were at least equally responsible. Public sanitation is incomparably better now than it was in great-grandmother's day.

Cancer-fighters think they may be close to a breakthrough now especially in some forms of this ailment which apparently are caused by viruses. A special virus cancer program at the National Institutes of Health in Bethesda, Md., is one of the few research efforts that has received increased funds in the federal budget for fiscal 1971.

In the old days, it often took a long time between discovery of cause and elimination of a disease. In the case of "childbed fever," 45 years elapsed from the time the Hungarian, Ignaz Semmelweis, identified this killer of new mothers as a form of blood poisoning and the isolation of the responsible germ.

Rhoads said breakthroughs can be exploited much more rapidly now than in the 19th Century, because then "we did not have computers, ultracentrifuges, supervoltage X-ray, molecular or genetic manipulation or other highly sophisticated devices." All these can now be brought to bear when it counts when promising research results are reported.

* * *

ADDITIONAL CANCER FACTS — In 1900 cancer took only 640 lives per million population. Today it takes 1600. Scientists believe a large part of this increase is due to the fact that people escape early death from infectious disease and live long enough now to catch the so-called "degenerative" diseases that top the killer list.

But there is also evidence that pollution of our environment may cause cancer, or speed up the cancer-producing processes of life. Despite whatever the tobacco industry may say, most scientists are now convinced that cigarette smoking causes lung cancer, and the cancer-causing properties of atomic radiaton are beyond dispute.

Although cancers strike virtually all vertebrate animals, tumors of the digestive tract are much more common in human beings than in lower species. Some scientists believe the fact that man is the only animal who cooks his food may have something to do with this.

Scientists Believe

Breast Cancer Virus Is Photographed

By JUDITH RANDAL

WASHINGTON — Increasingly convinced that a virus plays a role in human breast cancer, scientists think they have identified the villain and — using an electron microscope with a camera attachment — have taken its photograph.

What the scientists find particularly exciting is that the particle is virtually a dead ringer for a virus discovered by a scientist named John Bittner in 1934 and known to cause breast cancer in mice.

Since a great deal is known about the Bittner agent, the behavior of what is apparently its human counterpart may perhaps be quickly understood. Breast cancer is a leading killer of American women — 30,000 die of it each year in the United States — and it is not unknown in men.

AT A BRIEFING here in conjunction with a meeting of the Tissue Culture Association, Dr. George Todaro said that his colleague at the National Cancer Institute, Dr. Victor Zeve, has found the virus particle in test-tube-grown cells that were derived from the tumor of a woman who died of breast cancer at the Roswell Park Memorial Institute in Buffalo, N.Y. Dr. Stuart Aaronson, also at the National Cancer Institute, also participated in the work.

Quite independently, Todaro said, Dr. Dan H. Moore, at the Institute for Cancer Research in Camden, N.J., has found a few of the particles in another line of breast cancer cells obtained from a patient at the University of Pennsylvania School of Medicine hospital in Philadelphia and kept going in the laboratory.

Todaro, Zeve, Aaronson, Moore and other scientists frequently exchange information and ideas as participants in the National Cancer Institute's Special Virus Cancer Program, which organizes the research of its contractors and grant-recipients so that appropriate techniques are ready whenever a new link between virusts and human cancers turns up.

THIS IS particularly relevant in the case of what they believe is the newly discovered cancer virus, because similar particles have been found by Dr. William Feller of Georgetown University here in milk samples of women who have had one breast removed and then had a child and, in one instance, in the milk of a woman whose mother died of the disease.

More recently, Moore has found the particles in the milk samples of 6 of 90 healthy American women with no family history of brease cancer, 4 of 9 healthy women with such a history, and 9 of 24 samples obtained from healthy Parsi women in India and flown to this country for analysis.

Parsi women were chosen for the study because the sect has been inbred since the 8th century and breast cancer comprises 49 per cent of all female cancers in this ethnic group, Moore said in a telephone interview.

Furthermore, although the particles seen by Feller only resemble viruses known to cause cancer in animals, all those from women studied in New Jersey apparently are identical with those ferreted out in human breast cancer cell lines by the electron microscope, he said.

DR. DAN H. MOORE

MOORE keeps tab on those who are donors to his "milk bank" so that he can be sure to learn which, if any, of the women eventually develop breast cancer. In the meantime, however, experience with the Bittner mouse tumor virus strongly suggests that those whose milk samples now contain the virus are the most likely candidates for the disease.

The reason for this can be traced to what is known of the mouse virus. Nursing mice transmit this agent in their milk which ultimately leads to tumors in their offspring.

"There is as yet no real reason for women not to nurse their babies, but a similar mechanism in humans is a distinct possibility," Moore said.

Said another way, this means, according to current theory, that some of the genetic material of which the virus is composed is taken into the genetic material of the human egg and thus gets passed along from one generation to the next at the moment of conception. A mother whose genes are thus "contaminated" could transmit the virus in her milk so that her child at some time in its life — typically after 40 — would be particularly susceptible to the disease.

AN ORDINARY vaccine, designed as it is to prevent virus infection between one person and another, would of course be powerless against this process of "vertical transmission."

The Special Virus Cancer Program has foreseen this possibility and has commissioned a number of scientists to work out alternatives to immunization.

Perhaps the best known of these researchers is Dr. Sol Spiegelman of the Columbia-Presbyterian Medical Center in New York. Working with RNA viruses — those with a core of ribonucleic acid containing their genetic information and an outer protein jacket — Spiegelman has been able to reduce particles containing 330,000 units of hereditary information to a shadow of their former selves.

THESE abbreviated viruses are capable of successfully competing against their larger and more lethal counterparts, but incapable of causing disease. To date, he has experimented only with viruses that infect bacteria, but hopes are bright that the principle also will be applicable to man.

Since the Bittner virus and the virus found by Moore and Zeve are also RNA viruses — although of a slightly different type — the day may come when every baby, by being exposed to a "mini-virus" before birth, will have no need to fear breast cancer when he or she grows up.

Scientists on Trail of Cancer's Cause Seeking Proof in Virus Crop

By HAROLD M. SCHMECK Jr.
© 1970 New York Times News Service

WASHINGTON — American laboratories will be asked to make a big effort this year to grow large amounts of viruses in the hope of clinching the rapidly accumulating evidence that some human cancers are caused by viruses.

The search for proof has been one of the chief issues of modern cancer study and the objective of a major government research program since 1964.

"We feel we are awfully close," Dr. Frank J. Rauscher Jr., who heads the special virus cancer program of the Cancer Institute, said in a recent interview.

The search for human cancer viruses has narrowed down to a relatively small number of agents. Large quantities of the viruses in purified form are needed for the tests that may prove some of them cause some cancers.

Presumably, the same technology needed to produce the viruses could later be valuable in making vaccines or other preventives.

It has been estimated that 150,000 of the more than 600,000 human cancers that develop each year in this country are of types that have been associated with viruses. To date it has not been proved that the viruses cause the cancers.

President Nixon's proposed budget for the fiscal year 1971, beginning next July 1, more than doubles the funding of the cancer virus program in the hope of proving cause and effect in some of those associations. The increase in funds would be about $20 million.

Rauscher said that as much as $5 million of that could go toward increased production of suspect viruses and toward development of improved ways of producing them. Contracts are already in effect with major drug companies and other research organizations.

Significant Research

Several recent developments in research were cited by Rauscher as "profoundly important."

Among these was an achievement by Dr. Lloyd J. Old of the Sloan-Kettering Institute for Cancer Research in New York. He and his colleagues succeeded in growing human breast cancer tissues in the laboratory and have found in these growths particles that look like virus particles found in some animal breast cancers.

Systematic studies by Georgetown University and Charles Pfizer & Co., Inc., have been finding small viruslike particles in the milk of women who have breast cancer. Similar particles have been found with less frequency in the milk of women who do not have the disease.

These findings do not prove the cancers are caused by viruses, although the tendency toward breast cancer in some ani- Among their close relatives and close family contacts, 90 per cent had antibodies against those antigens, something much less common in the general population.

The evidence suggests that something transmissible, such as a virus, is involved in the disease. A key characteristic of animal cancer viruses is their ability to make the cells they invade start producing abnormal cellular antigens that are common from case to case, provided the virus is the same.

In New York, Dr. Old has been able to grow human sarcoma cells in tissue culture and has found the same characteristic antigens in them and in a wide variety of human sarcoma specimens.

Some of the new money is expected to go into studies of more sarcoma patients and more research on sarcoma tissue. It is expected that as many as 30 to 40 different sarcoma tissue cultures will be established within the next six months.

So far, the strongest and most suggestive association between human viruses and cancer appears to be that found in a type of cancer called Burkitt's lymphoma, which is common in some parts of Africa.

Insect Suspected

The geographical distribution of this disease has long suggested to doctors the possibility that it is caused by some transmissible agent carried by an insect. A virus usually called EBV has been found in close and almost invariable association with this disease.

This virus is similar to, although not identical with, previously known viruses of a group called herpes that commonly infect man. Herpes simplex virus, for example, is the agent present in common cold sores.

The EBV virus also appears to be closely associated with a cancer called nasopharyngeal carcinoma, common in some parts of Asia but relatively uncommon in the United States.

The same virus also now appears to be a major cause of infectious mononucleosis. Some doctors have said this noncancerous illness seems to act as though it were like leukemia that proved abortive and did not develop completely.

TODAY IN SCIENCE

Virus, Enzymes Among Subjects In Cancer Study

By LEILA HOLMES

We saw the landing of a man on the moon before 1970. Shall we see the cure for cancer before 1980?

By the late 1960s, the resolution for the moon landing was firm. The technology had been perfected, the achievement had been set as a national goal, and the only remaining question for scientists was "when?"

Dramatic promises for the answer to preventing cancer at a scheduled time are not being made.

Leila Holmes

Neither is a one-track national cancer goal being set, for there are so many avenues of cancer research, any one of which suddenly could lead to the solution.

It is true that early detection of cancer and its treatment by drugs, radiation, and surgery have improved and paid off in the last 20 years. In the 1940s only one out of five cancer patients lived for more than five years after diagnosis. Today, one in three passes the five-year mark.

RESEARCHERS across the country, including investigators in many departments at the Indiana University School of Medicine, are studying cancer from every angle.

Science so far has been able to cure most skin cancers to slow down the progress of the disease by improved treatment, and to urge prevention of more lung cancer by stopping cigarette smoking. This is only a drop in the bucket compared to the entire cancer question.

The chief research focus, whether studying individual cells or entire organ systems, is on prevention, not treatment. Development of vaccines to prevent specific types of cancer, such as leukemia or cancer of the cervix, would be sensational, and appear faintly on the horizon as real possibilities.

An even more remote, but not entirely unreasonable hope could be for a single injection which might prevent all forms of cancer.

The key to a vaccine becoming a reality could lie in the link between viruses and human cancer. Evidence of this linkage became so convicning five years ago that the Federal government launched a special virus cancer program, which now is proceeding on a broad front.

The National Committee of Consultants to Conquer Cancer, a recently established body of 26 members consisting of both scientists and laymen, is observing the cancer research picture closely.

AS ONE AREA of research shows great promise, this committee quickly shifts resources to that project and awaay from less hopeful ones. The virus area is one of the more promising ones just now.

While no infectious virus has been consistently isolated from human malignant tumors, several types of viruses have been found in human cancer tissue or in the blood of cancer patients.

Other specific viruses might be found if techniques are refined for isolation of viruses, which may be defective in nature and require "helper" substances to rescue them from tumors.

One virus apparently causes a tumorous disease, accounting for half the cancer deaths in African children, and so becomes the prime candidate for a cancer vaccine. This virus also has been found in Hodgkin's disease and a form of childhood leukemia.

IF THIS VIRUS does cause these diseases and a vaccine similar to the Salk polio vaccine can be successfully developed, the public could be immunized against the leukemias or blood cancers.

Another virus has been isolated from many women with cancer of the cervix. A vaccine for this type of cancer would represent the first preventive measure for maligant tumors.

A virus-like organism, recently seen in human cancer cells, and found to be the cause for certain animal malignancies, does not behave like an ordinary virus, and is even more intriguing to many scientists.

Instead of being transmitted from person to person, as with the common cold, or in water or air, it seems to be passed down from generation to generation.

SOME SCIENTISTS think that this virus, called "C particle," is present in all forms of animal and human life, but usually remains inactive or dormant because of a built-in repressor, an inhibiting agent.

Then, certain conditions, such as old age, radiation or chemicals, perhaps wears down the repressor, setting off the action of the virus. With nothing to stop its action, the virus then causes cell growth to go wild, producing cancer in all of its forms. If the repressor of the "C particle" could be determined, these scientists believe that cancer could be knocked out by an injection of repressor.

Biochemists believe that enzymes, small protein chemicals which reside within the body to regulate all of its chemical reactions, could be faulty or even missing in persons who develop cancer.

So researchers are probing enzyme systems to see if and how they could be related, then controlled to balance the chemistry of the body and stop the rampant growth of cancer cells. Enzyme deficiencies couuld be inherited, so family patterns are being followed by other groups.

An international symposium on enzyme regulation in normal tissues and in cancer, originated by Dr. George Weber, professor of pharmacology at the Indiana-Purdue University School of Medicine, met early this month on the medical center campus for its ninth consecutive annual meeting.

THE ROLE of hormones which are secreted by the endocrine glands, in speeding or slowing the growth of cancer are under scrutiny, too. At Sloan-Kettering Institute for cancer research and other research centers, hormones are being broken down into their small chemical components to provide information which could be useful in better understanding cancer.

Too, instead of removing the entire pituitary gland, which is responsible among other functions for growth, scientists at Sloan-Kettering, soon hope to be able to halt cancer by removing only the growth-promoting factor of the gland.

Thus, by leaving most of the gland intact, a better balance of glandular function will be maintained, and still the growth of the cancer stopped.

CELL BIOLOGISTS are looking at cell surfaces to see why cancer cells differ from normal ones and why they lose the ability to recognize overcrowding, and continue piling up on top of each other.

Enormous strides have been made in studying immune reactions, and how antibodies are formed to resist a foreign substance, perhaps even a wild cancer cell.

These are only a few of the many areas of cancer research, for which funds are needed. Even if research appropriations were unlimited, no one could promise that a cure would be achieved within five years. Yet, who knows? The cure could come tomorrow.

—'Rifampicin' May Have Cancer-Curbing Potential—

New Anti-Cancer Derivatives Being Tested in U.S.

By JUDITH RANDAL
Of the Washington Star

WASHINGTON — The National Cancer Institute is undertaking a crash program of drug testing that may enable it to close the gap between new research findings and dramatically better treatment for some forms of cancer in as little as a year.

At the same time, the work promises to advance the understanding of the fundamental nature of certain human malignancies, particularly the leukemias and cancers of the breast and bone. All of these have been linked to the same family of viruses, although no cause and effect relationship has been proved. Together, these disorders make up a significant portion of the annual cancer toll which is second only to heart disease as the nation's leading killer.

The drugs in the testing program are derivatives of an antibiotic called rifampicin which is made by the Italian drug firm Lepetit S.P.A. in Milan. The firm is making some 400 of these derivatives available to the NCI which is assigning the testing task in part to its own laboratories in Bethesda and its grantees at medical schools around the county and in part to scientists under contract to the institute's coordinating arm, the Special Virus Cancer Program (SVCP).

After preliminary screening of the compounds for their anti-cancer activity with test-tube samples taken from human tumors, the most promising of the lot will be subjected to animal tests. Then, if further scrutiny still shows them to be suitable, they will be given to patients on a trial basis.

The sudden focus on antibiotics for their cancer curbing potential is itself a dramatic example of how swiftly science can capitalize on new knowledge if the tools and resources are at hand.

Versions of rifampicin have been tested for some time against tuberculosis and several other bacterial infections, but as recently as three months ago few scientists had thought of them in connection with malignant disease.

The way was cleared for the new approach last spring when two biologists — Howard Temin of the University of Wisconsin and David Baltimore of the Massachusetts Institute of Technology — discovered independently since the tumor viruses known to cause cancers in animals behave in an unorthodox way.

Viruses are cores of genes clad in protein jackets. In a sense they are parasites for it is only when — having shed their protein jackets — they invade the nucleus of an intact cell to co-opt its genetic machinery that they can reproduce.

Once stripped for action, the ordinary virus gets a grip on the cell's DNA - deoxyribonucleic acid — the chemicals of wich its genes are made. The DNA then obediently turns out RNA — ribonucleic acid — and then proteins which are made to the specifications of the virus, enabling it to copy itself.

The tumor viruses studied by Temin and Baltimore, however, reverse this sequence of events. In the cells they invade, RNA makes DNA instead of vice-versa, and the DNA thus becomes the viral RNA's slave.

This is not altogether surprising since the tumor viruses themselves contain mostly RNA. Indeed, Temin predicted they would be found to have this talent in 1964. But the finding, which has since been confirmed by other laboratories, has caused a ferment in scientific circles.

There is a two-fold reason for this:

1. Temin and Baltimore found that animal cells infected by RNA tumor virus have a chemical catalyst or enzyme called "RNA-dependent DNA polymerase" which is not found in other cells.

2. Dr. Sol Spiegelman of the Frances Delaifield Hospital in New York, a star of the Special Cancer Virus program, and Dr. Robert C. Gallo and his colleagues at the National Cancer Institute recently discovered a similar enzyme in the tissues of leukemic patients, but have not been able to detect it in normal individuals despite intensive search.

Indeed, Spiegelman, after studying 120 patients, has learned that the enzyme disappears when the disease is in remission and becomes more and more plentiful when it becomes worse making its presence of absence a useful diagnostic tool in monitoring the effectiveness of therapy.

Furthermore — and this is where the rifampicin derivatives come in — Dr. Maurice Green of the St. Louis University School of Medicine, another SVCP participant, found in October that certain versions of the antibiotic block the activity of the enzyme in cancerous animal cells. From this came the current crash program to discover whether some of the compounds may exert a similar influence on human cancer cells and perhaps restore their behavior to normal.

The several forms of leukemia are, of course, the obvious candidates for such a strategy but Dr. Frank Rauscher, SVCP director, says he and his colleagues have no intention of letting it go there. "Collaborative efforts have accomplished in six months what would ordinarily take years," he says. "Why should we stop now?"

In animals, the leukemias are in general, associated with a class of viruses known as "C-type particles." The logical place to look, therefore, for other kinds of human cancer that might be suceptible to rifampicin derivatives is in tissue from the kinds of cancer in which these particles have been found.

The theory is that, like tissues from leukemia patients, these tissues should contain the telltale enzyme. So far the thinking has proved sound. In rapid succession, scientists have found the enzyme in conjunction with:

1. Sarcomas or malignant tumors of the bone and connective tissue.

2. Burkitt's lymphoma, a cancer of the jaw prevalent in Africa, but not unknown elsewhere.

3. Breast cancer, which, as the cause of 30,000 deaths a year, is the leading cancer killer of American women and also kills some men.

In some cases, admittedly, the evidence is not as airtight as in others. Scientists are convinced when they find the enzyme in tissue samples taken directly from cancer patients. But they feel on less firm ground when the samples used — while derived from human tumors — have been grown in test-tubes over long periods of time.

"There's always the danger that the enzyme is a contaminant when you're working with these cell lines," says Spiegelman. "This is the reason that the findings on breast cancer and Burkitt's lymphoma must be regarded as preliminary until further tests have been done."

Still Speigelman and other scientists connected with the project are confident that it will pay off.

The rifampicin derivatives, Spiegelman concedes, may prove too toxic to give to people in large doses, particularly those who are as sick as cancer patients often are. But this, he says, is no cause for gloom.

"Once we purify the enzyme," he says, "and learn enough about its structure, it should be relatively easy to design better drugs than those now available. We're not home yet, but we now have a handle on the problem we can use as a target, and this is something we have never had before."

The News (Paterson, New Jersey) · 24 Mar 1971, Wed · Page 17

Giant Step in Cancer Attack By Nucleonics

WASHINGTON, D.C.—Senator Harrison A. Williams Jr., announced that the National Cancer Institute of the National Institutes of Health has entered into an agreement with Electro-Nucleonics Laboratories, Inc., to supply up to $400,000 worth of highly purified live viruses associated with cancer in animals to be used for research in the institute's continuing effort to link viruses to the cancer process in man.

The Electro-Nucleonics Laboratories, Bethesda, Md., is a wholly owned subsidiary of Electro-Nucleonics, Inc., Fairfield, N.J.

Sen. Williams, chairman of the Labor and Public Welfare Committee, which handles medical research legislation, noted:

"The ability of Electro-Nucleonics Laboratories to produce large quantities of highly purified virus materials provides a concrete example of the impact that an increased budget for cancer research can have on the eventual unlocking of the cancer mystery."

Sen. Williams noted that the heart of the process is a zonal ultracentrifuge manufactured by the parent company in Fairfield. The device is an offshoot of atomic energy research, according to the company.

The project supervisor for Electro-Nucleonics Laboratories will be Irving Toplin, a biochemical engineer with long experience in the National Cancer Institute's special virus-cancer program. Electro-Nucleonics scientists have specialized in advanced techniques of propagating and purifying tumor viruses in large quantities.

Cancer-Virus Link Possible

(c) New York Times
Washington

Scientists in Texas have reported growing large amounts of virus from cells taken from a cancer patient suffering from a variety of the disease long suspected of being virus-caused.

The characteristics of the virus and the circumstances of its discovery suggest that the virus may be linked with the cause of the disease although this has not yet been proved. The research, supported by the special virus cancer program of the National Cancer Institute, is considered by some specialists to be a significant new lead in the search for human cancer viruses.

The work was done by cancer virus experts at the M.D. Anderson Hospital and Tumor Institute in Houston. A report is expected to be published soon in Nature, a British scientific weekly.

To date no human cancer has been proved to be caused by any virus, but many scientists believe this proof is only a matter of time away.

The ability to grow large quantities of the new suspected cancer virus is considered important because it should facilitate expanded research designed to pin down the viruses' role.

The new suspect is a spherical particle of a type called C Type virus. Recently viruses of this type have been reported found in specimens of at least five different kinds of human cancer, including breast cancer.

The new report links a C Type virus with one of the forms of cancer most widely suspected of being virus caused. This is Burkitt's Lymphoma, found most commonly in a region of Equatorial Africa where it is relatively common among children.

About a year ago doctors at M.D. Anderson Hospital succeeded in growing human cells from a specimen of fluid removed from an American child who was suffering from a form of the lymphoma. After 120 days they discovered that the cells in this laboratory tissue cluture were also releasing large numbers of virus particles in various stages of development.

Letters & Science

MEDICINE

Cancer Breakthrough?

Suspicion, as any detective knew, was one thing, but proof quite another — and much harder to assemble.

For years, biochemical researchers had suspected viruses as being cancer-causing agents. But viruses were ubiquitous in the tissues of men and animals, and the fact that any virus was directly linked to the cause of cancer in man had been extremely difficult to prove. Such links had been established with numerous cancers in animals. Yet the long-awaited proof that human cancers might also be virus-caused had remained elusive.

Human Virus

One obvious reason was the impossibility of injecting suspected cancer viruses into a human subject to see if they produced a tumor. Injecting such a suspected human cancer virus into any other species did not prove the point, since some viruses capable of causing cancer in one animal species under the right circumstances failed to do so in another species.

The complexities of the research were further compounded by the fact that some animal cancer viruses would appear in their recognizable mature form only when another type of virus was present. These were designated "helper" viruses because of their ability to assist the cancer viruses achieve mature form.

Burkitt's Lymphoma

Last week, however, a breakthrough on the path to proof was announced by researchers in Texas. A team of virus experts at the M.D. Anderson Hospital and Tumor Institute in Houston reported growing large amounts of virus from cells taken from a patient with Burkitt's lymphoma — a variety of the disease long suspected of being virus-caused.

About a year ago, doctors at the Anderson Hospital succeeded in growing human cells from a specimen of fluid removed from an American child who was suffering from a form of the lymphoma. After 120 days they discovered that the cells in this laboratory tissue culture also were releasing large numbers of virus particles in various stages of development.

The quantities were so copious that at least one virus particle was found in every cell studies, and examination of these viruses appeared to rule out the possibility that they were chance contaminants.

The suspect was a spherical particle of the group called a C-type virus. Recently, viruses of this type had been reported found in specimens of at least five different kinds of human cancer — including breast cancer.

The research, attributed to Drs. Elizabeth Priori, Leon Dmochowski, Brooks Myers and J. R. Wilbur, and supported by the special virus-cancer program of the National Cancer Institute, was considered by specialists to be a significant new lead in the search for human cancer viruses.

The characteristics of the virus and the circumstances of its discovery suggested that it might be linked with the origins of the disease. Furthermore, the ability to grow large quantities of the suspected cancer virus was considered highly significant, since it should greatly facilitate expanded research designed to pin down the viruses' precise role.

THE SCEPTRE of power for the nation's 1.1 million members of the National Education Association passed to the hands of Mrs. Catharine Barrett of Syracuse, N.Y., at the association's annual convention in Detroit last week.

ENVIRONMENT

Target: AAA

Ralph Nader, champion of consumer rights who had taken on such giants as Volkswagen and New York's First National Bank recently, moved his Raiders back into the environment picture last weekend and his targets were big again.

Nader opened an investigation of the 13-million member American Automobile Association and in a separate, personal action he appealed to the Nation's scientists to step out of the laboratories and accept social responsibility for cleaning up the country.

Nader said that the auto clubs had "a unique potential to act as consumer representatives for their members" but thus far they had aligned with the auto industry in "disdain" for automobile safety and pollution.

Conflict of Interest?

The investigation, he said, was started after "complaints from AAA members" and AAA policies which show a "potential conflict of interest . . . as a result of services they provide their membership, such as sale of insurance and auto accessories."

The investigators would try to determine who controlled AAA policies and "the potential of the auto clubs to make major contributions toward the health and safety of auto users."

Later, Nader, speaking at the Lawrence Berkeley Laboratory to physicists and graduate students, told the scientists they, too, could

DAILY NEWS, FRIDAY, SEPTEMBER 10, 1971

Find Fresh Clue of Viral Link to Hodgkin's Disease

By WILLIAM RICE
Science Writer of THE NEWS

Researchers at Sloan-Kettering Institute for Cancer Research have isolated two specific types of virus-like agents in the malignant cells of victims of Hodgkin's disease, a form of lymph cancer that strikes an estimated 5,000 Americans annually.

If the work announced yesterday proves out, it may represent a major step toward solving the mysteries of Hodgkin's disease and provide researchers with a tool they may use to test new drugs for combating it.

Dr. John Moloney, chairman of the National Cancer Institute's special virus-cancer program, described the work as "very exciting."

May Support Multivirus Theory

He said the findings not only would reinforce the belief that viruses and cancer are related but also could fit into the theory held by some that more than one virus may be needed in the development of some malignancies.

It does not, however, mean that a new cure is around the corner for this disease, which claims the lives of more than half its victims.

It has long been suspected that a virus may be connected with Hodgkin's disease, but proof of the relationship has eluded scientists.

Dr. F. Kingsley Sanders, virologist and a vice president at Sloan-Kettering Institute, 410 E. 68th St., said the discovery was made in tissues taken from 10 patients at Memorial Hospital for Cancer and Allied Diseases.

Using a unique metal grid to filter off toxic cells that have resisted previous attempts, Sanders and his fellow researchers were able to nurse the cells from malignant lymph tissues through up to 50 generations.

The scientists reported that the new cells produced ribonucleic acid (RNA) particles that apparently were viral in nature. They admitted, however, that they were unable to actually see a specific virus although the biochemical evidence of its existence was quite strong.

Then, Sanders and his colleagues reported, the cultures from two of the patients—an 8-year-old girl and a 52-year-old man—slowly stopped reproducing and developed signs of another virus form, later seen through an electron microscope and identified as a herpes-type virus similar to the virus that causes chicken pox and shingles.

This second virus was composed of deoxyribonucleic acid (DNA).

Both RNA and DNA are believed to contain the keys to a cell's ability to reproduce normally or to suddenly change into a rapidly producing chain of malignant cells.

Sanders, in an interview coinciding with the publication of his team's report in today's issue of Nature, the British scientific journal, carefully pointed out, however, that he was not claiming as yet that the two families of virus particles were the causes of Hodgkin's disease.

Sanders said that he now was interested in testing Hodgkin's disease victims and their relatives and contacts to see if any had developed antibodies signifying that they have been challenged by one or both of the virus types.

In June, New York State Health Department investigators claimed to have found a link among 13 cases of Hodgkin's disease victims in the Albany area and suggested for the first time that this form of cancer may be communicable.

The National Cancer Institute, however, quickly pointed out that the cluster of cases may have been the result of nothing more than chance.

Link Other Viruses to Cancer

Other viruses recently have been implicated with various forms of cancer, particularly leukemia, bone cancer, Burkitt's lymphoma and other forms of lymphoid malignancies.

While such discoveries have been hailed as the first slow steps toward the possible development of a cancer vaccine, scientists carefully warn that outside contamination of the test material always must be suspected and, even if a virus is finally proved to cause a particular cancer, it would be many years before a vaccine could be produced.

Working with Sanders were Drs. Magdalena Eisinger, Charles Young, Etienne de Harven, Lloyd Old, June Biedler and technician Sylvia Fox.

New Fighters Against Cancer Hold Promise

1971-09-18-the-tennessean-pg-b-8-clip-cancer

By JUDITH RANDAL
(C) 1971 Washington Star

PADUA, Italy — A crash program begun last January by the National Institutes of Health because of startling new findings in cancer research, has already turned up some two dozen drugs that in the same concentration are two to 10 times more harmful to leukemia cells than they are to healthy tissue.

Further work is needed to establish the safety and effectiveness of the compounds, but some may be given to patients whose illness is resistant to other treatment within a year.

A LONG DELAY is necessary because the preliminary work had to be done with cells isolated in test tubes and the crucial tests in animals are not yet complete. Nonetheless, scientists at the fifth International Symposium on Comparative Leukemia Research which met here this past week are impressed at the pace at which progress is taking place.

At a news conference, Dr. Robert C. Gallo of the National Cancer Institute, a branch of the National Institutes of Health, said that the 24 or so potential cancer fighters had been identified by screening more than 200 chemicals, all derived from an Italian drug called rifampicin.

RIFAMPICIN, he explained, has little antitumor activity itself, but has long been used in Europe for the treatment of tuberculosis and was recently licensed for this purpose in the United States. It is manufactured by the Gruppo Lepetit Co. in Milan which is also supplying the derivatives for research and a related drug called rifamycin. This is a chemical of known safety but questionable value in cancer therapy.

In its effort to leave no stone unturned, however, the National Institutes of Health plans tests of rifamycin on leukemia patients for whom other drugs have failed in the next two months.

Rifampicin and rifamycin came to the attention of the National Cancer Institute after the independent discovery in the spring of 1970 by two scientists — Howard Temin of the University of Wisconsin and David Baltimore of the Massachusetts Institute of Technology — that viruses known to cause leukemia and certain other malignancies in animals seem to owe their ability to enslave normal cells to an enzyme called RNA dependent DNA polymerase.

IN NOVEMBER, Gallo found a similar enzyme in cells from patients with acute leukemia and determined that the formation of the enzyme could be partially blocked in the test tube by rifampicin and completely destroyed by some of its derivatives. The cancer institute's Special Virus Cancer Program then committed itself to more intensive research on this family of drugs.

In the intervening months, scientists under contract to this program have not only discovered the enzyme in the cells of patients with leukmia, but have also come to suspect that it is a fellow-traveler of tumors of the bone and connective tissue and cancers of the lymph glands.

In addition, there is growing evidence that it may play an important role in breast cancer. Thus, although leukemia patients will probably be the first to benefit from rifampicin derivatives, if they are as promising as expected, other cancer victims may also be helped by the drugs.

BESIDES opening up new avenues of cancer therapy research, the recently discovered enzyme is deepening scientific understanding of the biological processes by which the various forms of cancer take hold.

At last week's meeting for example, more than a dozen papers were presented reporting progress in deciphering the structure of protein and in purifying and isolating its component parts. These advances, it was said, may lead to such advances as diagnostic tests specific for the many forms of cancer at an early stage and to many new strategies to control the abnormal cell activity characteristic of tumor growth.

Even more exciting is the distinct possibility of preventive vaccines.

AN IMPORTANT facet of current cancer thinking is the belief that if viruses are implicated in human tumors, which they almost surely are, in some instances at least their lethal potential is passed on from one generation to the next at conception.

Many scientists have felt this would render vaccines useless because the body would be incapable of recognizing inherited materials as possibly dangerous and would not, therefore, make antibodies to destroy them. However, it was reported by Dr. Jeffrey Schlom of the Columbia College of Physicians and Surgeons in New York, that several animal cancer viruses that behave similarly can be neutralized by vaccines. This being so, he said there is every reason to suppose that the same goal can be achieved for man.

The symposium on leukemia research is sponsored by the World Committee for Comparative Leukemia Research and the World Health Organization. Some 400 scientists from 17 countries came to Padua and Venice for the meeting.

Medical Scientists Find 'Likely' Candidate for Human Cancer Virus

LOS ANGELES (AP) — Medical scientists here have have discovered what they say "appears to be the most likely candidate yet" for a human cancer virus.

If their conclusions are proven correct by a battery of experiments now underway, the scientists' discovery would become a powerful new tool in the search for the dread disease's cause and a possible cure. It would be important new evidence supporting the still unproven idea that each person is born with the seeds of cancer and that a cancer virus particle helps "turn on" the disease.

The discovery by doctors at Los Angeles Childrens Hospital, the University of Southern California and the National Cancer Institute in Bethesda, Md., is certain to further fuel a quiet but intense controversy that has grown out of the search for a human cancer virus.

The Los Angeles group's findings are to be published in the Dec. 22 issue of Nature, the British scientific journal. The article will come five months after researchers at the M.D. Anderson Hospital in Houston, Tex., announced in July they had found the first human cancer virus.

But National Cancer Institute scientists who studied the M.D. Anderson findings published a paper in Nature in September claiming the virus is from a mouse and not a human virus.

Dr. Elizabeth S. Priori of M.D. Anderson Hospital said in a telephone interview she remains convinced her group's virus is not a mouse virus but that it may share some common properties with mouse virus. She said an article would be published "any day now" in Nature reporting studies with an electron microscope that show the M.D. Anderson virus is different from mouse virus.

The M.D. Anderson candidate is known as the ESP virus, after Dr. Priori's initials.

In another laboratory, strong evidence that a virus can cause breast cancer has come from Columbia University researchers Drs. Sol Spiegelman and Jeffrey Schlom.

Drs. Spiegelman and Schlom reported recently on biochemical research they say strengthens previous indications that virus-like particles are linked with human breast cancers.

The Columbia researchers have found virus-like particles in the milk of 60 per cent of 180 American women who came from families with a history of breast cancer.

Dr. John B. Molaney, head of the National Cancer institute's special virus program, confirmed the latest report of a possible virus, saying it indeed is a "candidate" for a human cancer virus.

In yet another study, a Georgetown University medical research team reported Sunday what it said was the first long-term maintenance in culture of a human malignant tumor in which large amounts of virus have appeared.

"It is the first time a C-type (cancer) virus has been observed in the primary tumor before culture and in the cell line after extended culture, Dr. Sarah Stewart, Georgetown pathology professor, told a news conference.

"We have a good share of the evidence to prove that we have a human virus and not one accidentally interjected from animals."

Although virus particles have been discovered in human malignancies before, Dr. Stewart said they have been unstable and have not been in sufficient quantity to work with.

"Our virus is growing in tissue culture," she said. "We now have the means to produce the virus in sufficient quantity to isolate, purify and work with it."

Dr. Moloney of the NCI said: "This is a very interesting finding by Dr. Stewart but she has an awful lot of control work to do. It must be determined whether the virus is human, certainly whether it is a causative factor in certain human tumors.

"She must develop certain controls to determine whether the virus particle is indeed human . . ." he said. "Those studies will be undertaken by other investigators in the special virus cancer program.

"But certainly until these results come in, we cannot say this is a human virus, no less a human tumor virus," Moloney said.

One of the NCI scientists who wrote the critical article on the M.D. Anderson virus claim is Dr. Robert J. Huebner of the NCI viral carcinogenesis branch. He and Dr. R. M. McAllister of Childrens Hospital, Dr. Murray B. Gardner of the University of Southern California and Dr. R.V. Gilden of Flow Laboratories, Inc., of Rockville, Md. are principal authors of the latest article.

They discussed their findings with science writers recently and explained why they think they have discovered human cancer virus.

"We think this is the best candidate so far detected to be the so-called human C-type virus," McAllister said.

The scientists have interpreted the data to be strong circumstantial evidence the cancer virus particles are of human origin.

Findings Support Cancer Theory

WASHINGTON (AP) — A team of Columbia University cancer researchers has reported some new test-tube findings which they suggest may strengthen the still-unproved concept what at least some human cancers are caused by viruses.

The three-man group, in a report to the technical journal Science, said they had found an apparent chemical compatability between genetic materials found in tissue cells from three types of human cancer and those found in viruses known to cause comparable malignancies in mice.

The three types of cancer are breast cancer, leukemia, and sarcoma — the latter being a form of malignancy that primarily affects connective tissue and includes such tumors as bone cancer.

The scientists made plain that, even if it is eventually proved that such human cancers are caused by viruses, it wouldn't necessarily follow that they are caused by the same viruses that can produce those same malignances in mice.

But they did suggest that their findings may mean this:

Since the genetic chemistry within the human cancer cells studied appears to be closely similar to that occuring inside viruses known to be able to cause comparable types of mouse-cancers, some still-unidentified viruses may be the basic cause of the human cancers.

The new experiments involved special studies of the genetic materials — DNA and RNA — that occur in the nuclei of all living cells, both normal and malignant. Together, these so-called nucleic acids — complementing one another — team up to control the way cells work and the way, indeed, inheritance is passed on from old to new cells, and from a generation of individuals to their offspring.

The Columbia researchers found that DNA produced from each of the three mouse-cancer viruses could very often be bonded chemically to RNA derived from cells of the human cancers. That is mouse-virus material and human cancer tissue material was combined.

Science In The News

Referring to the studies of human sarcoma tissues the scientists said:

"Although our experiments do not constitute definite proof of a viral etiology cause of human sarcomas, they provide rather compelling evidence for the presence in these human tumors of RNA similar to that found in an agent known to be related to a virus that causes sarcomas in an experimental animal."

They added:

"Whatever these results may ultimately mean for a viral etiology of human cancer, they do suggest a remarkable similarity in the specific virus-related information found in corresponding tumors of mice and men."

The researchers — of Columbia's Institute of Cancer Research — are Drs. Sol Spiegelman, Donald Kufe, and Rudiger Hehlmann. They said their study was conducted with the Special Virus Cancer Program (SVCP) of the government's National Institutes of Health.

Lemp named to tumor virus program post

John F. Lemp Jr., has joined Electro - Nucleonics Laboratories, Inc., of Bethesda, Maryland, as Director of the Tumor Virus Program.

JOHN LEMP JR.

He will be responsible for purification techniques and production of RNA tumor viruses and other sub-cellular materials that Electro-Nucleonics Laboratories provides to laboratories engaged in cancer research.

Much of the Electro-Nucleonics Laboratories' work in this area is performed in collaboration with the Special Virus Cancer Program of the National Cancer Institute.

Lemp comes to Electro-Nucleonics Laboratories with twenty years experience as a registered microbiologist in both private and government laboratories. He is a 1951 graduate in Microbiology from the University of Illinois and has been listed in "American Men of Science" for the past several years.

A resident of Lovettsville, Va., Lemp is the son of John Lemp Sr., 1627 Joesting, Alton.

An insight from chickens

ST. PETERSBURG, Fla. (AP) — Two scientists who hate chickens are learning, from those same chickens, new insights into viruses that cause cancers.

A main finding is that one virus can enhance or boost the effects of a second virus.

While no viruses have yet been proven to cause human cancers, the research is adding to such suspicions as these:

—That what ultimately happens to you from various virus infections may depend upon which virus came visiting you first.

—Prior infection with one kind of virus might confer some protection against later infection with a cancer-causing virus. Or the initial infection might boost the cancer-causing power of a second virus.

For example, some scientists think that an attack of infectious mononucleosis, the so-called "kissing disease," might make people less susceptible to leukemia later in life, if it turns out that leukemia is really caused by a virus.

The scientists who dislike chickens are Drs. Vincent Groupe and Jack W. Frankel, the director and deputy director of Life Sciences, Inc., a research and development laboratory here.

Some 600 chickens are continually being reared and maintained in the laboratory, and over years of close familiarity Groupe and Frankel have come to regard chickens with a good deal less affection than for a family pet, even to the point of preferring not to have chicken dinners at home.

But the chickens are a key to some basic research because they have been bred to be virus and germ free, or at least free of specific viruses known to be involved in cancers in chickens.

This had taken generations of breeding under aseptic conditions, in research supported by the Special Virus Cancer Program of the National Cancer Institute.

The result is chickens, and their eggs, free from viruses like the one that causes Marek's disease, a form of solid leukemia in chickens, bringing on paralysis and tumors within four to six weeks. It spreads easily within infected chicken houses, and hundreds of thousands of infected chickens are destroyed each year as unfit for human consumption.

If virus-free chickens are inoculated with Marek's virus, they don't get paralysis or tumors — they simply keel over and die within two weeks.

This raises the question whether some "activator" virus has to be present for Marek type cancer to develop, Groupe says, adding the role of mixed viral infections leading to cancer has never been considered before."

Using tissue cultures of virus-free eggs, Groupe and Frankel injected them with Marek's virus and with Avian Leucosis Virus — AVL — which causes a cancer in chickens.

They found that prior infection with AVL interfered with the ability of Marek's virus to cause changes in living cells. But the mixture produced more AVL particles than would result from growing Avian Leucosis Virus alone in the testtubes. Its action was enhanced. Thus, one virus may be a cause and another the activator in a cancer process.

Kindred experiments now are being conducted in virus-free chickens.

But far more than chickens is involved in the studies.

The Marek virus is a herpes virus, belonging to the family of viruses that cause ordinary cold sores and the nerve disease called shingles. A herpes virus has been implicated in some cancers of the cervix in women.

And in many ways, Marek's resembles a virus, the Epstein-Barr or E.B. virus, implicated in a human leukemia known as Burkitt's lymphoma.

Cancer Breakthrough Predicted

United Press International

WASHINGTON — Dr. Frank J. Rauscher, the new director of the National Cancer Institute, is confident that cancer research will lead to the prevention and successful treatment of the disease.

President Nixon announced Rauscher's appointment Friday.

In a subsequent meeting with reporters, Rauscher said he did not see "any single breakthrough," but "an accumulation of information which sooner or later will ripen — and in many cases this will be soon — for developing means for cancer prevention as well as treatment."

Explaining his confidence, Rauscher mentioned that of the 100 cancers that afflict man, about 15 per cent can be treated extremely well, to the point of at least five-year survivals in half the cases.

"We see a major challenge now of providing this kind of treatment to people all over the country, rather than just at four or five major clinical centers, predominantly in the Eastern United States," he said.

"This can be described, I suppose, as a breakthrough, but it is in the utilization of existing knowledge that I think we can do much better, now that we have expanded resources."

Rauscher, 40, has had long service in cancer research. With a doctorate in virology and microbiology, he has, in his words, a record of "about 10 to 13 years at the bench in the laboratory."

Since 1965, he has been involved in the management of the nation's Special Virus Cancer program.

"We are trying to apply these management techniques on a broader base to cancer," he said.

Asked to explain progress in cancer research and treatment in everyday language, Rauscher said he would "shy away from speaking about a solution" to the problem of cancer.

"There will be many solutions," he said. "In fact, there are many examples I could give you. We know what causes many cancers right now.

"Leukemia is fast becoming one of the most treatable diseases of any of our cancers."

Discussing lymphocytic leukemia in children, Rauscher said this disease occurs today in some 15,000 American children below the age of 7 every year.

He added: "Between four and five years ago, the average life expectancy of a child presented with leukemia was in the order of four to six months. Today, with aggressive chemotherapy, the use of combinations of drugs, 85 per cent of these children can be put into long-term remission.

"In fact, this is becoming so good that by life tables — the analysis we would do on any one of us if we went for a new insurance policy, as an example — by that kind of analysis, 50 per cent are living disease-free after five years. We are at the point where we are beginning to feel confidence in saying that these are cures."

Rauscher cautioned, however, that even with such progress in the treatment of the leukemias, the cancer mortality-fatality rate is increasing.

"There are many things that cause this," he said. "There is a tremendous increase in lung cancer, as an example."

Breakthrough Made In Fighting Disease

Three teams of scientists participating in the Special Virus Cancer Program of the NIH National Cancer Institute, a component of the Department of Health, Education and Welfare, have successfully reversed the normal flow of genetic activity among fundamental cell chemicals to permit reconstruction of a portion of the gene for red blood cell protein.

The scientists' findings establish a new approach to the study of genetic diseases of the blood such as thalassemia.

Normally, a cell stores the genes which control its hereditary characteristics in a cell chemical called deoxyribonucleic acid (DNA), the master chemical of life. DNA ordinarily transmits its inherited instructions to a sister chemical called ribonucleic acid (RNA). Among its activities, the RNA serves as a messenger to carry the instructions of the gene to the fluids of the cell where it directs the production of protein needed to carry on life.

In their initial experiments with rabbit cells, the scientists purified a messenger RNA which directs production of globin, the protein part of the hemoglobin of red blood cells. Later, they applied the method to experiments with human messenger RNA.

They then added a special enzyme, called reverse transcriptase, to a combination of the globin messenger RNA, plus the subunits needed to make DNA and a short nucleic acid primer to start the reaction at the proper RNA site. The scientists found that the messenger RNA directed the formation of a DNA strand complementary to itself. By chemically eliminating the RNA strand of the resulting RNA/DNA hybrid, the scientists successfully produced a single-stranded DNA.

The scientists caution, however, that the copies, while extensive, may not be complete. In addition, because of technical problems not yet overcome, the biological activity of the "gene" has not been proven.

The scientists foresee use of their method to study diseases caused by mistakes in the processing of genetic messages. For example, thalassemia, a type of anemia, is characterized by production of abnormally thin red blood cells resulting from an inadequate level of hemoglobin. By isolating messenger RNA, synthesizing radioactive DNA from it, and using that DNA to measure the messenger RNA in the thalassemic cell, scientists may be able to determine whether the disease is caused by an inadequate amount of normal messenger RNA or by the production of defective messenger RNA for globin.

Ultimately, the scientists believe that an understanding of the processing of gene instructions in the mammalian cell will provide insight into how a cell acquires a specialized function in the animal, such as its functioning as a muscle, bone, or blood cell.

The scientists on the NIH team are Drs. Jeffrey Ross and Edward Scolnick of the Viral Leukemia and Lymphoma Branch, National Cancer Institute, and Drs. Haim Aviv and Philip Leder of the National Institute of Child Health and Human Development.

Medical Center MD In Russia Two Weeks

HERSHEY — A faculty member at The Milton S. Hershey Medical Center of The Pennsylvania State University is one of seven American cancer scientists currently in the USSR on a two-week exchange of information with leading Soviet scientists.

He is Dr. Fred Rapp, a virologist who has been chairman of the department of microbiology at the Medical Center since 1969.

The exchange is part of a U.S.-U.S.S.R. health agreement to share research results from cancer, heart disease and environmental studies which was signed in Moscow in May 1972 during the President's summit meeting.

As part of the exchange agreement, the U.S. delegation will present to Soviet scientists 31 strains of cancer viruses affecting chickens, cats, rodents, and non-human primates, as well as a possible human tumor virus from a muscle cancer.

Dr. Fred Rapp

Dr. Rapp heads a research team at the Medical Center which has studied human viruses as a cause of cancer under the Special Virus Cancer Program, a research contract program under the etiology area of the National Cancer Institute, since 1970.

The U.S. team will visit cancer research institutes in Moscow, Leningrad and Sukhumi. They are expected to develop a joint plan for continued exchange of research results on cancer viruses.

In addition to Dr. Rapp, the team includes Drs. John Moloney, Timothy E. O'Connor, and Louis B. Sibal, of the National Cancer Institute, Bethesda, Md. Dr. J. Thomas August, Albert Einstein College of Medicine, New York City; Dr. Freidrich Deinhardt, Rush-Presbyterian-St. Luke's Medical Center, Chicago, and Dr. Robert M. McAllister, Children's Hospital of Los Angeles.

Researchers Aid Fight

Experiments Link Viruses With Forms Of Cancer

By Judith Randal
New York Times News Service

WASHINGTON — Two sets of experiments have added weight to the already impressive evidence that links some forms of human cancer with infection by a virus.

One set of experiments — the joint venture of a George Washington University scientist and a researcher at the University of Naples in Italy — implicates members of the same virus family in cancer of the female cervix and cancer of the lip.

The other — a collaborative effort between scientists at Columbia University College of Physicians and Surgeons in New York and the Bionetics Research Laboratories in Bethesda, Md. — indicates a different kind of virus may play an important role in causing breast cancer, which kills more than 32,000 women and from 250 to 300 men in the United States each year.

Both sets of experiments are described in the current issue of the weekly magazine Science and were supported by funds from the special virus cancer program begun by the National Cancer Institute about three years ago.

It has long been known that viruses are capable of producing a variety of malignant tumors in many species of animals and plants and virus remnants of one kind and another have been found with growing frequency in recent years in the tissues of cancer patients. The trouble is that it has been difficult to determine whether their presence was merely accidental or had played a role in the development of the disease.

Although neither set of experiments answers this question definitively, they promise to hasten its resolution. Meanwhile, they may lead both to better cancer therapies and improved detection tests so tumors can be found early when chances of successful treatment are best.

In their experiments on lip and cervical cancer, Drs. Ariel C. Hollinshead and Giulio Tarro tried to find out whether herpes simplex viruses — of the family of virus which causes cold sores — are capable of inserting some of their genes into the heriditary machinery of human cells.

After a complex series of studies the scientists were able to demonstrate that an insoluble protein characteristic of herpes simplex viruses appears in tissue samples taken from patients with cancer of the lip or cervix but not in the tissue sample of patients with several other forms of cancer or those without cancer.

Furthermore, this protein — when removed from the surface of lip and cervical tumor cells — was identical to that found on normal cells grown in the test tubes after they had been infected with herpes simplex viruses.

The protein in question is known as antigen and is thought to appear in cancer patients as a result of interactions between a chemical or chemicals on the surface of herpes viruses and cells of the lip or cervix depending on which of the two types of cancers are involved.

Scientists believe there is probably a lag of years between the time of exposure to the virus and the onset of tumor growth and that this explains why an intact virus is seldom recovered from cancer patients.

Some breast cancer in laboratory mice is common and was discovered in the 1930s to be often due to a virus which newborn animals drink as nurslings from their mothers' milk. And it has since been shown, with photographs taken with an electron microscope, that these mouse cancer viruses are identical in appearance to particles often found in samples of human milk — particularly if there is a family history of breast cancer.

The new experiment demonstrates there is a chemical relationship as well.

Young Vandals In Lab Exposed To Dangerous Virus

By M. P. FLEISCHER
Of The Times Staff

Youthful vandals smashed through the Life Sciences laboratories in St. Petersburg Wednesday night, unknowingly exposing themselves to a wide variety of disease-bearing organisms and a virus strain that induces cancer.

Evidence at the laboratories, 2900 72nd St. N, and at a nearby business vandalized Monday points to youngsters between 10 and 12 years old, Patrolman John Spasoff said.

"THEY'VE BOUGHT themselves more trouble than they bargained for with this break-in," he said.

The disease-inducing organisms, harmless under controlled laboratory conditions, are used by Life Sciences researchers in the National Cancer Institute-sponsored "special virus cancer program" and in studies of anti-virus antibiotic drugs, said Dr. Vincent Groupe, president of the firm.

Groupe said the damage, including six calculators and an electric pencil sharpener taken by the persons who broke into the laboratory, "is in the neighborhood of $20,000." The vandalism also sets back the lab's research program, he said.

"There's a real concern around here that those people might be exposed to some really virulent disease-inducing organisms," he said. "Those youngsters can get awfully sick."

GROUPE said the lab building was entered through a window. "Then they went on a spree, just smashing things," he said. He said eight lab rooms were vandalized, the library was "torn apart" and dyes used to stain cultures were spilled all over the place and stamped into carpets, chair cushions and other things.

"I'll bet these kids have purple and green shoes and multi-colored clothes," he said.

Spasoff set the time of the break-in at between 7 p.m. and midnight. The other business vandalized in the same area also was damaged during the same hours.

Congress Makes Conquest of Cancer a National Goal

(Second in a Series)

By ANNE KOVALENKO

The National Cancer Institute (NCI) — one of the 10 research institutes that are part of the National Institutes of Health — is the nation's principal federal agency on the causes, diagnosis, treatment and prevention of cancer.

In 1973 Congress appropriated more than $432 million —the largest amount ever — for a Presidential and a Congressional commitment establishing the conquest of cancer as a national goal. Last year a total of $378,794,000 was appropriated for this purpose.

The National Cancer Act of 1971 authorized $1.6 billion over the ensuing three years to advance the national effort against cancer.

Headed by Area Man

Dr. Frank J. Rauscher Jr., son of Mr. and Mrs. Frank J. Rauscher of 851 New Jersey Ave., Hellertown, was named director of the National Cancer Institute and charged with the responsibility of carrying out the expanded, intensified and coordinated cancer research program.

This graduate of Moravian College (1953) received a Ph.D. from Rutgers in 1957 and came to NCI in 1959 as a microbiologist in the Laboratory of Viral Oncology until 1964 when he was appointed head of the Viral Oncology Section.

A year later he was appointed acting chief of the Viral Leukemia and Lymphoma Branch while simultaneously serving as chairman of the Special Virus Cancer Program. Subsequently, he became chief of the Viral Leukemia and Lymphoma Branch and in 1967 was appointed associate scientific director for viral oncology. In 1969 he was named acting scientific director for etiology and in 1970 scientific director of etiology. He became head of NCI on May 5, 1972.

His Responsibilities

The National Cancer Act of 1971 authorized the director of NCI to:

1. Plan and develop an expanded, intensified and coordinated cancer research program encompassing the programs of the Institute, related programs of other research institutes and other federal and non-federal programs with the advice of the National Cancer Advisory Board.

2. To utilize existing research facilities and personnel of NIH for accelerated exploration in areas of special promise.

3. To encourage and coordinate cancer research by industrial concerns which evidence a capability for such research and,

4. To collect, analyze and disseminate all data useful in the prevention, diagnosis and treatment of cancer, including establishment of an international cancer research data bank.

Seven Main Thrusts

The announced strategy of NCI, according to Dr. Rauscher, involves seven primary thrusts: The first four —classified under Cause and Prevention — are (1) to reduce the effectiveness of external agents (such as pollution, cigarette smoking, etc) (2) to modify individuals (3) to prevent conversion of cells and (4) to prevent tumor establishment.

The fifth objective (classified under Detection and Diagnosis) is to achieve accurate assessment of cancer risks. The sixth is to cure as many patients as possible and the seventh, to restore patients as fully as possible.

Supportive surgery is performed to sustain the patient or to alleviate pain or discomfort resulting from cancer while preventive surgery may be performed to prevent development of the disease. For instance, certain polyps, and moles of the colon, rectum, skin or larynx may be precancerous conditions which might become so if left untreated.

Radiotherapy has become increasingly important in the United States in the past two decades. Radiation may reduce the size and delay the spread of cancers, heal ulcerating tumors, diminish or stop persistent bleeding or hemorrhage and relieve tumor-related obstructions of the blood vessels.

To cure cancer a radiation dose must be large enough to destroy cancer cells but not so great as to seriously damage normal tissue surrounding or overlying the cancer.

Localized cancer often can be removed by surgery or destroyed by radiation but these methods can rarely cure cancers that have spread nor can they cure cancers of the blood or blood-forming tissues such as leukemia.

345,000 Deaths a Year

Most of the 345,000 cancer deaths in the United States yearly are due to the inability of surgery or radiation to cure widespread disease.

Scientists have felt for years that the best way to treat such cancers would be drugs or chemicals that would destroy cancer cells and yet not harm normal tissue.

More than 40 drugs have already been developed that are useful in treating some form of cancer. In about 15 per cent of clinical cancer, the drugs can produce cures. In many of the rest, they often temporarily inhibit the cancerous growth, relieve pain and allow the patient to live a longer, more comfortable life.

Cancer can strike at any age. It affects children as well as adults but it strikes with increasing frequency with advancing age.

About 53 million Americans now living will eventually have cancer — about one in four according to present rates. Cancer will strike in about two of three families.

In the 70's there will be an estimated 3.5 million cancer deaths, 6.5 million new cancer cases and more than 10 million under medical care for cancer.

Early detection is emphasized in all cancers. Physicians advise that if you recognize a symptom, go to your doctor to find out if it means cancer. Don't wait for symptoms to become painful. Pain is not an early sign.

The possible signs of cancer?

NCI lists seven: Unusual bleeding or discharge; a lump or thickening in the breast or elsewhere; a sore that won't heal; change in bowel or bladder habits; hoarseness or cough; indigestion or difficulty in swallowing or change in a wart or mole.

Where are they today?

Research is organized into three broad areas — etiology, chemotherapy and general laboratories and clinics.

Etiology is concerned with cancer causation and prevention. Top priority in this area is carcinogenesis — the induction of cancer by environmental agents such as viruses, chemicals or radiation acting either alone or in combination.

Human Cancer Virus?

Virus-cancer research holds great promise, according to Dr. Rauscher. Recent discoveries by research teams have turned up what may be a human cancer virus in the skeletal muscles of a seven-year-old child, a monkey and an ape.

Efforts are under way to determine whether these viruses are of human origin, whether they occur primarily in human cells and whether they can cause cancer in animals.

Rauscher emphasizes that few cancers develop because of heredity — that most are caused by what people do or are exposed to over a number of years.

Cancer is a disease that may be preventable if it is largely induced by chemicals or conditions in the environment. Scientists are therefore trying to identify and eliminate carcinogens (cancer-causing agents) wherever possible.

Environmental pollution caused concern as long ago as 1775 when cancer of the scrotum in chimney sweeps of London was believed related to their long exposure to soot. Historically, research tried to establish there was an increased risk of cancer in certain industrial settings. At present, occupationally related cancers have been linked to substances like coal tar and other combustion and distillation products of coal, oil shale, lignite and petroleum as well as metal and radioactive ores and compounds of metals such as asbestos.

Smoking Related to Cancer

The most significant findings in chemical carcinogenesis is the relationship of cigarette smoking with lung cancer and the association of smoking with other types of cancer. This discovery resulted in the passage of a bill by Congress calling for strict regulation of cigarette advertising with a ban on television promotion and the printing of a warning on all cigarette packages.

The sixth objective in cancer research — to cure as many patients as possible — receives about 35 per cent of all allocated funds.

Surgery, radiation and chemotherapy are the primary methods of arresting and controlling most forms of cancer today.

Surgery may be specific, supportive or preventive. It is the primary form of treatment for cancer of the lung —the form that claims the most lives in the United States.

When surgery is performed for early forms of these cancers, 70 to 80 per cent of the patients live five years and many are cured.

Cancer of the breast also is treated primarily by surgery. Stomach cancer at present can be treated successfully only by surgery.

20 Years Research Reveal

Body Defect Can Trigger Cancer

A trail of research spanning nearly two decades has led to the discovery of a new link between cancer and the body's immune system.

Patients with a rare intestinal disease have been found to have a unique type of defect in their immune defense systems. The same patients have also been found to have an increased likelihood of developing cancer.

The immune defect is associated with a disease called intestinal lymphangiectasia, first described by physicians at the National Institutes of Health Clinical Center.

This disease is one of the protein-losing "gastro-enteropathies," a new class of diseases identified on the basis of studies started at the Clinical Center soon after it opened in 1953.

In patients with intestinal lymphangiectasia, the channels of the lymph system do not develop properly, particularly in the walls of the small intestine. The channels are larger than normal and allow the body fluid called lymph to leak into the small intestine and thus pass out of the body. This leakage of lymph causes a steady loss of white blood cells and dissolved proteins.

Dr. Thomas A. Waldmann and co-workers at the National Cancer Institute (NCI) have found that patients with intestinal lymphangiectasia have a markedly depressed capability to carry out immune defense reactions. This is caused chiefly by shortages of lymphocytes.

NCI scientists discovered that lymphocytes in these patients are lost through their defective lymph vessels. In addition, remaining lymphocytes have an impaired immune capability.

Cancer develops more frequently than normal in persons with various immune disorders and in transplant recipients who are given immunosuppressants to prevent rejection of donated organs.

Cancer has also been found in an above-normal number of intestinal lymphangiectasia patients at the Clinical Center. This adds to the growing body of evidence on the importance of the immune system as a defense against cancer.

The loss of lymphocytes into the intestine represents another means by which the immune system can become defective. A number of other immune disorders have been identified by investigators at the Clinical Center and elsewhere.

These disorders include decreased production of white blood cells and antibodies (proteins in the blood which neutralize bacteria and other harmful substances), destruction of antibodies by abnormal metabolic reactions, and defects in recognizing and attacking body invaders.

The growing understanding of intestinal lymphangiectasia emerged from nearly 20 years of work at the NIH Clinical Center. Scientists at several NIH Institutes studied patients with extremely low levels of protein in their blood.

Over a period of years, Dr. Jesse L. Steinfeld (later surgeon-general of the Public Health Service, who spoke at Moravian College about a year ago) Dr. Robert Gordon of the National Institute of Arthritis, Metabolism and Digestive Diseases; Dr. Frederick Bartter of the National Heart and Lung Institute; Dr. Warren Strober of the National Cancer Institute and other NIH scientists identified a new class of diseases — the protein-losing gastro-enteropathies in which proteins from the blood were lost into the gastro-intestinal tract. As understanding of the disorder progressed, several new diseases were discovered including intestinal lymphangiectasia. More than 90 diseases are associated with protein-losing gastro-enteropathy.

Med Center Provost To Visit Mainland China

HERSHEY — Dr. Fred Rapp, associate provost for health affairs and professor and chairman of microbiology at The Milton S. Hershey Medical Center of The Pennsylvania State University, is one of eleven Penn State scientists and educators who will visit the People's Republic of China in February.

The delegation, led by Dr. John W. Oswald, University president, will enter China at Hong Kong on February 8 and will depart from the same point February 28.

The trip is supported by a grant from the Ford Foundation. The itinerary includes stops at Canton, Shanghai, Soochow, Wuhsi, Nanking and Peking with side trips to other sites. Members of the group plan to consult with Chinese officials in many specialized areas and to visit major universities, research centers, collective farms, and industrial plants.

At Canton, the group hopes to visit Lingnan University where the "Penn State in China" program was headquartered for nearly fifty years.

Other university professors in the delegation represent the areas of political science, agricultural economics, speech, economics, geography, and Chinese history.

Dr. Rapp also has visited the U.S.S.R. as one of seven American cancer scientists participating in a continuous exchange of information under the U.S.-U.S.S.R. health agreement to share research results signed in Moscow in 1972 during President Nixon's summit meeting there. Dr. Rapp heads the research team at the Medical Center which is studying human viruses as a cause of cancer under the special virus cancer program of the National Cancer Institute.

Scientists Criticize Managers

Cancer Institute Shifting Virus Study

New York Times News Service

BETHESDA, Md. — The National Cancer Institute is undertaking a major reorganization of its special virus cancer program in response to criticism from scientists.

The 10-year-old program is dedicated to exploring the possible role of viruses in causing human cancers, one of the most intensively pursued areas of modern cancer research.

The program is one of the institute's major research efforts and costs more than one-tenth of the total annual budget of the institute, which is the federal agency conducting the government's research fight against cancer.

Administration of the special virus program was criticized sharply earlier this year by a committee of scientists appointed by the National Cancer Advisory Board. The virus-cancer program supports research and the production of materials needed in research through contracts with organizations and individuals outside the cancer institute. It was the management of that program, including instances of apparent conflict of interest, that was the primary target of criticism.

Dissatisfaction came to a focus in March when a review committee appointed by the advisory board delivered a sharply critical report.

The committee report said the prtgram was limited too much to a narrow section of the scientific community and that conflicts of interest had arisen because scientists of the institute who were passing judgment on contract proposals often had close ties to organizations seeking the contracts.

"Those who run it are also often the recipients of large amounts of money they dispense," said the report.

In the early days of the program, this was almost inescapable because there were few scientists working in cancer-virus research.

The report, prepared under the chairmanship of Dr. Norton Zinder of Rockefeller University, said the vision that established the program had been sound, but that the management philosophy had been "sadly in error."

"Instead of allowing the direction of the scientific program to come from working scientists by opening it to all, the program appears to have been a closed operation from its start," the report said.

At its spring meeting here this week, the advisory board was told of the institute's reorganization plans, some of which began before the report was presented earlier this year. The advisory board oversees the programs of the institute.

Dr. Harold Amos, of Harvard Medical School, said the program had in fact been highly productive and scientifically excellent. Nevertheless, Amos expressed general agreement with the recommendations for change.

Dr. John B. Moloney, head of the virus-cancer program, said that, among other changes, roughly five program-review working groups of scientists were to be replaced by two new review groups. In these, scientists from outside the institute will be heavily represented and the working rules will be such as to prevent conflict of interest.

The virus-cancer program spends about $46 million a year, in contrast to about $23 million that goes directly to grants for scientists working on virus research, but outside the special program.

Hershey Med Center Opens New Cancer Research Wing

HERSHEY — The first facility in central Pennsylvania with the primary mission of cancer research will open officially today at 4:30 p.m., with ribbon cutting ceremonies at The Milton S. Hershey Medical Center of The Pennsylvania State University.

Program participants will be Michael Baker Jr., president of the Penn State Board of Trustees; Dr. John W. Oswald, president of the University; Dr. Guy R. Newell Jr., deputy director of the National Cancer Institute of the National Institutes of Health; and Dr. Fred Rapp, associate provost and dean for health affairs and professor and chairman of microbiology at Hershey. Dr. Harry Prystowsky, provost of the Medical Center and dean of the college of medicine at Hershey, will serve as master of ceremonies.

Dr. Rapp said the new building will "permit a tremendous expansion of the already important role of Penn State'sCollegeof Medicine as a national and international training and research center with the ultimate goal of improved patient care and better human health." He said that some 100 persons currently working in the field of cancer at Hershey will move into the building throughout the winter. It is projected that an eventual staff of some 200 research scientists and technicians plus graduate students and medical students will participate in the programs.

The $3.6 million basic sciences-cancer research wing was made possible through a $2 million construction contract from the National Cancer Institute cancer etiology program under the federal Conquest of Cancer Act of 1972. They were awarded to Penn State as an extension of a research contract existing between the NCI special virus cancer program and Dr. Rapp's laboratory since 1970 for the study of defective human viruses.

The University committed $1.2 million in non-state funds previously ear-marked for expansion of the Medical Center. Additional funds have been provided by the federal government and other sources toward laboratory benches and fixed equipment.

The wing is the first addition to the main building on the Hershey campus which houses the medical sciences building and hospital. Located at the western end of the basic sciences wing, it is the fourth extension south from the crescent shaped front of the structure as it is seen from Route 322. There are approximately 36,000 square feet of new laboratory space in the wing's eight floors.

Cancer research at the Medical Center currently is being funded by 20 research and training grants and contracts from the National Cancer Institute and two each from the American Cancer Society and the Leukemia Society of America.

Primary areas of research to be conducted initially in the wing will focus on the role of viruses in causing cancer, with particular emphasis on long-range possibilities for methods of early diagnosis and prevention of metastases, the biology of cancer cells, with stress on how they differ biochemically and genetically from normal cells; and methods for controlling the multiplication of cancer cells. Body areas included are the cervix, uterus, breast, prostrate, bladder, lung, blood system and skin.

Cooperative programs are being conducted with the University of Chicago Medical School, Rush-Presbyterian Medical School in Chicago, Roswell Park Memorial Cancer Institute in Buffalo, Children's Hospital of Philadelphia, and the University of Texas. These programs provide for the exchange of information, biological reagents and materials, expertise in specific areas of knowledge and techniques. They have resulted in a number of new findings published jointly in international professional journals.

The Penn State College of Medicine faculty over the past five years has trained numerous visiting scientists from other continents who

The Hershey Star

RIBBON IS CUT . . . and operations formally begin at $3 million basic sciences-cancer research wing at Milton S. Hershey Medical Center. Participants in dedication ceremony Wednesday, October 30, were, l-r: Dr. Harry Prystowsky, provost of Medical Center and dean of college of medicine at Hershey; Dr. Guy R. Newell, Jr., deputy director of National Cancer Institute of National Institutes of Health; Dr. John W. Oswald, president of University; Dr. Fred Rapp, associate provost and dean for health affairs and professor and chairman of microbiology at Hershey; and Michael Baker, Jr., president of the Penn State board of trustees.

Cancer Research Wing Opens At Hershey Medical Center

The first facility in central Pennsylvania with the primary mission of cancer research opened officially Wednesday, October 30, at 4:30 p.m., with ribbon-cutting ceremonies at The Milton S. Hershey Medical Center of The Pennsylvania State University.

Program participants were Michael Baker, Jr., president of the Penn State Board of Trustees; Dr. John W. Oswald, president of the University; Dr. Guy R. Newell, Jr., deputy director of the National Cancer Institute of the National Institutes of Health, and Dr. Fred Rapp, associate provost and dean for health affairs and professor and chairman of microbiology at Hershey. Dr. Harry Prystowsky, provost of the Medical Center and dean of the college of medicine at Hershey served as master of ceremonies.

A significant address was made by Dr. Newell of the National Cancer Institute. He stated that he felt honored to participate in the dedicaion ceremonies and was impressed by his expansion of a "young, vibrant and critically needed medical center." He pointed out that "the Milton S. Hershey Medical Center, in barely more than a decade, has already demonstrated to the people of Pennsylvania and to our nation its ability to function magnificently in the art of medicine and in contributing to the National Cancer Program." In mentioning the funding of the addition, Dr. Newell stated, "I would like to pay tribute to those who provided the remaining one-third of the funds." The National Cancer Institute supported two-thirds of the funding. Because the funds were available approximately 25,000 square feet of additional laboratory space for studies in fundamental cancer research by basic science and clinical faculty members is now ready to be put into operation. Dr. Newell stated enthusiastically, "The Milton S. Hershey Medical Center will have expanded facilities to train young scientists, to give medical students exposure to developments in cancer research, and to support over $1.5 million of cancer research contracts and grants." Dr. Newell explained that the major emphasis of research in the new laboratories will be the study of viruses that may cause cancer in humans. "Among the viruses under study here are defective human viruses — viruses that cannot produce the usual effects of infection."

He pointed out that these areas have been investigated for many years, and the studies will be able to be expanded upon in this new research facility. Dr. Newell stated, "I have every confidence — and I say this with the full endorsement of the director and the senior scientific staff of the National Cancer Institute — that the invesment we are making today in this splendid edifice will, under the guidance of this team of gifted scientists, pay off handsomely." Dr. Newell is optimistic about the potential of an institution such as he Medical Center He stated that "in the 1930's fewer than one in five cancer patients was being saved; in the 1950's, that ratio was reduced to one in four. Today, it is one in three, and this could be immediately reduced to one in two if every single person heeded the oft-repeated warnings about cancer prevention and frequent medical check-ups. With heartening regularity there have been emerging from research laboratories and clinics such as this one scientific findings that bring us a step — perhaps just a small step — closer to the solution of the cancer problem. The solution will not come from a dramatic, one-time breakthrough, but rather from deliberate efforts of young, innovative scientists such as those in this institution."

Dr. Newell related that new discoveries are being made about the substances in our environment that could relate to cancer. He pointed out that once identified, these substances are being removed from contact with humans. As a specific example he mentioned the intensive efforts to produce a less hazardous cigarette. He spoke enthusiastically about proven methods of diagnosis and detection — the Pap smear, mammography, and Xerography. Dr. Newell pointed out that although scientists have known for years that some viruses cause some forms of cancer in certain animals, they have not yet shown this to be true in humans. In a reassuring manner Dr. Newell added, "We are sanguine in our belief that the role of viruses in human cancer causation will be determined in the next very few years. This will herald yet another whole new era of cancer prevention, diagnosis and treatment." In conclusion Dr. Newell said, "It is my hope, and, I am sure, the hope of everyone here, that what we germinate in this building will come to fruition in an answer to at least one of the major riddles of cancer — and in answering that riddle will herald a new generation of opportunity for cancer research and contra. All who are connected with this center should be proud on this day. I know I am proud to be even a marginal part of it."

Not only Dr. Newell, but all of the program parucipants, spoke enthusiastically about the potential for the new research institution. Dr. Rapp stated that the new building will "permit a tremendous expansion of the already important role of Penn State's College of Medicine as a national and international training and research center with the ultimate goal of improved patient care and better human health." He said that some 100 people currently working in the field of cancer at Hershey will move into the building throughout the winter. It is projected that an eventual staff of some 200 research scientists and technicians plus graduate students and medical students will participate in the programs.

The $3.6 million basic sciences-cancer research wing was made possible through a $2 million construction contract from the National Cancer Institute cancer etiology program under the federal Conquest of Cancer Act of 1972. They were awarded to Penn State as an extension of a research contract existing between the NCI special virus cancer program and Dr. Rapp's laboratory since 1970 for the study of defective human viruses.

The university committed $1.2 million in non-state funds previously earmarked for expansion of the Medical Center. Additional funds have been provided by the federal government and other sources toward laboratory benches and fixed equipment.

The wing is the first addition to the main building on the Hershey campus which houses the medical sciences building and hospital. Located at the western end of the basic sciences wing, it is the fourth extension south from the crescent-shaped front of the structure as it is seen from Route 322.

Cancer research at the Medical Center currently is being funded by 20 research and training grants and contracts from the National Cancer Institute and two each from the American Cancer Society and the Lukemia Society of America.

Primary areas of research to be conducted initially in the wing will focus on the role of viruses causing cancer, with particular emphasis on long-range possibilities for methods of early diagnosis and prevention of metastases, and biology of cancer cells, with stress on how they differ biochemically and genetically from normal cells; and methods for controlling the multiplication of cancer cells. Body areas included are the cervix, uterus, breast, prostate, bladder, lung, blood system and skin.

Cooperative programs are being conducted with the University of Chicago Medical School, Rush - Presbyterian Medical School in Chicago, Rosewell Park Memorial Cancer Institute in Buffalo, Children's Hospital of Philadelphia, and the University of Texas. These programs provide for the exchange of information, biological reagents and materials, expertise in specific areas of knowledge and techniques. They have resulted in a number of new findings published jointly in international professional journals.

The Penn State College of Medicine faculty over the past five years has trained numerous visiting scientists from other continents who have spent extended periods of time as visiting scholars. The new building will permit expanded opportunities for international scientists to work at Hershey, and visiting fellows from other American research centers are already scheduled for stays of from six months to two years.

The building will house personnel for the departments of anatomy, biological chemistry, microbiology, pathology, pharmacology, physiology, comparative medicine and support services.

It is the expectation of all connected with this addition to the Medical Center that new doors will be opened in the areas of cancer research and related fields. Directors of the cancer research program feel that they have every reason to be confident in the new cancer wing as the Medical Center is staffed with some of the "most brilliant scientists in the nation."

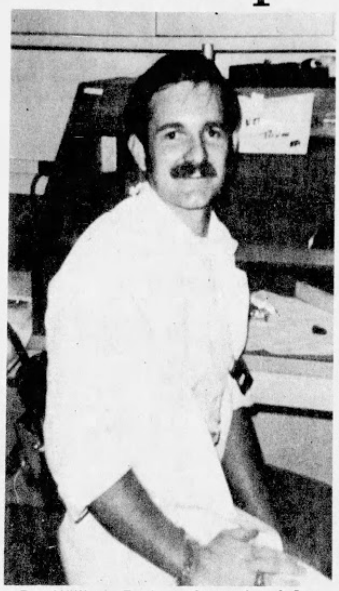
Viruses could be cause of disease in breasts

Former port grad close to cancer breakthrough



Dr. William Drohan, formerly of San Pedro, is working on a possible breakthrough in breast cancer research. He is investigating the possibility that viruses cause human breast cancer and is trying to isolate the virus.

By Bobbie Ellis
Staff writer

A microbiologist, who was graduated in 1964 from Fermin Lasuen High School in San Pedro, is working on a possible breakthrough in breast cancer research.

Dr. William Nash Drohan, 28, the son of Mr. and Mrs. Robert P. (Christine) Drohan, 1424 N. Cabrillo Ave., San Pedro, is investigating the possibility that viruses cause human breast cancer.

Although a human breast cancer virus has yet to be isolated, Drohan is using a virus isolated from a natural-occuring mammary tumor of a female Rhesus monkey as a means to study the human disease.

Using the monkey virus as a probe, the former Holy Trinity Elementary School student has identified what appear to be fragments of a human breast cancer virus in tissues from women with malignant breast cancer.

No similar various pieces have been found in normal human tissue, according to the Department of Health, Education and Welfare (hew).

Working in a Springfield, Va. Laboratory supported by the Special Virus Cancer program of the National Cancer Institute, Drohan has not put cells from the malignant breast tissue into laboratory culture tubes, where he is artifically growing them in an attempt to induce a cancer virus.

If this line of research proves successful, the former San Pedran hopes to raise a vaccine that, when innocluated into female infants, would prevent viral related breast cancer in adulthood.

According to the Public Health Service's National Institues of Health in Bethesda, Md., if the becomes impossible for Drohan to isolate the cancer virus from the human cells, he will try to purify the viral fragments he already has identified.

These fragments, then, will be employed as tools to generate diagnostic tests for the early detection of breast cancer.

The prognosis for patients with breast cancer which is detected and treated early is quite good. The outlook becomes even better as surgical and chemotherapeutic treatment improves.

Drohan's research is supported by a contact within the Special Virus Cancer program. He also has received support from the American Cancer Society.

Born in Boston, Mass., Drohan grew up in San Pedro.

He received his bachelor of arts degree in medical microbiology in 1968 from the University of California at Los Angeles, after which he was accepted at the UCLA pre-doctoral laboratories.

In 1970, he was awarded a U.S. Public Health Service grant of $22,500 for research into the virus AMV (Avian Myoblastosis) known to cause acute lymphatic leukemia in chickens.

The grant enabled him to investigate AMV's effect on chicken neucleic acid, the herditary material, and apply the results to humans.

Drohan's superior at the time was Dr. Marcel Baluda, a Nobel prize winner for work in cancer research.

Drohan received his doctorate from UCLA in 1973.

He and his wife, Marian, make their home in Annandale, Va.

Money Pours In But Cancer War Drags

The Pittsburgh Press
IN THIS SECTION
Editorials, Finance, Sports, Want Ads, Comics, TV
Page 13 Tuesday, March 9, 1976

(This is the third in a series excerpted from 'The Patchwork Mouse,' the just-published book on cancer research by veteran science reporter Joseph Hixson.)

By JOSEPH HIXSON

The American public suffers from time to time with a preoccupation over a single disease and today that disease is cancer.

For reasons that are obscure, cancer had almost the taboo status of a venereal disease all through the 19th century and well into the 20th. Outlays by the U.S. Hygienic Laboratory, predecessor of the Public Health Service, when it started supporting a special cancer laboratory at Harvard in 1922, totaled $11,000.

By March, 1975, the total appropriated by Congress for cancer research had reached $691 million.

Among those opposing such huge outlays for cancer research were formidable men like Dr. James Ewing, then director of New York's Memorial Sloan-Kettering Hospital.

A solution for cancer, he argued when Congress was debating establishment of a National Cancer Institute in 1937, 'will come when science is ready for it and cannot be hastened by pouring sums of money into the effort.'

Those are not the sort of words today's American Cancer Society likes to hear. The society orchestrates its campaign for funds carefully but with little regard for consistency.

While it keeps an up-to-date list of celebrities who have died of the disease, it also encourages articles by or about people who have survived cancer's onslaught and publicizes the celebrities among them, such as Shirley Temple Black, Betty Ford and Happy Rockefeller.

The American Cancer Society's slogan "Early Detection Means Longer Life," pinpoints one of the many ambiguities inherent in making the public aware of cancer. It can easily be self-fulfilling and hence misleading.

Since a tumor in its earliest phase, when it is a single aberrant cell or perhaps two or four cells, is undetectable by any medical tests known today, doctors cannot know the moment when a person develops cancer.

What had in 1964 looked like a simple hunt for cancer-causing viruses against which medicine might produce vaccines, turned out to be a far more complex matter.

Therefore, two people could become cancer victims on the same day, but the tumor of one of them might be diagnosed as cancer a year before that of the other.

If subsequently both died on the same day, the patient with the earlier detection would obviously think he or she had lived a year longer with cancer. So would the physicians.

And there is the matter of defining a cancer cure.

Medicine generally, and the cancer society in particular, have defined a cured cancer patient as one who survives five years after cancer has been diagnosed. This definition, of course, makes it possible for a cancer victim dying in his sixth year of the disease to be labeled as cured.

Finally, there is the problem of the location of the tumor. Cancer does not directly kill its victims. A patient with a brain tumor frequently dies of the pressure generated by the growing mass of cells in the skull.

Cancer patients with small and slowly growing tumors frequently succumb to neglect while being carefully cared for in bed.

Insufficient exercise can give rise to blood clots in the legs that, traveling through the veins and arteries, eventually are trapped in a lung vessel that is too small to let them pass. The patient then dies of a pulmonary embolism.

Since the fatality is classifiable as a cardiovascular death resulting from cancer, it is at least arguable whether those stumping for more cancer money — from the point of view of the American Heart Association at the expense of the National Heart and Lung Institute — should be allowed to claim such patients as cancer deaths to prove their case.

Likewise, patients with leukemia usually succumb to an overwhelming infection or hemorrhage. Their demise could thus be linked to diseases in the domain of either the National Institute for Allergy and Infectious Disease or the heart-lung area.

Such niceties, however, are not normally of great concern to politicians looking for a stone of disease on which to inscribe their names as a testimonial for the next election.

The House of Representatives, for example, in 1970 passed a resolution urging an all-out war on cancer.

Such Senate names as Edward M. Kennedy have long championed the war.

President Richard Nixon added another $100 million for cancer research in 1971.

And on top of the extra money, Mr. Nixon spelled out the goal in his State of the Union address in a sentence that not even the American Cancer Society writers could have improved upon:

"The time has come when the same kind of concentrated effort that split the atom and took man to the moon should be turned toward conquering this dread disease."

Heaven knows, there was more cancer hardware already in U.S. hospitals than could be used on a daily, economic basis. But in 1944 and 1961, science knew much, much more about the atomic nucleus and rocketry than doctors even now know about cancer.

In November, 1971, the Cancer Act was voted and the President signed it on Dec. 23. The bill authorized expenditures of $1.59 billion for cancer research over the next three years.

It also set up a National Cancer Advisory Board and established a three-man panel that would keep the President informed of progress and administrative problems in the program that might need his attention.

The idea of a war against cancer, with attendant connotations of defense industries and the comparisons with the space program, where contracting had been so successfully used, lured the cancer institute into a scandalous situation.

The notion of quick success paved the way for expansion of the special cancer virus program.

A handful of National Cancer Institute administrators were contracting for more than $40 million worth of viruses, epidemiology studies and animal tumor systems. It was an uneasy situation and rife with opportunities for conflict of interest.

But while the virus-program contractors were enjoying their windfalls, the scientific aspect of viral cancer causation was growing in complexity. No longer did it seem likely that a single virus infecting a human being could directly produce a cancer.

What had in 1964 looked like a simple hunt for viruses against which medicine might produce vaccines, turned out to be a far more complex matter with at least three different theories competing for validation and the whole picture growing murkier by the day.

The National Cancer Advisory Board was aware of the dissatisfactions voiced by virologists at the seeming exclusivity of the National Cancer Institute's program in their field.

Early in 1973 the board suggested a committee of 10 scientists look into the project. It promptly became known by the name of its distinguished chairman, Norton Zinder, microbial genetics professor at Rockefeller University.

When the Zinder Committee's report was made public in March, 1974, it became apparent how far highly reputed scientists could deviate from accepted standards of integrity when tempted to bolster their theorems and prejudices with huge sums of the public's money.

Although the 39-page report cited several justifications for the value to cancer research of a special effort on tumor viruses, the committee had also sought to learn from the National Institutes of Health how much money it was spending on all virus research and how much on virus research related to cancer.

It found that in fiscal 1972, the nation's health research center had made about 2,000 grants with peer review that came to about $120 million of which "about $58 million went to studies in some way related to cancer."

Of these, the center had awarded 100 grants in the area of virus research amounting to $7 million while the special virus cancer program (SVCP) had spent six times as much on 131 contracts.

The report made it plain at the outset that the committee took a dim view of such concentration of cancer virus money in so few hands.

Toward the end of its report, the Zinder Committee commented, "The vision that established the program was sound, but the underlying philosophy that the role of management of fundamental science is the same as the role of management for engineering or development when the fundamental knowledge is available, was sadly in error."

When Director Frank Rauscher of the National Cancer Institute was asked about the possible development of a cancer virus vaccine for humans, he replied, "My position has always been that vaccines are something we must strive for. Vaccines are probable.

"But to anybody in science it's understood that it's one thing to develop the capability of making a vaccine but then you have to prove that it's safe . . . I've never felt we were going to get a proven, effective vaccine in less than 10 years."

As for microbiologist Zinder, he doesn't think there's ever going to be a cancer vaccine

TOMORROW: Murmurs of betrayal.

'The Patchwork Mouse'

Meet Mary Tyler Moore

By JERRY PARKER

Mary Tyler Moore initially invaded the national consciousness in the early 1960s as the TV wife of Dick Van Dyke on the "Dick Van Dyke Show."

In five years, she collected five Emmy nominations and two Emmy awards.

On her own six-year-old CBS series, she has gone on to greater glory, several million dollars and a firmer grip on the title of America's sweetheart.

Mary Richards, the Minneapolis TV newswoman she plays, is the first situation comedy heroine to be beautiful, bright, funny, single and frankly over-30.

Miss Moore herself is 38 and has a 19-year-old son from her first marriage. For the past 12 years she has been married to Grant Tinker, head of MTM Productions.

The company produces "The Mary Tyler Moore Show," its two hit spin-offs, "Rhoda" and "Phyllis," and two other prime-time series.

The Tinker marriage spanned the dark days of Miss Moore's career, the time in the late 1960s when she starred in several movie failures and was involved in one Broadway disaster.

(Her recent TV special, "Mary's Incredible Dream," was panned by the critics and will probably have to be added to the list of career disappointments.)

Two years ago, the Tinkers hit a marital snag but they are now reconciled.

Mary Tyler Moore granted this interview in her trailer-dressing room in Studio City, Calif.

Q.—One writer said Mary Richards may be the best-liked TV character in America. Why is she so appealing?

MISS MOORE—That's a tough question. It's almost like saying "Why do you think your friends like you, Mary?" because the character of Mary Richards and the character of Mary Tinker are very similar.

It's hard for me to be objective about it. Her vulnerability is a very appealing quality, and the fact that she has enough confidence to at times assert herself.

Q.—How do the two Marys differ?

MISS MOORE: We are pretty much the same person. I think our values are similar. Our self-imposed goals and standards of perfection are similar. Mary Richards expects a lot of herself and I know I do.

Of course, our living circumstances are quite different. I am very happy to be married and to share my life and Mary Richards has no conception of what that can be and is not searching for it.

Mary Tyler Moore: 'I never thought of myself as pretty.'

Q.—You're America's best-known "bachelor girl," yet you yourself have never been in that situation, have you?

MISS MOORE—No. I have always been with somebody. I married my first husband three months after graduating from high school and there was a very short separation and divorce period between that marriage and my marriage to Grant.

Q.—Could you function well as a single?

MISS MOORE—If I had to. If, God forbid, something happened to Grant, I would have to live alone and learn to adjust. And that would be difficult.

Q.—Is this season the end of Mary Richards?

MISS MOORE—No, there are two more seasons—this one, one more and then we'll quit.

Q.—Why is that?

MISS MOORE—The show has been

Q.—Couldn't you have a broader range in movies?

MISS MOORE—Not in the field of comedy. I see very few really funny movies and I see an awful lot of really funny television. I'm quite happy with the medium of television.

Q.—Are you sensitive on the subject of age?

MISS MOORE—I have very little choice in the matter, since I have a 19-year-old son. I was born in 1937.

Q.—Were you always pretty?

MISS MOORE—Am I?

Q.—Don't you know?

MISS MOORE—I am not being coy but I have never thought of myself as being pretty, from the day I first looked into a mirror to this very moment.

Q.—Didn't other people tell you?

MISS MOORE—People tell me a lot of things and I tend not to believe them. I'm one of those people who believes only the bad reviews, never the good reviews.

Q.—I think your public pictures you as having been a cheerleader-homecoming queen type in high school. Were you?

MISS MOORE—I was none of those things. I was an ambitious kid who really wanted to be a dancer. I had friends, but they always came second. So I was something of a loner.

Q.—After years of telling reporters "I don't discuss my personal life," you gave the Ladies Home journal an interview in which you and your husband talked quite openly about your separation and reconciliation. Why was that?

MISS MOORE—We felt almost missionary-like about that particular article, and it is not something I would want to do again, nor would Grant.

University Labs offers variety of services

HIGHLAND PARK — University Laboratories, Inc., 810 North Second Avenue, is a biological research, testing and consulting laboratory. Founded in 1959 by Dr. Eugene H. Bernstein, it had its modest beginning in the basement of a frame building on Carroll Place, New Brunswick.

In 1962, University Laboratories was awarded its first contract by the National Cancer Institute, National Institutes of Health, to investigate and produce avian and mammalian tumor and leukemia viruses. Moving into a modern new building designed specifically for certain types of research, Bernstein was joined by Frederick A. Frant, who now is vice president, and two other virologists.

The business was incorporated in 1964, and was awarded a National Cancer Institute contract which tripled the original. University Laboratories expanded its staff by 12 more scientists and technicians.

The year 1965 saw an expansion of facilities at its present site. An additional 7,500 square feet, which enlarged the building four-fold, was constructed.

When the Soviet-American scientific exchange program was announced in 1972, the Special Virus Cancer Program selected University Laboratories to prepare 32 cancer viruses as part of the United States gift to the Soviet Union. A U.S. scientific team which accompanied President Nixon to the U.S.S.R. presented this package to their Russian counterparts.

University Laboratories will shortly enter its 15th consecutive year under contract to the National Cancer Institute. This is a fact very few contractors can boast of, and attests to the high quality of work accomplished under the Special Virus Cancer Program. During these years, University Labs has produced many different strains of cancer and leukemia viruses and antisera to these viruses, and is one of the few laboratories in the country capable of doing this type of production successfully.

The personnel employed to work in the virus areas are carefully screened to establish that they are completely familiar with concepts of sterility and safety procedures.

Although virology is its major field of endeavor, University Labs provides many services for the pharmaceutical, chemical, cosmetic and food industries. These services include evaluation of agents for bactericidal, fungicidal and virucidal activity; tests for nutrition, physiology and vitamin evaluation; and a wide variety of toxicity testing of drugs, cosmetics and chemicals. In addition, the laboratories are involved in carcinogenesis testing in animals, mutagenesis testing using bacteria and yeast and teratogenic studies. The mutagenesis program, in particular, is expanding very rapidly. It is a relatively inexpensive screen for the capacity of a chemical to cause mutations in microorganisms. Since most mutagenic compounds have been demonstrated to be carcinogenic, the potential hazard of a chemical may be predicted quickly and inexpensively.

The firm is involved in food microbiology and is the national testing laboratory for the largest doughnut manufacturer in the United States.

While University Laboratories performs studies involving the common laboratory animals such as mice, rabbits, guinea pigs, etc., it is also concerned with the raising of the common house fly (Musca domestica). These flies are raised through the various life cycle phases under exacting temperature, humidity and nutritional environment so that each generation is exactly as the previous. The flies are used for insecticide testing and are housed in special screened cages in a room appropriately dubbed the "Fly Room." When one considers that should all the progeny of the original two flies survive, at the end of only 6 months, there would be enough flies to cover the entire surface of the globe 47 feet deep, we can all be relieved that University Labs is in the insecticide battle! It is difficult to imagine how many flies there would be should all have survived since University Labs started raising them in 1965.

Andrew Jeremy Wakefield (born 1957) is a British former physician and academic who was struck off the medical register due to his involvement in the *Lancet* MMR autism fraud, a 1998 study that falsely claimed a link between the measles, mumps, and rubella (MMR) vaccine and autism. He has subsequently become known for anti-vaccination activism. Publicity around the 1998 study caused a sharp decline in vaccination uptake, leading to a number of outbreaks of measles around the world. He was a surgeon on the liver transplant programme at the Royal Free Hospital in London and became senior lecturer and honorary consultant in experimental gastroenterology at the Royal Free and University College School of Medicine. He resigned from his positions there in 2001, "by mutual agreement", then moved to the United States. In 2004, Wakefield began working at the Thoughtful House research center in Austin, Texas, serving as Executive Director there until February 2010, when he resigned in the wake of findings against him by the British General Medical Council.

Wakefield published his 1998 paper on autism in the prestigious medical journal *The Lancet*, claiming a novel form of enterocolitis linked to autism. However, other researchers were unable to reproduce his findings,[3][4] and a 2004 investigation by *Sunday Times* reporter Brian Deer identified undisclosed financial conflicts of interest on Wakefield's part.[5] Most of Wakefield's co-authors then withdrew their support for the study's interpretations,[6] and the British General Medical Council (GMC) conducted an inquiry into allegations of misconduct against Wakefield and two former colleagues,[7] focusing on Deer's findings.[8]

In 2010, the GMC found that Wakefield had been dishonest in his research, had acted against his patients' best interests and mistreated developmentally delayed children,[9] and had "failed in his duties as a responsible consultant".[10][11][12] *The Lancet* fully retracted Wakefield's 1998 publication on the basis of the GMC's findings, noting that elements of the manuscript had been falsified and that the journal had been "deceived" by Wakefield.[13][14] Three months later, Wakefield was struck off the UK medical register, due in part to his deliberate falsification of research published in *The Lancet*,[15] and was barred from practising medicine in the UK.[16] In a related legal decision, a British court held that "[t]here is now no respectable body of opinion which supports [Dr. Wakefield's] hypothesis, that MMR vaccine and autism/enterocolitis are causally linked".[17] Wakefield has continued to defend his research and conclusions, saying there was no fraud, hoax or profit motive.[18][19][20] In 2016, Wakefield directed the anti-vaccination film *Vaxxed: From Cover-Up to Catastrophe*.

Early life and education

Wakefield was born in 1957;[1][2] his father was a neurologist and his mother was a general practitioner.[21] After leaving the independent King Edward's School, Bath,[22] Wakefield studied medicine at St Mary's Hospital Medical School[21] (now Imperial College School of Medicine), fully qualifying in 1981.

Wakefield became a fellow of the Royal College of Surgeons in 1985.[2]

Career

At the University of Toronto from 1986 to 1989, he was a member of a team that studied tissue rejection problems with small intestine transplantation, using animal models.[23][24] He continued his studies of small intestine transplantation under a Wellcome Trust travelling fellowship at University of Toronto in Canada.[2]

Claims of measles virus–Crohn's disease link

Back in the UK, he worked on the liver transplant programme at the Royal Free Hospital in London.[2] In 1993, Wakefield attracted professional attention when he published reports in which he concluded that measles virus might cause Crohn's disease;[25] and two years later he published a paper in *The Lancet* proposing a link between the measles vaccine and Crohn's disease.[26] Subsequent research failed to confirm this hypothesis, with a group of experts in Britain reviewing a number of peer-reviewed studies in 1998 and concluding that the measles virus did not cause Crohn's disease, and neither did the MMR vaccine.[27]

Later, in 1995, while conducting research into Crohn's disease, he was approached by Rosemary Kessick, the parent of a child with autism, who was seeking help with her son's bowel problems and autism; Kessick ran a group called Allergy Induced Autism.[28] In 1996, Wakefield turned his attention to researching possible connections between the MMR vaccine and autism.[2]

At the time of his MMR research study, Wakefield was senior lecturer and honorary consultant in experimental gastroenterology at the Royal Free Hospital School of Medicine (from 2008, UCL Medical School). He resigned in 2001,[29] by "mutual agreement and was made a fellow of the Royal College of Pathologists",[30] and moved to the US in 2001[31] (or 2004, by another account).[30] He was reportedly asked to leave the Royal Free Hospital after refusing a request to validate his 1998 *Lancet* paper with a controlled study.[32]

Wakefield subsequently helped establish and served as the executive director of Thoughtful House Center for Children, which studies autism in Austin, Texas, where, according to *The Times*, he "continued to promote the theory of a link between the MMR vaccine and autism, despite admitting it was 'not proved'."[30] He resigned from Thoughtful House in February 2010, after the British General Medical Council found that he had been "dishonest and

irresponsible" in conducting his earlier autism research in England.[23][33] *The Times* reported in May 2010 that he was a medical advisor for Visceral, a UK charity that "researches bowel disease and developmental disorders".[30]

Wakefield is barred from practising as a physician in the UK,[16] and is not licensed in the US.[34] He lives in the US where he has a following, including the anti-vaccinationist Jenny McCarthy,[35] who wrote the foreword for Wakefield's autobiography, *Callous Disregard*. She has a son with autism-like symptoms that she believes were caused by the MMR vaccine.[36][37] According to Brian Deer, as of 2011, Wakefield lives near Austin with his family.[23][38]

Wakefield has set up the non-profit Strategic Autism Initiative to commission studies into the condition, and is currently listed as a director of a company called Medical Interventions for Autism and another called the Autism Media Channel.[38]

The Lancet fraud

Main article: Lancet MMR autism fraud

On 28 February 1998, Wakefield was the lead author of a study of twelve children with autism that was published in *The Lancet*. The study proposed a new syndrome called autistic enterocolitis, and raised the possibility of a link between a novel form of bowel disease, autism, and the MMR vaccine. The authors said that the parents of eight of the twelve children linked what were described as "behavioural symptoms" with MMR, and reported that the onset of these symptoms began within two weeks of MMR vaccination.

These possible triggers were reported as MMR in eight cases, and measles infection in one. The paper was instantly controversial, leading to widespread publicity in the UK and the convening of a special panel of the UK's Medical Research Council the following month.[39] One 2005 study in Japan found that there was no causal relationship between the MMR vaccine and autism in groups of children given the triple MMR vaccine and children who received individual measles, mumps and rubella vaccinations. In Japan, the MMR vaccine had been replaced with individual vaccinations in 1993.[40]

Although the paper said that no causal connection had been proven, before it was published, Wakefield made statements at a press conference and in a video news release issued by the hospital, calling for suspension of the triple MMR vaccine until more research could be done.[41] This was later criticized as 'science by press conference'.[42] According to BBC News, it was this press conference, rather than the paper in *The Lancet*, that fuelled the MMR vaccination scare.[43] The BBC report said he told journalists: "it was a 'moral issue' and he could no longer support the continued use of the three-in-one jab for measles, mumps and rubella. 'Urgent further research is needed to determine whether MMR may give rise to this complication in a small number of people,' Wakefield said at the time."[43] He said, "If you give three viruses together, three live viruses, then you potentially increase the risk of an adverse event occurring, particularly when one of those viruses influences the immune system in the way that measles does."[41] He suggested parents should opt for single vaccinations against measles, mumps and rubella, separated by gaps of one year. *60 Minutes* interviewed him in November 2000, and he repeated these claims to the U.S. audience, providing a new focus for the nascent anti-vaccination movement in the U.S., which had been primarily concerned about thiomersal in vaccines.[44][45] In December 2001, Wakefield resigned from the Royal Free Hospital, saying, "I have been asked to go because my research results are unpopular."[29] The medical school said that he had left "by mutual agreement". In February 2002, Wakefield stated: "What precipitated this crisis was the removal of the single vaccine, the removal of choice, and that is what has caused the furore—because the doctors, the gurus, are treating the public as though they are some kind of moronic mass who cannot make an informed decision for themselves."[46]

Aftermath of initial controversy

Wakefield continued to conduct clinical research in the United States after leaving the Royal Free Hospital in December 2001. He joined a controversial American researcher, Jeff Bradstreet, at the International Child Development Resource Center, to conduct further studies on the possible relationship between the MMR vaccine and autism.[47]

In 2004, Wakefield began working at the Thoughtful House research center in Austin, Texas.[48] Wakefield served as Executive Director of Thoughtful House until February 2010, when he resigned in the wake of findings against him by the British General Medical Council.[33][49]

In February 2004, the controversy resurfaced when Wakefield was accused of a conflict of interest. In *The Sunday Times*, Brian Deer reported that some of the parents of the 12 children in the study in *The Lancet* were recruited via a UK lawyer preparing a lawsuit against MMR manufacturers, and that the Royal Free Hospital had received £55,000 from the UK's Legal Aid Board (now the Legal Services Commission) to pay for the research.[50] Previously, in October 2003, the board had cut off public funding for the litigation against MMR manufacturers.[51] Following an investigation of the allegations in *The Sunday Times* by the UK General Medical Council, Wakefield was charged with serious professional misconduct, including dishonesty.[52] In December 2006, Deer, writing in *The Sunday Times*, further reported that in addition to the money they donated to the Royal Free Hospital, the lawyers responsible for the MMR lawsuit had paid Wakefield personally more than £400,000, which he had not previously disclosed.[53]

Twenty-four hours before the 2004 *Sunday Times* report by Deer, *The Lancet*'s editor Richard Horton responded to the investigation in a public statement, describing Wakefield's research as "fatally flawed" and said he believed the paper would have been rejected as biased if the peer reviewers had been aware of Wakefield's conflict of interest.[54] Ten of Wakefield's twelve co-authors of the paper in *The Lancet* later published a retraction of an interpretation.[55] The section of the paper retracted read as follows:

> Interpretation. We identified associated gastrointestinal disease and developmental regression in a group of previously normal children, which was generally associated in time with possible environmental triggers.

The retraction stated:[55]

> We wish to make it clear that in this paper no causal link was established between (the) vaccine and autism, as the data were insufficient. However the possibility of such a link was raised, and consequent events have had major implications for public health. In view of this, we

> consider now is the appropriate time that we should together formally retract the interpretation placed upon these findings in the paper, according to precedent.[56]

Wakefield v Channel 4 and others

In November 2004, Channel 4 broadcast a one-hour *Dispatches* investigation by reporter Brian Deer; the *Toronto Star* said Deer had "produced documentary evidence that Wakefield applied for a patent on a single-jab measles vaccine before his campaign against the MMR vaccine, raising questions about his motives".[23][57][58]

In addition to Wakefield's unpublished initial patent submission,[57] Deer released a copy of the published patent application.[59] At page 1, the first paragraph of this stated:

> The present invention relates to a new vaccine/immunisation for the prevention and/or prophylaxis against measles virus infection and to a pharmaceutical or therapeutic composition for the treatment of IBD (Inflammatory Bowel Disease); particularly Crohn's Disease and Ulcerative Colitis and regressive behavioural disease (RBD) (also referred to as "Pervasive Developmental Disorder).

Before describing the research in Wakefield's 1998 paper in *The Lancet*, at the same page this patent explicitly states that the use of the MMR vaccine causes autism:

> It has now also been shown that use of the MMR vaccine (which is taken to include live attenuated measles vaccine virus, measles virus, mumps vaccine virus and rubella vaccine virus, and wild strains of the aforementioned viruses) results in ileal lymphoid nodular hyperplasia, chronic colitis and pervasive developmental disorder including autism (RBD), in some infants.

According to Deer, a letter from Wakefield's lawyers to him dated 31 January 2005 said: "Dr Wakefield did not plan a rival vaccine."[57]

In the *Dispatches* programme, Deer also revealed that Nicholas Chadwick, a researcher working under Wakefield's supervision in the Royal Free medical school, had failed to find measles virus in the children reported on in *The Lancet*.[60]

In January 2005, Wakefield initiated libel proceedings against Channel 4, the independent production company Twenty Twenty and Brian Deer, *The Sunday Times*, and against Deer personally along with his website briandeer.com.[61] Within weeks of issuing his claims, however, Wakefield sought to have the action frozen until after the conclusion of General Medical Council proceedings against him. Channel 4 and Deer sought a High Court order compelling Wakefield to continue with his action, or discontinue it. After a hearing on 27 and 28 October 2005, Mr Justice David Eady ruled against a stay of proceedings:

> It thus appears that the Claimant wishes to use the existence of the libel proceedings for public relations purposes, and to deter other critics, while at the same time isolating himself from the "downside" of such litigation, in having to answer a substantial defence of justification ... I am quite satisfied, therefore, that the Claimant wished to extract whatever advantage he could from the existence of the proceedings while not wishing to progress them or to give the Defendants an opportunity of meeting the claims.[62]

The judgment identified Channel 4's "very lengthy extracts" summarizing Deer's allegations against Wakefield:[62]

> (i) [Wakefield] spread fear that the MMR vaccine might lead to autism, even though he knew that his own laboratory had carried out tests whose results dramatically contradicted his claims in that the measles virus had not been found in a single one of the children concerned in his study and he knew or ought to have known that there was absolutely no basis at all for his belief that the MMR should be broken up into single vaccines.
>
> (ii) In spreading such fear, acted dishonestly and for mercenary motives in that, although he improperly failed to disclose the fact, he planned a rival vaccine and products (such as a diagnostic kit based on his theory) that could have made his fortune
>
> (iii) Gravely abused the children under his care by unethically carrying out extensive invasive procedures (on occasions requiring three people to hold a child down), thereby driving nurses to leave and causing his medical colleagues serious concern and unhappiness
>
> (iv) Improperly and/or dishonestly failed to disclose to his colleagues and to the public that his research on autistic children had begun with a contract with solicitors who were trying to sue the manufacturers of the MMR vaccine
>
> (v) Improperly or dishonestly lent his reputation to the International Child Development Resource Centre, which promoted to very vulnerable parents expensive products for whose efficacy (as he knew or should have known) there was no scientific evidence

Mr. Justice Eady's ruling states that, "The views or conclusions of the GMC disciplinary body would not, so far as I can tell, be relevant or admissible", that Channel 4's allegations "go to undermine fundamentally the Claimant's professional integrity and honesty", and that, "It cannot seriously be suggested that priority should be given to GMC proceedings for the resolution of issues."

In December 2006, Deer released records obtained from the Legal Services Commission, showing that it had paid £435,643 in undisclosed fees to Wakefield for the purpose of building a case against the MMR vaccine.[63] Those payments, *The Sunday Times* reported, had begun two years before publication of Wakefield's paper in *The Lancet*.[53] Within days of Deer's report, Wakefield dropped all his libel actions[64] and was ordered to pay all defendants' legal costs.[65][66]

Other concerns

Wakefield's data was also questioned;[67] a former graduate student, who appeared in Deer's programme, later testified that Wakefield ignored laboratory data that conflicted with his hypothesis. An independent investigation of a collaborating laboratory questioned the accuracy of the data underpinning Wakefield's claims.[68]

In June 2005, the BBC programme *Horizon* reported on an unnamed and unpublished study of blood samples from a group of 100 autistic children and 200 children without autism. They reported finding 99% of the samples contained no trace of the measles virus, and the samples that did contain the virus were just as likely to be from non-autistic children, i.e., only three samples contained the measles virus, one from an autistic child and two from a typically developing child. The study's authors found no evidence of any link between MMR and autism.[69]

The Institute of Medicine (IOM) of the United States National Academy of Sciences,[70] along with the CDC[71] and the UK National Health Service,[72] have found no link between vaccines and autism. Reviews in the medical literature have also found no link between the MMR vaccine and autism or with bowel disease, which Wakefield called "autistic enterocolitis".[73][74][75]

General Medical Council hearings

Between July 2007 and May 2010, a 217-day "fitness to practise" hearing of the UK General Medical Council examined charges of professional misconduct against Wakefield and two colleagues involved in the paper in *The Lancet*.[76][77] The charges included that he:

- "Was being paid to conduct the study by solicitors representing parents who believed their children had been harmed by MMR".[76]
- Ordered investigations "without the requisite paediatric qualifications" including colonoscopies, colon biopsies and lumbar punctures ("spinal taps") on his research subjects without the approval of his department's ethics board and contrary to the children's clinical interests,[76] when these diagnostic tests were not indicated by the children's symptoms or medical history.
- "Act[ed] 'dishonestly and irresponsibly' in failing to disclose ... how patients were recruited for the study"[76] as well as in his descriptions in the Lancet papers and in questions after the paper published, about what ailments the children had, and when those ailments were observed relative to their getting vaccinated.[78][79]:Paragraphs 33–36, pp 45–48
- "Conduct[ed] the study on a basis not approved by the hospital's ethics committee."[76]
- Purchased blood samples—for £5 each—from children present at his son's birthday party, which Wakefield joked about in a later presentation.[76]
- "[S]howed callous disregard for any distress or pain the children might suffer"[15]

Wakefield denied the charges;[80] on 28 January 2010, the GMC ruled against Wakefield on all issues, stating that he had "failed in his duties as a responsible consultant",[10] acted against the interests of his patients,[10] and "dishonestly and irresponsibly" in his controversial research.[11] On 24 May 2010, he was struck off the United Kingdom medical register. It was the harshest sanction that the GMC could impose, and effectively ended his career as a physician. In announcing the ruling, the GMC said that Wakefield had "brought the medical profession into disrepute", and no sanction short of erasing his name from the register was appropriate for the "serious and wide-ranging findings" of misconduct.[16][81] On the same day, Wakefield's autobiography, *Callous Disregard* was published, using the same words as one of the charges against him ("he showed callous disregard for any distress or pain the children might suffer").[15] Wakefield argued that he had been unfairly treated by the medical and scientific establishment.[82]

Fraud and conflict of interest allegations

In February 2009, *The Sunday Times* reported that a further investigation by the newspaper had revealed that Wakefield "changed and misreported results in his research, creating the appearance of a possible link with autism",[83] citing evidence obtained by the newspaper from medical records and interviews with witnesses, and supported by evidence presented to the GMC.

In April 2010, Deer expanded on laboratory aspects of his findings in a report in the *BMJ*, recounting how normal clinical histopathology results (obtained from the Royal Free hospital) had been subjected to wholesale changes, from normal to abnormal, in the medical school and published in *The Lancet*.[84] On 2 January 2011, Deer provided two tables comparing the data on the twelve children, showing the original hospital data and the data with the wholesale changes as used in the 1998 *The Lancet* article.[85]

On 5 January 2011, *BMJ* published an article by Brian Deer entitled "How the case against the MMR vaccine was fixed".[86] Deer said that, based on examination of the medical records of the 12 children in the original study, his research had found:[86]

> The paper in *The Lancet* was a case series of 12 child patients; it reported a proposed "new syndrome" of enterocolitis and regressive autism and associated this with MMR as an "apparent precipitating event." But in fact:
>
> > Three of nine children reported with regressive autism did not have autism diagnosed at all. Only one child clearly had regressive autism;
> >
> > Despite the paper claiming that all 12 children were "previously normal", five had documented pre-existing developmental concerns;
> >
> > Some children were reported to have experienced first behavioural symptoms within days of MMR, but the records documented these as starting some months after vaccination;
> >
> > In nine cases, unremarkable colonic histopathology results—noting no or minimal fluctuations in inflammatory cell populations—were changed after a medical school "research review" to "non-specific colitis";
> >
> > The parents of eight children were reported as blaming MMR, but 11 families made this allegation at the hospital. The exclusion of three allegations—all giving times to onset of problems in months—helped to create the appearance of a 14-day temporal link;
> >
> > Patients were recruited through anti-MMR campaigners, and the study was commissioned and funded for planned litigation.[86]

In an accompanying editorial, *BMJ* editors said:

> Clear evidence of falsification of data should now close the door on this damaging vaccine scare ... Who perpetrated this fraud? There is no doubt that it was Wakefield. Is it possible that he was wrong, but not dishonest: that he was so incompetent that he was unable to fairly describe the project, or to report even one of the 12 children's cases accurately? No. A great deal of thought and effort must have gone into drafting the paper to achieve the results he wanted: the discrepancies all led in one direction; misreporting was gross. Moreover, although the scale of the GMC's 217-day hearing precluded additional charges focused directly on the fraud, the panel found him guilty of dishonesty concerning the study's admissions criteria, its funding by the Legal Aid Board, and his statements about it afterwards.[87]

The *British Medical Journal* editorial concluded that Wakefield's paper was an "elaborate fraud".[88][87]

In a *BMJ* follow-up article on 11 January 2011,[32] Deer stated that Wakefield had planned to capitalize on the MMR vaccination scare provoked by his paper.[89] He said that based upon documents he had obtained under Freedom of information legislation,[90] Wakefield—in partnership with the father of one of the boys in the study—had planned to launch a venture on the back of an MMR vaccination scare that would profit from new medical tests and "litigation driven testing".[89][57] *The Washington Post* reported that Deer said that Wakefield predicted he "could make more than $43 million a year from diagnostic kits" for the new condition, autistic enterocolitis.[90] According to Deer's report in *BMJ*, the ventures, Immunospecifics Biotechnologies Ltd and Carmel Healthcare Ltd —named after Wakefield's wife—failed after Wakefield's superiors at University College London's medical school gave him a two-page letter that said:

> We remain concerned about a possible serious conflict of interest between your academic employment by UCL, and your involvement with Carmel ... This concern arose originally because the company's business plan appears to depend on premature, scientifically unjustified publication of results, which do not conform to the rigorous academic and scientific standards that are generally expected.[32]

WebMD reported on Deer's *BMJ* report, saying that the $43 million predicted yearly profits would come from marketing kits for "diagnosing patients with autism" and that "the initial market for the diagnostic will be litigation-driven testing of patients with AE [autistic enterocolitis, an unproven condition concocted by Wakefield] from both the UK and the US".[91] According to WebMD, the *BMJ* article also claimed that Carmel Healthcare Ltd. would succeed in marketing products and developing a replacement vaccine if "public confidence in the MMR vaccine was damaged".[91]

In October 2012, research published in PNAS, the Proceedings of the National Academy of Sciences, identified Wakefield's 1998 paper as the most cited retracted scientific paper, with 758 citations, and gave the "reason for retraction" as "fraud".[92]

Journal retractions

On 2 February 2010, *The Lancet* formally retracted Wakefield's 1998 paper.[93][94][95] The retraction states: "The claims in the original paper that children were 'consecutively referred' and that investigations were 'approved' by the local ethics committee have been proven to be false."[13]

The following day, the editor of a specialist journal, *Neurotoxicology*, withdrew another Wakefield paper that was in press. The article, which concerned research on monkeys, had already been published online and sought to implicate vaccines in autism.[96]

In May 2010, *The American Journal of Gastroenterology* retracted a paper of Wakefield's that used data from the 12 patients of the article in *The Lancet*.[97]

On 5 January 2011, *British Medical Journal* editors recommended that Wakefield's other publications should be scrutinized and retracted if need be.[35]

Wakefield response

As of January 2011, Wakefield continued to maintain his innocence. In a press release, he stated,

> I want to make one thing crystal clear for the record—my research and the serious medical problems found in those children were not a hoax and there was no fraud whatsoever. Nor did I seek to profit from our findings ... despite media reports to the contrary, the results of my research have been duplicated in five other countries ... I continue to fully support more independent research to determine if environmental triggers, including vaccines, are causing autism and other developmental problems ... Since the Lancet [sic] paper, I have lost my job, my career and my country. To claim that my motivation was profit is patently untrue. I will not be deterred—this issue is far too important.[18]

In an Internet radio interview, Wakefield said the *BMJ* series "was utter nonsense" and denied "that he used the cases of the 12 children in his study to promote his business venture". Deer has filed financial disclosure forms and rejects Wakefield's claim that he is funded by the pharmaceutical industry.[89] According to CNN, Wakefield said the patent he held was for "an 'over-the-counter nutritional supplement' that boosts the immune system".[89] WebMD reported that Wakefield said he was the victim of "a ruthless, pragmatic attempt to crush any attempt to investigate valid vaccine safety concerns".[91]

Wakefield says that Deer is a "hit man who was brought in to take [him] down" and that other scientists have simply taken Deer at his word. While on *Anderson Cooper 360°*, he said that he had not read the *BMJ* articles yet, but he denied their validity and denied that Deer had interviewed the families of the children in the study. He also urged viewers to read his book, *Callous Disregard*, which he said would explain why he was being targeted, to which Anderson Cooper replied: "But sir, if you're lying, then your book is also a lie. If your study is a lie, your book is a lie."[98][99]

Wakefield later implied that there is a conspiracy by public health officials and pharmaceutical companies to discredit him, including suggesting they pay bloggers to post rumours about him on websites or that they artificially inflated reports of deaths from measles.[98]

Deer counter-response

Deer responded to Wakefield's charge by challenging Wakefield to sue him:

> If it is true that Andrew Wakefield is not guilty as charged, he has the remedy of bringing a libel action against myself, *The Sunday Times* of London, against the medical journal here, and he would be the richest man in America.[100]

Deer mentioned that all of Wakefield's previous libel actions had been dismissed or withdrawn.[62][100]

In January 2012, Wakefield filed a defamation lawsuit in Texas state court against Deer, Fiona Godlee, and the *BMJ* for false accusations of fraud, seeking a jury trial in Travis County. The filing identified Wakefield as a resident of Austin,[101][102] and cited the "Texas Long-Arm Statute" as justification for initiating the proceeding in Texas. The *BMJ* responded that it stood by its reports and would "defend the claim vigorously".[103][104] In August 2012 District Court Judge Amy Meachum dismissed Wakefield's suit for lack of jurisdiction.[105][106] Her ruling was upheld on appeal in September 2014 and Wakefield was ordered to pay all parties' costs.[107][108]

On 5 April 2011, Deer was named the UK's specialist journalist of the year in the British Press Awards, organised by the Society of Editors. The judges said that Deer's investigation of Wakefield was a "tremendous righting of a wrong".[109]

Epidemics, effects, and reception

See also: 2013 Swansea measles epidemic and Measles outbreaks in the 21st century

Physicians, medical journals, and editors have made statements tying Wakefield's fraudulent actions to various epidemics and deaths.[116] Michael J. Smith, a professor of pediatrics at the University of Louisville, an "infectious diseases expert who has studied the autism controversy's effect on immunization rates", said, "Clearly, the results of this [Wakefield] study have had repercussions."[117][118]

Wakefield's study and his claim that the MMR vaccine might cause autism led to a decline in vaccination rates in the United States, the United Kingdom, and Ireland, and a corresponding rise in measles and mumps infections, resulting in serious illness and deaths. His continued claims that the vaccine is harmful have contributed to a climate of distrust of all vaccines and the reemergence of other previously-controlled diseases.[119][67][36]

The Associated Press said:

> Immunization rates in Britain dropped from 92 percent to 73 percent, and were as low as 50 percent in some parts of London. The effect was not nearly as dramatic in the United States, but researchers have estimated that as many as 125,000 US children born in the late 1990s did not get the MMR vaccine because of the Wakefield splash.[117]

ABC News Channel WWAY3 said:

> Since Dr. Andrew Wakefield's study was released in 1998, many parents have been convinced the measles, mumps and rubella vaccine could lead to autism. But that study may have done more harm than good. According to the Centers for Disease Control and Prevention, in the United States, more cases of measles were reported in 2008 than any year since 1997. More than 90 percent of those infected had not been vaccinated, or their vaccination status was not known.[115]

Paul Hébert, editor-in-chief of the *Canadian Medical Association Journal* (CMAJ) said:

> There has been a huge impact from the Wakefield fiasco ... This spawned a whole anti-vaccine movement. Great Britain has seen measles outbreaks. It probably resulted in a lot of deaths.[23]

A profile in a *New York Times Magazine* article commented:

> Andrew Wakefield has become one of the most reviled doctors of his generation, blamed directly and indirectly, depending on the accuser, for irresponsibly starting a panic with tragic repercussions: vaccination rates so low that childhood diseases once all but eradicated here—whooping cough and measles, among them—have re-emerged, endangering young lives.[98]

Journalist Brian Deer called for criminal charges against Wakefield.[100]

On 1 April 2011, the James Randi Educational Foundation awarded Wakefield the Pigasus Award for "refusal to face reality".[120]

A 2011 journal article described the vaccine-autism connection as "the most damaging medical hoax of the last 100 years".[121]

In 2011, Wakefield was at the top of the list of the worst doctors of 2011 in *Medscape*'s list of "Physicians of the Year: Best and Worst".[122] In January 2012, *Time* magazine named Wakefield in a list of "Great Science Frauds".[123] In 2012 he was awarded the Lifetime Achievement in Quackery award by the Good Thinking Society.[124]

A writer from *The New York Times*, who was covering a 2011 event in Tomball, Texas where Wakefield spoke, was threatened by its organizer, Michelle Guppy: "Be nice to him, or we will hurt you." Guppy is the coordinator of the Houston Autism Disability Network.[98]

In June 2012, a local court in Rimini, Italy, ruled that the MMR vaccination had caused autism in a 15-month-old boy. The court relied heavily on Wakefield's discredited *Lancet* paper and largely ignored the scientific evidence presented to it. The decision was appealed.[125] On 13 February 2015, the decision was overturned by a Court of Appeals in Bologna.[126]

In February 2015, Wakefield denied that he bore any responsibility for the measles epidemic that started at Disneyland. He also reaffirmed his discredited belief that "MMR contributes to the current autism epidemic".[127] By that time at least 166 measles cases had been reported. Paul Offit did not agree, saying that the outbreak was "directly related to Dr. Wakefield's theory".[128]

Filmmaker Miranda Bailey followed Wakefield and his wife Carmel and their children for five years filming a documentary about Wakefield as a person, *The Pathological Optimist*. According to Robert Ladendorf writing for *Skeptical Inquirer* magazine, Bailey attempted to remain neutral and add a "human touch", which Ladendorf says was successful. Wakefield is shown "as a soft-spoken but beleaguered family man trying to resurrect his reputation and raising money

for his legal fund."[129]

In 2018, *The Skeptic* awarded Wakefield the Rusty Razor award "for pseudoscience and bad critical thinking."[130][131] The award is decided annually by readers' votes. Editor Deborah Hyde said, "Our contributors clearly felt that anti-vaccination damage is still a current issue, despite Mr. Wakefield first having come to public attention so long ago. These childhood diseases can do real damage, so we're proud to be an organisation that gets the good news out there – the evidence is overwhelming that vaccination is safe. Protect your children and your community by using it."[132]

Political activism

Wakefield was scheduled to testify before the Oregon Senate Health Care Committee on 9 March 2015, in opposition to Senate Bill 442,[133] "a bill that would eliminate nonmedical exemptions from Oregon's school immunization law".

The Oregon Chiropractic Association had invited him. The chairman of the committee then canceled the meeting "after it became clear that" Wakefield planned to testify. She denied that her decision had anything to do with Wakefield's plans.[134]

On 24 April 2015, Wakefield received two standing ovations from the students at Life Chiropractic College West when he told them to oppose Senate Bill SB277, a bill that proposes elimination of non-medical vaccine exemptions.[135] Wakefield had previously been a featured speaker at a 2014 "California Jam" gathering of chiropractors,[136] as well as a 2015 "California Jam" seminar, with continuing education credits, sponsored by Life Chiropractic College West.[137] On 3 July 2015, Wakefield participated in a protest held in Santa Monica, California, against SB 277,[138] a recently enacted bill which removed the personal belief exemption to school vaccine requirements in California state law.[139]

Vaxxed film

Main article: Vaxxed

In 2016, Wakefield directed the anti-vaccination propaganda film *Vaxxed: From Cover-Up to Catastrophe*.[145] The film purports to show "an appalling cover-up committed by the government agency charged with protecting the health of American citizens [the US Centers for Disease Control and Prevention (CDC)] ... an alarming deception that has contributed to the skyrocketing increase of autism and potentially the most catastrophic epidemic of our lifetime."[146] The film was withdrawn from New York's 2016 Tribeca Film Festival after the festival's founder Robert De Niro (who has a child with autism) reversed his decision to include it.[147] Wakefield called this action censorship.[148] Ian Lipkin, professor of epidemiology and director of the Center for Infection and Immunity at the Columbia University Mailman School of Public Health, writing in *The Wall Street Journal*, said: "If *Vaxxed* had been submitted as science fiction, it would merit attention for its story line, character development and dialogue. But as a documentary it misrepresents what science knows about autism, undermines public confidence in the safety and efficacy of vaccines, and attacks the integrity of legitimate scientists and public-health officials".[149]

- Scientific career Fields : Genetics
- Institutions : Yale School of Medicine
- Influenced [**Dr. Francis Sellers Collins (born 1950)**]

Sherman Morton Weissman is an American scientist and the Sterling Professor of Genetics at the Yale School of Medicine. A mentor to [**Dr. Francis Sellers Collins (born 1950)**], Weissman elucidated the nucleic acid sequence of the SV40 genome.

Biography

Weissman was the son of a general practitioner. After attending Harvard Medical School, Weissman interned at Boston City Hospital and was a research fellow with the National Institutes of Health and the National Cancer Institute before taking a faculty position at Yale.[1]

Weissman mentored [**Dr. Francis Sellers Collins (born 1950)**], the director of the NIH, during Collins's postdoctoral fellowship at Yale.[2] Collins called Weissman "the smartest guy" he has met[3] and credited Weissman with allowing him to establish autonomy as a researcher. In Weissman's lab, Collins developed the technique known as chromosome jumping.[4]

In 1978, Weissman published the complete nucleic acid sequence of the SV40 genome. A week later, Belgian researcher Walter Fiers published the genome sequence in another journal. Until 1 ½ years earlier, the Weissman and Fiers teams had each been working on separate halves of the sequence. As technology allowed for faster sequencing, each team began to work toward sequencing the entire genome on its own. In the months before he came up with the published sequence, Weissman had to retract several "final" sequences once errors were discovered.[5] Weissman was elected to the National Academy of Sciences in 1983.[6]

Weissman's seven children include Jonathan Weissman, a scientist at the Massachusetts Institute of Technology. Jonathan's mother is Myrna Weissman, a professor of epidemiology in psychiatry at Columbia University.[7]

Arthur Horwich

Jonathan S. Weissman is the Landon T. Clay Professor of Biology at the Massachusetts Institute of Technology, a member of the Whitehead Institute, and a Howard Hughes Medical Institute Investigator. From 1996 to 2020, he was a faculty member in the department of Cellular Molecular Pharmacology at the University of California, San Francisco.

Education[edit]

He earned his B.A. in Physics from Harvard College (1988) and his Ph.D. in Physics (1993) from MIT working with Peter Kim. There, he started his studies on protein folding examining Bovine pancreatic trypsin inhibitor (BPTI).[1]

He was a postdoctoral fellow at Yale University (1993-1996), where he worked with Arthur Horwich studying the mechanism of GroEL.[2][3]

Career[edit]

Weissman's research team studies how cells ensure that proteins fold into their correct shape, as well as the role of protein misfolding in disease and normal physiology. The team also develops experimental and analytical approaches for exploring the organizational principles of biological systems and globally monitoring protein translation through ribosome profiling. A broad goal of his work is to bridge large-scale approaches and in depth mechanistic investigations to reveal the information encoded within genomes.[4][5][6]

Weissman has been a member of the National Academy of Sciences since 2009.

In late summer 1999, an outbreak of human encephalitis occurred in the north- eastern United States that was concurrent with extensive mortality in crows (Corvus species) as well as the deaths of several exotic birds at a zoological park in the same area. Complete genome sequencing of a flavivirus isolated from the brain of a dead Chilean flamingo (Phoenicopterus chilensis), together with partial sequence analysis of envelope glycoprotein (E-glycoprotein) genes amplified from several other species including mosquitoes and two fatal human cases, revealed that West Nile (WN) virus circulated in natural transmission cycles and was responsible for the human disease. Antigenic mapping with E-glycoprotein–specific monoclonal antibodies and E-glycoprotein phylogenetic analysis confirmed these viruses as WN. This North American WN virus was most closely related to a WN virus isolated from a dead goose in Israel in 1998.

5% CO_2. Cells were examined for cytopathologic effect for up to 7 days after inoculation.

5. Total numbers of mosquitoes by species that were collected in 14 towns in Fairfield County, CT, and tested for virus from 6 September through 14 October 1999: *Ae. vexans*, 1688; *Ae. cinereus*, 172; *Ae. trivittatus*, 131; *Ae. taeniorhynchus*, 123; *Ae. sollicitans*, 109; *Ae. cantator*, 63; *Ae. triseriatus*, 28; *Ae. japonicus*, 19; *Ae. canadensis*, 1; *Anopheles punctipennis*, 82; *An. quadrimaculatus*, 4; *An. walkeri*, 2; *Coquillettidia perturbans*, 15; *Culex pipiens*, 744; *Cx. restuans*, 27; *Cx. erraticus*, 4; *Cx. territans*, 1; *Culiseta melanura*, 76; *Cs. morsitans*, 1; *Psorophora ferox*, 4; and *Uranotaenia sapphirina*, 104.
6. M. Z. Ansari, R. E. Shope, S. Malik, *J. Clin. Lab. Anal.* **7**, 230 (1993). Isolates were tested initially in an ELISA against reference antibodies to six viruses, in three families, isolated from mosquitoes in North America. The antibodies were prepared in mice and provided by the World Health Organization Center for Arbovirus Research and Reference, Yale Arbovirus Research Unit, Department of Epidemiology and Public Health, Yale University School of Medicine. The antibodies were to Eastern Equine Encephalomyelitis, Highlands J, Cache Valley, LaCrosse, Jamestown Canyon, and St. Louis Encephalitis viruses.
7. Most dead birds were collected by state or town personnel in Connecticut and sent to the Pathobiology Department at the University of Connecticut, Storrs, where they were examined for postmortem and nutritional condition, gross lesions, and microscopic evidence indicative of encephalitis. Brain tissue from birds with presumed encephalitis were frozen at −70°C and then sent to the Connecticut Agricultural Experiment Station, New Haven, for virus testing. Corresponding brain sections were processed for histologic examination. A 10% suspension of each sampled brain tissue was prepared in 1.5 ml of phosphate-buffered saline by triturating with a mortar and pestle (*9*). Two to seven tissue samples from each bird were tested for virus. Aluminum was added to facilitate homogenization of tissue. Suspensions were centrifuged at 520*g* for 10 min. The supernatant of each sample was then passed through a 0.22-μm filter before inoculation of a 100-μl sample onto a monolayer of Vero cells. Cells were grown and examined for cytopathologic effect (*3*). Isolates were initially tested against reference antibodies (*6*).
8. Connecticut towns from which dead crows were collected and virus isolated from brain tissues (number of isolates in parentheses): Bridgeport (n = 1), Darien (n = 1), Fairfield (n = 4), Greenwich (n = 3), Hamden (n = 1), Madison (n = 1), Milford (n = 1), New Canaan (n = 1), New Haven (n = 3), North Haven (n = 1), Norwalk (n = 1), Redding (n = 1), Stamford (n = 5), Stratford (n = 1), Weston (n = 1), Westport (n = 1), and Woodbridge (n = 1).
9. The Cooper's hawk was observed alive on the ground on 25 September 1999 and was described as having difficulty standing, spinning in circles, and having seizures. It died 11 hours after being found. Gross pathology of the brain showed extensive hemorrhage.
10. D. L. Swofford, *PAUP: Phylogenetic Analysis Using Parsimony Users Manual* (Illinois Natural History Survey, Champaign, 1993). Data were analyzed by PAUP 4b.1 with maximum parsimony, maximum likelihood, and neighbor-joining analysis. The data set was identical for all analyses. A total of 933 characters was used, including insertions created during [Clustal X] alignment. All characters were unordered and had equal weight; all sites were assumed to evolve at the same rate. Four hundred and forty-six characters were constant, 281 characters were parsimony-uninformative, and 206 characters were parsimony-informative. Gaps were treated as missing. For maximum parsimony analysis, the best tree found = 754; number of trees retained = 1. The branch and bound method of search was used to guarantee finding the shortest tree (or trees). For the bootstrap analysis, 500 replicates were run with the maximum parsimony method. Maximum likelihood analysis settings corresponded to the Felsenstein model. Transition/transversion ratio = 2 [κ = 3.88125]; molecular clock was not enforced; trees with approximate likelihoods of 5% or further from the target score were rejected without additional iteration; "MulTrees" option was in effect; topological constraints were not enforced. Score for best tree found by maximum likelihood analysis = 42782.24084; number of trees retained = 1. Trees were run as unrooted. Passage 2 of each virus isolate was grown in Vero cells (*3*) at 37°C. Infected cells were scraped from the bottom of the flask, centrifuged at 450*g* for 10 min, and the supernatant was discarded. RNA was extracted from the pellet using the Roesay mini protocol (Jiagen), eluting the column twice with 40 μl of ribonuclease-free water. Two microliters of each eluate were used in a 50-μl reverse transcription–polymerase chain reaction (RT-PCR) with the GeneAmp EZ rTth RNA PCR kit (Perkin-Elmer). Primers WN-233F-CACTGAGAGCGCCAATGTTGAGC and WN-1189R-GCAATAACTGCCGACYTCTGC used in the reaction were designed to specifically amplify WN and Kunjin viruses based on an alignment of six flavivirus isolates listed in GenBank [SLE virus capsid, membrane, envelope: accession M16614; Japanese encephalitis virus polyprotein: accession M73710; Kunjin virus gene for polyprotein: accession D00246; Nigerian WN virus complete genome: accession M12294; Romania WN virus strain 8097-50 polyprotein gene, partial, accession AF130362, Romania WN virus strain 96-1030 polyprotein gene, accession AF130363]. PCR products were purified with the QIAquick PCR Purification Kit (Qiagen) and submitted to the Keck Biotechnology Center at Yale University, New Haven, CT, for sequencing. Sequences were aligned with Clustalx 1.64B [J. D. Thompson, D. G. Higgins, T. J. Gibson, *Nucleic Acids Res.* **22**, 4673 (1994)].

Origin of the West Nile Virus Responsible for an Outbreak of Encephalitis in the Northeastern United States

R. S. Lanciotti,[1]* J. T. Roehrig,[1] V. Deubel,[2] J. Smith,[3] M. Parker,[3] K. Steele,[3] B. Crise,[3] K. E. Volpe,[1] M. B. Crabtree,[1] J. H. Scherret,[4] R. A. Hall,[4] J. S. MacKenzie,[4] C. B. Cropp,[1] B. Panigrahy,[5] E. Ostlund,[5] B. Schmitt,[5] M. Malkinson,[6] C. Banet,[6] J. Weissman,[6] N. Komar,[1] H. M. Savage,[1] W. Stone,[7] T. McNamara,[8] D. J. Gubler[1]

In late summer 1999, an outbreak of human encephalitis occurred in the northeastern United States that was concurrent with extensive mortality in crows (*Corvus* species) as well as the deaths of several exotic birds at a zoological park in the same area. Complete genome sequencing of a flavivirus isolated from the brain of a dead Chilean flamingo (*Phoenicopterus chilensis*), together with partial sequence analysis of envelope glycoprotein (E-glycoprotein) genes amplified from several other species including mosquitoes and two fatal human cases, revealed that West Nile (WN) virus circulated in natural transmission cycles and was responsible for the human disease. Antigenic mapping with E-glycoprotein–specific monoclonal antibodies and E-glycoprotein phylogenetic analysis confirmed these viruses as WN. This North American WN virus was most closely related to a WN virus isolated from a dead goose in Israel in 1998.

In late August and early September 1999, New York City and surrounding areas experienced an outbreak of human encephalitis consistent with an arboviral etiology. Serological evidence from this outbreak implicated a flavivirus as the etiologic agent. Concurrent with this human encephalitis outbreak, a viral encephalitis of unknown etiology was discovered in American crows (*Corvus brachyrhynchos*) and fish crows (*Corvus ossifragus*) dying in the same geographic area. Deaths were also observed among several exotic avian species, including a Chilean flamingo (*Phoenicopterus chilensis*) at the Bronx Zoo. Necropsy samples from these birds were submitted to the National Veterinary Services Laboratories, U.S. Department of Agriculture, and were inoculated into embryonated chicken eggs for virus isolation. Flavivirus particles (diameter 40 nm) were observed by electron microscopy in the allantoic fluid 4 days after inoculation. The isolates were forwarded to the Centers for Disease Control and Prevention (CDC) for identification.

The complete nucleotide sequence of one of these viral isolates (WN-NY99, from the dead Chilean flamingo) has now been determined. The viral genomic RNA was amplified and copied into overlapping DNA fragments of ~2 to 3 kb by means of the reverse transcription polymerase chain reaction (RT-PCR) (*1*). Both strands of the purified DNAs were sequenced with the use of primers spaced about 400 bases apart along the entire genome. The complete 11,029-nucleotide genomic sequence of WN-NY99 has been submitted to GenBank (accession number AF196835). The deduced amino acid sequence of the coding region of WN-NY99 (genomic positions 97 to 10,395) is shown in Fig. 1. The WN-NY99 virus genome exhibited standard flavivirus genomic organization, the same overall genomic organization as was described for the WN-Nigeria and Kunjin (KUN) viruses (*2*). A short 5′ noncoding region of 96 nucleotides is followed by an ATG initiation codon at position 97 and a single open reading frame of 10,302 nucleotides coding for three structural proteins—capsid, premembrane (prM), and envelope (E)—and five nonstructural proteins (NS1, NS2a/NS2b, NS3, NS4a/NS4b, and NS5). The coding region of WN-NY99 is followed by a 3′ noncoding region of 631 nucleotides.

To identify the New York virus antigenically, we performed indirect immunofluorescence antibody tests using a panel of well-defined monoclonal antibodies (mAbs) to map various isolates from birds and mosquitoes. The mAb end-point titers with the North American isolates were compared to titers derived with other representatives of the Japanese encephalitis (JE) virus serocomplex of flaviviruses (Table 1). These mAbs, which are specific for the E-glycoprotein, can distinguish WN virus from KUN virus and can also distinguish either of these viruses from other members of the JE virus serocomplex. Viruses were grown in Vero cells, spotted onto 12-well slides, air-dried, and fixed with acetone before staining. All viruses reacted similarly with the broad flavivirus-reactive, positive-control mAb 4G2 (*3*, *4*). None of these viruses reacted with the negative-control antibody, which is specific for the E1 glycoprotein of eastern equine encephalitis (EEE), an unrelated alphavirus (*5*). All WN isolates, including those from North America, reacted especially with the WN virus–specific mAb H5.46, but not with the KUN

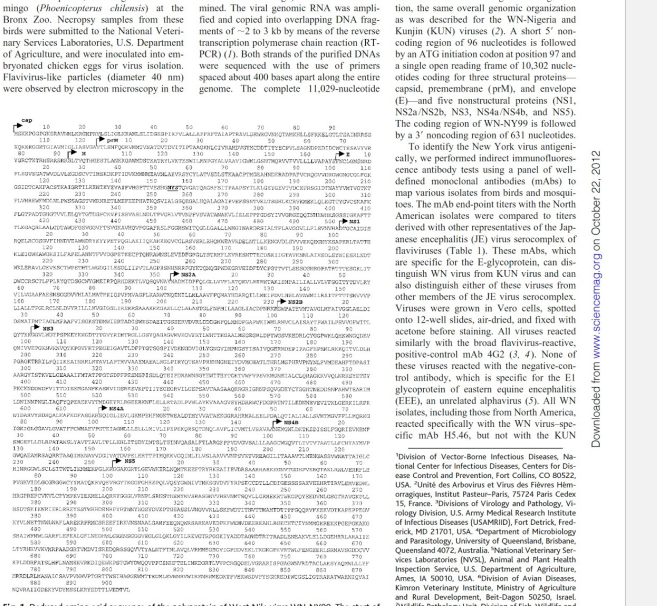

Fig. 1. Deduced amino acid sequence of the polyprotein of West Nile virus WN-NY99. The start of each protein is marked by an arrow. Abbreviations for protein names: cap, nucleocapsid; prM, premembrane protein; M, viral membrane protein; E, viral envelope glycoprotein; NS1 to NS5, viral nonstructural proteins. The E-glycoprotein glycosylation motif (NYS) is underlined. Single-letter abbreviations for amino acid residues are as follows: A, Ala; C, Cys; D, Asp; E, Glu; F, Phe; G, Gly; H, His; I, Ile; K, Lys; L, Leu; M, Met; N, Asn; P, Pro; Q, Gln; R, Arg; S, Ser; T, Thr; V, Val; W, Trp; and Y, Tyr.

virus–specific mAb 10A1 (four- to eightfold titer differences) (*6*–*8*). Similarly, only KUN virus reacted with mAb 10A1, but not with mAb H5.46. No KUN or WN viruses reacted with either the St. Louis encephalitis (SLE) virus–specific mAb 6B5A-2 or the Murray Valley encephalitis (MVE) virus–specific mAb 4B6C-2 (*9*, *10*). These results type the North American isolates as WN virus and not as KUN, SLE, or MVE viruses.

WN virus belongs to the family Flaviviridae, genus *Flavivirus*, and is a member of the JE virus serocomplex, which also includes JE, SLE, MVE, and KUN viruses, among others (*11*). Flaviviruses are plus-sense, single-stranded RNA viruses with a genome of ~11,000 nucleotides (*2*). Recently published sequence and phylogenetic data suggest that, within this serocomplex, KUN viruses appear to be a subtype of WN virus rather than a separate viral species (*12*). Although flaviviruses are closely related to each other antigenically and cross-react in serological tests with polyclonal antisera, most have a rather distinctive geographic distribution. Those of the JE serocomplex are maintained in a natural transmission cycle involving mosquito vectors and bird reservoir hosts. Humans and horses are usually incidental hosts.

To determine more precisely the relationships between the WN-NY99 virus and other related virus strains, we performed a phylogenetic analysis on an informative region of the E-glycoprotein gene (genome positions 1402 to 1656) (*12*, *13*). Aligned nucleic acid sequence data from 33 WN viruses, seven KUN viruses, and one JE virus were analyzed with the use of algorithms for parsimony (PAUP), distance (MEGA; Fig. 2), and maximum likelihood (fastDNAml) (*14*–*17*). The phylogenetic trees generated by these analyses had the same overall topology as that previously observed, insofar as all WN and KUN viruses are separated into two major lineages (*12*, *13*). Viruses in lineage 1 are primarily of West African, Middle Eastern, Eastern European, and Australian origin. Lineage 2 consists exclusively of viruses from the African continent that have apparently not been involved in human or equine outbreaks, but rather are maintained in enzootic cycles.

Within lineage 1, the KUN viruses and the Indian WN viruses both appear as monophyletic sister clades to the European and African WN viruses. The WN-NY99 virus is found within lineage 1 and is most closely related to WN viruses that have recently been isolated from North Africa, Romania, Kenya, Italy, and the Middle East. Of particular note is the close relationship between the WN-NY99 virus and a WN virus isolated from the brain of a dead goose in Israel in 1998. Phylogenetic analysis of a portion of the gene encoding the NS5 protein and of the 3′ noncoding region (830 bases) of 12 WN and KUN viruses also generates trees with nearly identical topology, with WN-NY99 demonstrating the closest relationship with lineage 1 WN viruses (*18*). Flavivirus sequences amplified from brain specimens from fatal human cases occurring in the New York City outbreak have been analyzed by comparing genomic sequences from the nonstructural protein genes to single isolates of KUN and WN viruses (*19*). Briese *et al.* concluded that the agent responsible for the New York City area outbreak was most closely related to KUN virus, and accordingly called the outbreak virus Kunjin/West Nile–like. The phylogenetic tree in Fig. 2 compares 40 WN and KUN viruses and is more representative of the phylogeny WN viruses.

To investigate these relationships further, we derived additional sequence data from the structural gene region of the genome (positions 549 to 1826 in the genes encoding the prM and E proteins, selected nucleotide sequences obtained during the 1999 epidemic and compared them to other WN strains within lineage 1 for which sequence data from this region were available. Table 2 displays the percent identity among these viruses. The high degree of sequence similarity (>99.4%) among the various strains circulating throughout New York City and surrounding counties and states indicates that a single WN strain was introduced and circulated during the U.S. WN virus outbreak. The identical genomic sequences identified from human brain specimens also confirm the association of this WN-NY99 virus with human disease. The small number of nucleotide substitutions observed among the strains analyzed is indicative of viral microevolution occurring during the outbreak.

A high degree of similarity between all of the U.S. WN viruses and the WN virus isolated in Israel in 1998 (>99.8%) was observed. Within these 1278 nucleotides (genome positions 549 to 1826), only two nucleotide differences occurred between WN-NY99 and WN-Israel 1998. Although this high degree of homology was unexpected, it could not have resulted from cross-contamination of U.S. viruses with the Israeli virus; the sequencing of the WN-Israel 1998 virus was performed independently at the Pasteur Institute, whereas the isolation and sequencing of the New York isolates was carried out independently at CDC. For comparison, analysis of this same region of WN-NY99 with another virus within the same lineage (Romania 1996, mosquito isolate) revealed 37 nucleotide differences (96.9% identity). The conservation of RNA supports the hypothesis that the epidemic and epizootic observed in the late summer of 1999 in the northeastern United States (primarily New York, New Jersey, and Connecticut) are attributable to a WN virus that is unprecedented and unknown in the Western Hemisphere. This virus has a widespread distribution in Africa, West Asia, and the Middle East, occasionally causing epidemics in Europe that are thought to be initiated by viruses introduced by migrant birds (*21*). The current epidemic of WN virus in New York City is unprecedented and underscores the ease with which pathogens can move among the population centers of the world. It is not yet known how the virus was introduced, nor how long it has been in the United States. The extent of its geographic distribution remains a mystery, as does the long-term impact it may have on human and animal health. The WN virus could have entered the Western Hemisphere through a number of mechanisms, including travel by infected humans, importation of illegal birds or other domestic pets, or unintentional introduction of virus-infected ticks or mosquitoes. Additional surveillance as well as field and laboratory studies are in progress to help address these questions. Because it cannot be predicted whether the WN virus will reappear in the year 2000 transmission season, all components of the public health system must be prepared with rapid surveillance and clinical detection systems in place.

Table 1. Antigenic characterization of North American WN viruses. Ig, immunoglobulin; nd, not done.

*The mAbs H5.46, 4B6C-2, 6B5A-2, 4G2, and 1B1C-4 were mouse ascitic fluids; mAbs 10A1 and 2B2 were cell culture supernatants; mAb 1B1C-4, used as a negative control antibody, is specific for the E1 glycoprotein of the alphavirus EEE. †Virus strains used: KUN, Kunjin MRM-16; Rom WN, Romania mosquito isolate 97-50; Egypt WN, Eg101; NYC WN, New York City mosquito isolate NY-99-6922; India WN, 2266; SLE, MSI-7; MVE, original; EEE, strain NJ/60. ‡Uninfected cell control.

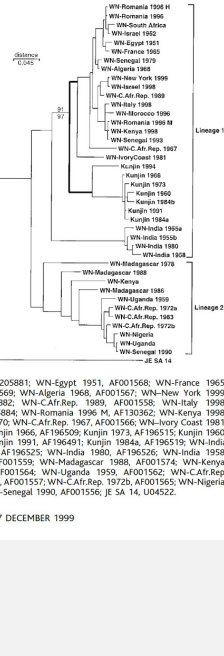

Fig. 2. Phylogenetic tree based on E-glycoprotein nucleic acid sequence data (255 base pairs). The tree was constructed with the program MEGA by neighbor-joining with Kimura two-parameter distance (scale bar). Bootstrap confidence level (500 replicates) and a confidence probability value based on the standard error test (*22*, *23*) were calculated using MEGA and are included on the tree (top and bottom values, respectively), illustrating support for the division between the lineage 1 WN virus group (not including the India isolates) and the KUN virus group. The best estimated length of the segment (bold line) separating these groups, in units of expected nucleotide substitutions per site, is 0.06928 and is statistically significantly positive (P < 0.01) by the likelihood ratio test (fastDNAml maximum likelihood program). An approximate 95% confidence interval for the true length of this segment is 0.03347, 0.10737. The isolate history of strains used in this tree and the alignment used for analysis are available upon request from the authors. GenBank accession numbers for the sequences included in the tree are as follows: WN-Romania 1996 H, AF130363; WN-Romania 1996, AF205879; WN-South Africa, AF205880; WN-Israel 1952, AF205881; WN-Egypt 1951, AF001568; WN-France 1965, AF001560; WN-Senegal 1979, AF001569; WN-Algeria 1968, AF001567; WN–New York 1999, AF196835; WN-Israel 1998, AF205882; WN-C.Afr.Rep. 1969, AF001558; WN-Italy 1998, AF205883; WN-Morocco 1996, AF205884; WN-Romania 1996 M, AF130362; WN-Kenya 1998, AF146082; WN-Senegal 1993, AF001570; WN-C.Afr.Rep. 1967, AF001566; WN–Ivory Coast 1981, AF001561; Kunjin 1994, AF196495; Kunjin 1966, AF196509; Kunjin 1973, AF196515; Kunjin 1960, D00246; Kunjin 1984b, AF196498; Kunjin 1991, AF196491; Kunjin 1984a, AF196519; WN-India 1955a, AF205885; WN-India 1955b, AF196525; WN-India 1980, AF196526; WN-India 1958, AF196524; WN-Madagascar 1978, AF001559; WN-Madagascar 1988, AF001574; WN-Kenya, AF001571; WN-Madagascar 1986, AF001564; WN-Uganda 1959, AF001562; WN-C.Afr.Rep. 1972a, AF001563; WN-C.Afr.Rep. 1983, AF001557; WN-C.Afr.Rep. 1972b, AF001565; WN-Nigeria, M12294; WN-Uganda, AF001573; WN-Senegal 1990, AF001556; JE SA 14, U04522.

*Sources of WN virus strains are as follows: WN-NY99, virus isolate from Bronx Zoo flamingo 382-99 (entire genome sequenced); WN-Crn-CT99, NVSL isolate from a sandhill crane, Fairfield County, Connecticut; WN-Crow-NJ99, American crow, Hunterdon County, New Jersey; WN-Crow-NY99, American crow, Nassau County, New York; WN-*Cpipiens*-NY99, *Culex pipiens* pool, Nassau County, New York; WN-Eq.-NY99, NVSL isolate from a horse, Suffolk County, New York; WN-HB709-NY99, human brain tissue 61709, Queens County, New York; WN-HB743-NY99, human brain tissue 61743, Queens County, New York; WN-USAMRID99, USAMRID virus isolate from a crow found in the Bronx Zoo; WN-Israel 1998, Pasteur Institute virus isolate from goose, Israel, 1998; WN-Rom.-mosq.96, virus isolate from *Culex pipiens* pool, Romania, 1996 (GenBank accession number AF130362); WN-Rom.hum.96, virus isolate from human cerebrospinal fluid, Romania, 1996 (GenBank accession number AF130363); Kunjin-MRM-16, Kunjin virus (GenBank accession number D00246); WN-Nigeria, West Nile virus (GenBank accession number M12294). Unless otherwise noted, sequencing was performed on original noncultured tissue specimens.

References and Notes

1. The following RT-PCR and sequencing protocol was used. RNA was extracted from chicken embryonic allantoic fluid with the QIAamp Viral RNA kit (Qiagen); 140 μl of starting material was extracted, according to the manufacturer's protocol, and the RNA was resuspended in a final volume of 100 μl of ribonuclease-free water. DNA templates for sequencing were then generated as follows: The entire RNA genome of WN-NY99 (lanes 382-99) was converted/copied into six overlapping double-stranded DNA fragments in multiple RT-PCR reactions using the WN-specific primer pairs 109/1442c, 1248/2737c, 2414/5237c, 5150/7990c, 7336/9794c, and 9661/10,488c (where c = complementary). The 3′ end of WN-NY99 virus was amplified by addition of a polyadenylate [poly(A)] tail onto the genome with poly(A) polymerase, followed by a RT-PCR reaction with the WN-specific primer 10,141 in combination with an oligo(dT) anchor primer. The 5′ end of WN-NY99 was amplified with the 5′ RACE System kit (Life Technologies, Gaithersburg, MD) and WN-specific primers 619c and 348c. Sequencing of additional WN isolates in the prM-E region (see text) was accomplished with the use of the primer pairs in the corresponding region of the genome, as described above. All WN-specific RT-PCR and sequencing primers were designed with the use of OLIGO (Molecular Biology Insights Inc., Cascade, CO) and the published sequences of WN (GenBank accession numbers M12294 and M10103) and Kunjin (GenBank accession number D00246). RT-PCR reactions were performed with the TITAN One Tube RT-PCR kit (Boehringer Mannheim) following the manufacturer's protocol. The resulting DNA fragments were purified by electrophoresis on 1% agarose gels; the DNA bands

In late August and early September 1999,
New York City and surrounding areas experienced
an outbreak of human encephalitis
consistent with an arboviral etiology. Serological
evidence from this outbreak implicated
a flavivirus as the etiologic agent. Concur-
rent with this human encephalitis outbreak, a
viral encephalitis of unknown etiology was
discovered in American crows (Corvus
brachyrhynchos) and fish crows (Corvus ossifragus)
dying in the same geographic area.
Deaths were also observed among several
exotic avian species, including a Chilean flamingo
(Phoenicopterus chilensis) at the
Bronx Zoo. Necropsy samples from these
birds were submitted to the National Veterinary

birds were submitted to the National Veterinary Services Laboratories, U.S. Department of Agriculture, and were inoculated into embryonated chicken eggs for virus isolation. Flavivirus-like particles (diameter 40 nm) were observed by electron microscopy in the allantoic fluid 4 days after inoculation. The isolates were forwarded to the Centers for Disease Control and Prevention (CDC) for identification.

The complete nucleotide sequence of one of these viral isolates (WN-NY99, from the dead Chilean flamingo) has now been determined. The viral genomic RNA was amplified and copied into overlapping DNA fragments of ;2 to 3 kb by means of the reverse transcription polymerase chain reaction (RTPCR) (1). Both strands of the purified DNAs were sequenced with the use of primers spaced about 400 bases apart along the entire genome. The complete 11,029-nucleotide genomic sequence of WN-NY99 has been submitted to GenBank (accession number AF196835). The deduced amino acid sequence of the coding region of WN-NY99 (genomic positions 97 to 10,395) is shown in Fig. 1. The WN-NY99 virus genome exhibited standard flavivirus genomic organization, the same overall genomic organization as was described for the WN-Nigeria and Kunjin (KUN) viruses (2). A short 59 noncoding region of 96 nucleotides is followed by an ATG initiation codon at position 97 and a single open reading frame of 10,302 nucleotides coding for three structural proteins—capsid, premembrane (prM), and envelope (E)—and five nonstructural proteins (NS1, NS2a/NS2b, NS3, NS4a/NS4b, and NS5). The coding region of WN-NY99 is followed by a 39 noncoding region of 631 nucleotides.

To identify the New York virus antigenically, we performed indirect immunofluorescence antibody tests using a panel of welldefined monoclonal antibodies (mAbs) to map various isolates from birds and mosquitoes. The mAb end-point titers with the North American isolates were compared to titers derived with other representatives of the Japanese encephalitis (JE) virus serocomplex of flaviviruses (Table 1). These mAbs, which are specific for the E-glycoprotein, can distinguish WN virus from KUN virus and can also distinguish either of these viruses from other members of the JE virus serocomplex. Viruses were grown in Vero cells, spotted onto 12-well slides, air-dried, and fixed with acetone before staining. All viruses reacted similarly with the broad flavivirus-reactive, positive-control mAb 4G2 (3, 4). None of these viruses reacted with the negative-control antibody, which is specific for the E1 glycoprotein of eastern equine encephalitis (EEE), an unrelated alphavirus (5). All WN isolates, including those from North America, reacted specifically with the WN virus–specific mAb H5.46, but not with the KUN virus–specific mAb 10A1 (four- to eightfold titer differences) (6–8). Similarly, only KUN virus reacted with mAb 10A1, but not with mAb H5.46. No KUN or WN viruses reacted with either the St. Louis encephalitis (SLE) virus–specific mAb 6B5A-2 or the Murray Valley encephalitis (MVE) virus–specific mAb 4B6C-2 (9, 10). These results type the North American isolates as WN virus and not as KUN, SLE, or MVE viruses.

WN virus belongs to the family Flaviviridae, genus Flavivirus, and is a member of the JE virus serocomplex, which also includes JE, SLE, MVE, and KUN viruses, among others (11). Flaviviruses are plus-sense, single-stranded RNA viruses with a genome of ;11,000 nucleotides (2). Recently published

sequence and phylogenetic data suggest that, within this serocomplex, KUN viruses appear to be a subtype of WN virus rather than a separate viral species (12). Although flaviviruses are closely related to each other antigenically and cross-react in serological tests with polyclonal antisera, most have a rather distinctive geographic distribution. Those of the JE serocomplex are maintained in a natural transmission cycle involving mosquito vectors and bird reservoir hosts. Humans and horses are usually incidental hosts.

To determine more precisely the relationships between the WN-NY99 virus and other related virus strains, we performed a phylogenetic analysis on an informative region of the E-glycoprotein gene (genome positions 1402 to 1656) (12, 13). Aligned nucleic acid sequence data from 33 WN viruses, seven KUN viruses, and one JE virus were analyzed with the use of algorithms for parsimony (PAUP), distance (MEGA; Fig. 2), and maximum likelihood (fastDNAml) (14–17). The phylogenetic trees generated by these analyses had the same overall topology as that previously observed, insofar as all WN and KUN viruses are separated into two major lineages (12, 13). Viruses in lineage 1 are primarily of West African, Middle Eastern, Eastern European, and Australian origin. Lineage 2 consists exclusively of viruses from the African continent that have apparently not been involved in human or equine outbreaks, but rather are maintained in enzootic cycles. Within lineage 1, the KUN viruses and the Indian WN viruses both appear as monophyletic sister clades to the European and African WN viruses. The WN-NY99 virus is found within lineage 1 and is most closely related to WN viruses that have recently been isolated from North Africa, Romania, Kenya, Italy, and the Middle East. Of particular note is the close relationship between the WN-NY99 virus and a WN virus isolated from the brain of a dead goose in Israel in 1998. Phylogenetic analysis of a portion of the gene encoding the NS5 protein and of the 39 noncoding region (830 bases) of 12 WN and KUN viruses also generates trees with nearly identical topology, with WN-NY99 demonstrating the closest relationship with lineage 1 WN viruses (18). Flavivirus sequences amplified from brain specimens from fatal human cases occurring in the New York City outbreak have been analyzed by comparing genomic sequences from the nonstructural protein genes to single strains of KUN and WN viruses (19). Briese et al. concluded that the agent responsible for the New York City area outbreak was most closely related to KUN virus, and accordingly called the outbreak virus Kunjin/West Nile–like. The phylogenetic tree in Fig. 2 compares 40 WN and KUN viruses and is more representative of the phylogeny among WN viruses.

To investigate these relationships further, we derived additional sequence data from the structural gene region of the genome (positions 549 to 1826 in the genes encoding the prM and E proteins) from selected isolates obtained during the 1999 epidemic and compared them to other WN strains within lineage 1 for which sequence data from this region were available. Table 2 displays the percent identity among these viruses. The high degree of sequence similarity (.99.8%) among the various strains circulating throughout New York City and surrounding counties and states indicates that a single WN strain was introduced and circulated during the U.S. WN virus outbreak. The identical genomic sequences identified from human

brain specimens also confirm the association of this WN-NY99 virus with human disease. The small number of nucleotide substitutions observed among the strains analyzed is indicative of viral microevolution occurring during the outbreak.

A high degree of similarity between all of the U.S. WN viruses and the WN virus isolated in Israel in 1998 (.99.8%) was observed. Within these 1278 nucleotides (genome positions 549 to 1826), only two nucleotide differences occurred between WN-NY99 and WNIsrael 1998. Although this high degree of homology was unexpected, it could not have resulted from cross-contamination of U.S. viruses with the Israeli virus; the sequencing of the WN-Israel 1998 virus was performed independently at the Pasteur Institute, whereas the isolation and sequencing of New York isolates was carried out independently at CDC. For comparison, analysis of this same region of WN-NY99 with another virus within the same lineage (Romania 1996, mosquito isolate) revealed 37 nucleotide differences (96.9% identity).

The cumulative data support the hypothesis that the epidemic and epizootic observed in the late summer of 1999 in the northeastern United States (primarily New York, New Jersey, and Connecticut) are attributable to a WN virus that has been circulating in the Mediterranean region since 1998. It is noteworthy that the WN-Israel 1998 virus was associated with increased pathogenicity for birds, a property also observed in the U.S. outbreak and previously observed only experimentally (20). The absence of reported human cases during this Israeli epizootic may be due to background human immunity to the WN virus in Israel.

The northeastern U.S. outbreak is the first documented incidence of the WN virus in the Western Hemisphere. This virus has a widespread distribution in Africa, West Asia, and the Middle East, occasionally causing epidemics in Europe that are thought to be initiated by viruses introduced by migrant birds (21). The current epidemic of WN virus in New York City is unprecedented and underscores the ease with which pathogens can move among the population centers of the world. It is not yet known how the virus was introduced, nor how long it has been in the United States. The extent of its geographic distribution remains a mystery, as does the long-term impact it may have on human and animal health. The WN virus could have entered the Western Hemisphere through a number of mechanisms, including travel by infected humans, importation of illegal birds or other domestic pets, or unintentional introduction of virus-infected ticks or mosquitoes. Additional surveillance as well as field and laboratory studies are in progress to help address these questions. Because it cannot be predicted whether the WN virus will reappear in the year 2000 transmission season, all components of the public health system must be prepared with rapid surveillance and clinical detection systems in place.

Description

New biochemical tools have made it possible to change the DNA sequences of living organisms with unprecedented ease and precision. These new tools have generated great excitement in the scientific and medical communities because of their potential to advance biological understanding, alter the genomes of microbes, plants, and animals, and treat human diseases. They also have raised profound questions about how people may choose to alter not only their own DNA but the genomes of future generations.

Columbia University College of Physicians and Surgeons, M.D.

Occupation

Physician, pathologist

William Henry Welch (April 8, 1850 – April 30, 1934) was an American physician, pathologist, bacteriologist, and medical school administrator. He was one of the "Big Four" founding professors at the Johns Hopkins Hospital.[1] He was the first dean of the Johns Hopkins School of Medicine and was also the founder of the Johns Hopkins School of Hygiene and Public Health, the first school of public health in the country. Welch was more known for his cogent summations of current scientific work, than his own scientific research. The Johns Hopkins medical school library is also named after Welch. In his lifetime, he was called the "Dean of American Medicine" and received various awards and honors throughout his lifetime, and posthumously.[2]

Biography[edit]

Early life[edit]

He was born on April 8, 1850, to William Wickham Welch and Emeline Collin Welch in Norfolk, Connecticut. He had a long family history of physicians and surgeons, starting with his grandfather Benjamin Welch. Benjamin was also on the medical forefront of his time, establishing his county's medical association.[3] William H. Welch was educated at Norfolk Academy and the Winchester Institute, a boarding school. His father and a grandfather and four of his uncles were all physicians. William Henry entered Yale University in 1866, where he studied Greek and classics. Initially, Welch was not interested in becoming a physician; his primary ambition was to teach the Greek language.[4] He received an A.B. degree in 1870. As an undergraduate, he joined the Skull and Bones fraternity.[5]

Early career[edit]

After a short period of teaching high-school students in Norwich, New York, Welch went to study medicine at the Columbia University College of Physicians and Surgeons, in Manhattan. In 1875, he received his MD. From 1876 to 1877, he studied at several German laboratories to work with, among others, Julius Cohnheim and Rudolf Virchow. This experience abroad prompted Welch to model his plans for a new medical institute on the Institute of the History of Medicine at the University of Leipzig.[4] He returned to America in 1877 and opened a lab at Bellevue Medical College (now a part of New York University Medical School).

Later career at Johns Hopkins[edit]

Welch is widely known at the time for his pathology residency program, which later attracted many bright minds from across the country.

In 1884, he was the first physician recruited to be a professor at the newly forming Johns Hopkins Hospital and Medical School at Johns Hopkins University in Baltimore.[1] By 1886, he had 16 graduate physicians working in his laboratory – the first postgraduate training program for physicians in the country.[1] He helped the trustees recruit the other founding physicians for the hospital – William Stewart Halsted, William Osler, and Howard Kelly. Welch became head of the Department of Pathology when the hospital opened in 1889. In 1893, he also became the first dean of the Johns Hopkins University School of Medicine, and in 1916, he established and led the Johns Hopkins School of Hygiene and Public Health, the first school of public health in the country. During this time, Welch was also involved in creating a new medical library for Johns Hopkins. He embarked on a sabbatical in Europe, where he visited the University of Leipzig's Institute and various other universities, as well as libraries and bookstores. These German institutions influenced Welch's design for the Institute of the History of Medicine at Johns Hopkins, which was established in October 1929.[6] The new institute also built on the already existing Johns Hopkins Hospital Historical Club (est. 1890), of which Welch had been a co-founder.[7] Welch is also the founding editor-in-chief of the American Journal of Epidemiology.

Caricature of William Welch with his students, by Max Brödel, 1910

Graduates of Welch's training programs were highly coveted as academic physicians. Medical schools and institutes across the country vied for Welch's former students and graduate scientists to fill top posts.[1] Many of his residents went on to become highly prominent physicians, including Walter Reed, co-discoverer of the cause of yellow fever, [**Dr. Simon Flexner (born 1863)**], founding director of the Rockefeller Institute for Medical Research, and future Nobel laureates George Whipple and Peyton Rous.

Welch's research was principally in bacteriology, and he is the discoverer of the organism that causes gas gangrene. It was named Clostridium welchii in recognition of that fact, but now the organism usually is designated as Clostridium perfringens.

From 1901 to 1933, he was founding president of the Board of Scientific Directors at the Rockefeller Institute for Medical Research. He was an instrumental reformer of medical education in the United States as well as a president of the National Academy of Sciences from 1913–1917. He also was president of the American Medical Association, the Association of American Physicians, the History of Science Society, the Congress of American Physicians and Surgeons, the Society of American Bacteriologists, and the Maryland State Board of Health. Welch was a founding editor of the Journal of Experimental Medicine.

Welch served in the U.S. Army Medical Corps during World War I, and played a major role in the response to the 1918 Influenza Pandemic. He remained in the Reserve Corps for three years thereafter, attaining the rank of brigadier general (07). For his service during the war, Welch received the Distinguished Service Medal.[8]

Death[edit]

Welch died on April 30, 1934, at the age of 84, of prostatic adenocarcinoma at Johns Hopkins Hospital.[2]

Honors and awards[edit]

- Welch was awarded the Royal Order of the Crown of Prussia in 1911.[4]
- In 1927, Welch received the Kober Medal from the American Association of Physicians.[4]
- The William H. Welch Medical Library at Johns Hopkins, which opened in 1929, was decided on March 5, 1928, to be named after him.[9]
- In 1931, Welch received the Harben Medal from the Royal Institute of Public Health for his professorship in the history of medicine.[4]
- In 1950, the first William H. Welch Medal was awarded by American Association for the History of Medicine to honor authors in field of medical history [10]
- Welch Road, in the vicinity of Stanford University Medical Center in Stanford, California, is named in his honor.[11]

CDC sees no evidence of bioterrorism in spread of West Nile virus

Filed Under: **Anthrax**; **Bioterrorism**; **West Nile**

Sep 19, 2002 (CIDRAP News) – In response to a US senator's speculation, the Centers for Disease Control and Prevention (CDC) says there is no evidence that bioterrorism has played a role in the spread of West Nile virus to and within the United States.

"As stated repeatedly, we have no scientific evidence to suggest that West Nile virus and West Nile activity in the United States is an act of terrorism or bioterrorism-related," Bernadette Burden, a CDC spokeswoman in Atlanta, told CIDRAP News yesterday.

Last week Sen. Patrick J. Leahy, D-Vt., whose office was the target of an anthrax-laden letter last fall, speculated on a radio talk show about the possibility that the West Nile epidemic is related to bioterrorism. The disease reached the United States in 1999 and spread rapidly across the country this summer. As of Sep 18, the CDC reported 1,641 confirmed cases in 32 states, with 80 deaths.

"I think we have to ask ourselves: Is it coincidence that we're seeing such an increase in West Nile virus, or is that something that's being tested as a biological weapon against us?," Leahy said on a Sep 12 talk show, as quoted by the Associated Press. The show reportedly was aired by WKDR in Burlington, Vt., and WDEV in Waterbury, Vt.

In a written statement released later the same day, Leahy said, "In the times in which we live, questions about our vulnerabilities are unavoidable, and finding all the answers we can is more important than ever. I have no way of knowing what the answers are, but some legitimate questions have been asked, especially before September 11 last year, and no doubt they are being asked anew by the agencies that are working on this."

Blythe McCormack, a Leahy spokeswoman in Washington, said Leahy was not calling for a new investigation of the issue. "It was basically along the lines of, 'We should be looking into every possibility, especially in the environment after September 11,'" she told CIDRAP News. She also said the talk show was cut short so that the station could broadcast President Bush's speech to the United Nations, so Leahy's comments were "kind of incomplete to begin with."

In subsequent news reports, CDC officials said the spread of West Nile in the United States has been consistent with what is known about its natural transmission pathway from mosquitoes to birds and people.

Burden said the CDC considered the bioterrorism possibility when West Nile first reached the East Coast in 1999, killing seven people in the New York City area. "The CDC considers any and all possibilities for a virus coming into the United States for the first time, so certainly the issue of it being planted deliberately was a question that was examined at the time," she said.

In October 1999, the *New Yorker* magazine published an article describing claims by an alleged Iraqi defector that Saddam Hussein was planning to use West Nile virus as a weapon. The article, by Richard Preston, said bioweapons experts at the CIA had heard of the claim made in a book by the alleged defector, who called himself Mikhael Ramadan, and they recalled the claim when West Nile virus was identified in New York City in September 1999. Ramadan's book, as quoted in Preston's article, said Hussein had boasted that his scientists would develop a strain of West Nile virus "capable of destroying 97 percent of all life in an urban environment." (The fatality rate for West Nile is far below 97%.)

Preston's article also quoted an unnamed Army expert as saying that Soviet Russian biologists had evaluated West Nile as a possible biological weapon but concluded that it wouldn't work very well.

After the *New Yorker* article appeared, the CIA said it had looked into the possibility that Saddam Hussein had engineered the West Nile outbreak and had concluded there was no evidence. Leahy's office supplied a copy of a *Washington Post* article published Oct 12, 1999, in which an unnamed CIA official said the agency had found no evidence of bioterrorism. CIA officials said the agency had reviewed press reports on the matter but had not conducted a formal investigation, according to the article.

One Congressional committee also looked into the issue in July 2000 and likewise saw no evidence of terrorism behind the West Nile outbreak. The report, by the minority staff of the Senate Governmental Affairs Committee, stated, "U.S. law enforcement, public health, and intelligence officials have investigated the possibility that West Nile virus resulted from a bioterrorist attack but believe that this is very unlikely. All indications point to the natural occurrence of West Nile virus, which probably arrived in New York through international trade and travel."

Iraq got seeds for bioweapons from U.S.

Rep. Jim McDermott, a Washington Democrat, and other members of a visiting American delegation in Baghdad, Iraq, on Sept. 30. The visiting lawmakers warned both Baghdad and Washington not to interfere in the U.N. weapons inspection process. (AP/Jassim Mohammed)
WASHINGTON - Iraq's bioweapons program that President Bush wants to eradicate got its start with help from the United States two decades ago, according to government records getting new scrutiny in light of the discussion of war against Iraq.

The Centers for Disease Control and Prevention sent samples directly to several Iraqi sites that United Nations weapons inspectors determined were part of Saddam Hussein's biological weapons program, CDC and congressional records from the early 1990s show.

Iraq had ordered the samples, claiming it needed them for legitimate medical research.

The CDC and a biological sample company, American Type Culture Collection, sent strains of all the germs Iraq used to make weapons, including anthrax, the bacteria that make botulinum toxin and the germs that cause gas gangrene, the records show. Iraq also got samples of other deadly pathogens, including West Nile virus.

The transfers came in the 1980s, when the United States supported Iraq in its war with Iran. They were detailed in a 1994 Senate Banking Committee report and a 1995 follow-up letter from the CDC to the Senate.

The exports were legal at the time and approved under a program administered by the Commerce Department.

"I don't think it would be accurate to say the United States government deliberately provided seed stocks to the Iraqis' biological weapons programs," said Jonathan Tucker, a former U.N. biological weapons inspector. "But they did deliver samples that Iraq said had a legitimate public health purpose, which I think was naive to believe, even at the time."

The disclosures put the United States in the uncomfortable position of possibly having provided the key ingredients of the weapons America is considering waging war to destroy, said Sen. Robert C. Byrd.

The West Virginia Democrat entered the documents into the Congressional Record this month.

Byrd asked Defense Secretary Donald H. Rumsfeld about the germ transfers at a recent Senate Armed Services Committee hearing. Byrd noted that Rumsfeld met Hussein in 1983, when Rumsfeld was President Reagan's Middle East envoy.

"Are we, in fact, now facing the possibility of reaping what we have sown?" Byrd asked Rumsfeld after reading parts of a Newsweek article on the transfers.

"I have never heard anything like what you've read, I have no knowledge of it whatsoever, and I doubt it," Rumsfeld said.

He later said he would ask the Defense Department and other government agencies to search their records for evidence of the transfers.

Invoices included in the documents read like shopping lists for biological weapons programs.

One 1986 shipment from the Virginia-based American Type Culture Collection included three strains of anthrax, six strains of the bacteria that make botulinum toxin and three strains of the bacteria that cause gas gangrene.

Iraq later admitted to the United Nations that it had made weapons out of all three.

The company sent the bacteria to the University of Baghdad, which U.N. inspectors concluded had been used as a front to acquire samples for Iraq's biological weapons program.

The CDC, meanwhile, sent shipments of germs to the Iraqi Atomic Energy Commission and other agencies involved in Iraq's weapons of mass destruction programs.

It sent samples in 1986 of botulinum toxin and botulinum toxoid - used to make vaccines against botulinum toxin - directly to the Iraqi chemical and biological weapons complex at al-Muthanna, the records show.

Botulinum toxin is the paralyzing poison that causes botulism. Having a vaccine to the toxin would be useful for anyone working with it, such as biological weapons researchers or soldiers who might be exposed to the deadly poison, Tucker said.

The CDC also sent samples of a strain of West Nile virus to an Iraqi microbiologist at a university in the southern city of Basra in 1985, the records show.

USGS map of the United States showing reported cases of West Nile virus infection by county in 2012. Cumulative total of the entire country: 1,590 cases. (Current as of Aug. 28, 2012).[1]

U.S. West Nile virus (WNV) neuroinvasive disease incidence. Current 9-4-2012

The West Nile virus quickly spread across the United States after the first reported cases in Queens, New York in 1999. The virus is believed to have entered in an infected bird or mosquito, although there is no clear evidence. The disease spread quickly through infected birds. Mosquitoes spread the disease to mammals. It was mainly noted in horses but also appeared in a number of other species. **The first human cases usually followed within three months of the first appearance of infected birds in the area except where cold weather interrupted the mosquito vectors.** Since the virus has become widely established in the U.S., an average of 130 deaths a year occurred.

Differences in surveillance and reporting between health departments and generally increased surveillance as the disease spread cause some problems in direct comparison of the number of cases and the mortality rate. The reported number of infected in 2009 was 720, but the estimated total number of infected the same year was 54,000.[2] The true mortality rate is thought to be much lower because most cases are so mild they go undiagnosed. Some estimates put severe cases at only 1% of all cases. It is believed that the elderly or people with weak immune systems are most vulnerable to serious illness or death if bitten by a mosquito infected by West Nile.[3][unreliable medical source?] Most but not all mild cases go undiagnosed. In addition, some more severe but non-neuroinvasive cases are not reported to the CDC. Some mild cases are discovered during blood donation screening. 1,039 West Nile-tainted blood donations were discovered between 2003 and mid-2005. 30 cases of West Nile from blood transfusion were known, the majority from 2002 before blood screening was instituted.

In the first ten years since the virus arrived in the U.S., over 1,100 deaths occurred with human cases reported from every U.S. state except Maine, Alaska and Hawaii. (Animal cases have been occasionally found in Maine and in Puerto Rico.)[4] In 2012, there was a widespread outbreak with the highest death toll and second-highest total case numbers. Maine and Puerto Rico reported one case each, the first time the disease was reported in those places.[5]

Discovery in the United States

In August 1999, Dr. Deborah Asnis, an infectious disease specialist at Flushing Hospital Medical Center in Queens, noticed two male patients who were suffering from similar, unusual symptoms. The two patients, aged 60 and 75 respectively, were exhibiting sudden paralysis in their arms and legs, as well as disorientation and high fevers.[6][7] Lab testing also showed elevated numbers of white blood cellswithin the spinal fluid of both males.[6] Neither of the patients were responding to antiviral drugs.[7] Possible early hypothesizes included botulism, viral encephalitis, Guillain–Barré syndrome, or meningitis, but none of these illnesses exactly matched the symptoms.[6] Asnis decided to pursue a more concrete diagnosis by contacting authorities and other colleagues.[6]

[**Deborah Susan Asnis (born 1956)**] contacted [**Dr. Marcelle C. Layton (born 1958)**], the New York City Department of Health's chief epidemiologist, on Monday, August 23, 1999, to report her patients' symptoms.[6] Layton advised Asnis to send samples of the patients' blood and spinal fluid to the New York

State Department of Health in Albany for further analysis.[5] By Friday, August 27, 1999, just four days after Asnis had contacted Layton, two additional patients had been identified in Queens.[6] The number rose to eight by Sunday, August 29, at Flushing Hospital Medical Center and other hospitals in Queens.[6] All of the early patients resided within a few miles of one another. They were also frequent gardeners in the evenings.[6]

The Centers for Disease Control and Prevention (C.D.C.) initially identified the mystery illness as St. Louis encephalitis on September 3, 1999.[6] The city of New York began widespread spraying for mosquitos later that same day.[6] However, laboratory testing continued to determine a definitive cause of the symptoms.

The U.S. federal government revised its diagnosis from St. Louis encephalitis to West Nile virus on September 27, 1999, citing research by [**Dr. Duane J. Gubler (born 1939)**], a C.D.C. expert on arboviruses, as well as several bird deaths in the Bronx, located to the north of Queens.[6]

Dr. Deborah Asnis was credited by health experts with the early identification of West Nile virus in the United States.[6] **Her actions likely prevented a more widespread outbreak.**[6][7] In their 2003 book, The New Killer Diseases: How the Alarming Evolution of Germs Threatens Us All, authors Elinor Levy and Mark Fischetti praised Dr. Asnis' response to the symptoms, writing that, "Asnis did something other doctors might not have bothered to do."[6] They elaborated that, "One of the worst problems with our disease-detection system is that many doctors never report cases of strange symptoms, either because they are unsure of the disease they are facing, they're ignorant of the reporting requirement, or they simply never get around to it. Deborah Asnis was highly conscientious."[6]

Recent cases

During the years between 1999 and 2010, an estimate of 3 million people have been infected in the United States. Highest incidence rates are observed in states of the central great plains, with South Dakota, Wyoming and North Dakota leading in incidence.[8]

During the 2012 West Nile virus outbreak in Texas, 1,868 cases were reported. Male patients, persons >65 years of age, and minorities were at highest risk for neuroinvasive disease. At total of 1,868 cases including 844 (45%) WNND (West Nile neuroinvasive disease) cases and 89 deaths (case-fatality rate 5%). Dates of onset ranged from May 1, 2012, through December 6, 2012. The outbreak peaked during week 33 (mid-August) with 225 reported cases, which is historically the same peak for all reported WNV cases in Texas during 2002–2011. The median time from date of symptom onset to date of official report to TxDSHS was 27 days (range 6–274 days). Of the 254 counties in Texas, 135 (53%) reported a WNV case. The overall incidence rate for the state was 7.8 cases per 100,000 population. Almost half of the cases were reported from the northeastern quadrant of the state, including the Dallas/Fort Worth metroplex (902 [48%] cases): Dallas (396 [21%]), Tarrant (259 [14%]), Collin (64 [3%]), and Denton (183 [10%]) counties. These 4 counties had a combined incidence rate of 16 cases per 100,000 population.[9]

Cases

[...]

Sources: Final Cumulative Maps & Data for 1999–2018, Preliminary Maps & Data for 2019, and West Nile Virus Disease Cases by State 2020, Centers for Disease Control and Prevention

*2019 also had 104 presumptive cases observed in blood donors

** as of December 15, 2020, also 127 presumptive cases observed in blood donors

Maps of progression

The following maps show the progress of human cases of West Nile across the United States. States are colored according to the percentage of all U.S. West Nile cases they represented in that year. Zero percent (no cases) is colored white; less than 1% is blue; between 1% and 5% is green; between 5% and 10% is yellow, and greater than 10% of cases in a year is red.

west nile and birds

https://www.naba.org/wnvirus.html

Finally, emphasis has focused on dead birds, particularly dead crows. Crows are among the most susceptible species to West Nile Virus in the Old World and are obviously going to be a major reservoir for the virus in the New World. The fact that West Nile Virus does not usually kill the birds that carry it is one piece of evidence supporting the hypothesis that it recently arrived in North America, where our crows and other birds have yet to develop any immunity. However, in order for the disease to be sufficiently widespread in the birds to cause a number of bird deaths, and in order for there to be enough infected birds to infect enough mosquitoes to produce an epidemic, the virus had to be present in the bird population for many months, perhaps even for years. In southern Europe the virus was present for several years before the Romanian outbreak.

This means that the virus is probably already fairly widespread in birds, not just in crows. Birds, including crows, range widely and are not cognizant of county barriers. Thus a bird that dies in county A today may have been infected in county B last week. Thus, to base county-wide control programs on a single dead crow is inappropriate.

CDC

https://wwwnc.cdc.gov/eid/article/9/3/02-0628_article

Of the 87 mosquito-exposed birds, we observed obvious signs of illness in 28 birds, including members of certain passerine species (in particular, the corvids) and the Ring-billed Gull. Signs of illness included generalized lethargy, ruffled feathers, unusual posture (Blue Jay), inability to hold head upright (Ring-billed Gull), and ataxia (Ring-billed Gull). In most cases, clinical signs were followed by death within 24 h. Moribund birds were euthanized, although ill birds were rarely found moribund because death occurred rapidly. External hemorrhage, either from the mouth or from the cloaca, was noted in a small number of American Crows that died. Although our sample sizes and controls were insufficient to generate accurate estimates of mortality rates, our observations can be used to generate preliminary estimates (Table 4).

https://www.reuters.com/article/us-westnile-birds/west-nile-killing-off-beloved-u-s-birds-study-idUSN1735085420070518

CHICAGO (Reuters) - The West Nile Virus is taking a worse-than-expected toll on some favorite birds in North America such as robins and chickadees, U.S. researchers said on Thursday.

Slideshow (3 images)

They studied 20 North American birds and found declines in seven species from four families as a result of the virus, which lives in birds and other animals and can be transmitted by mosquitoes to humans.

The impact was especially strong among the American crow population, which has been cut by 45 percent since West Nile first appeared in the United States in 1999.

“Seven out of 20 is a substantial number,” said A. Marm Kilpatrick, senior research scientist for the Consortium for Conservation Medicine at the Wildlife Trust, whose work appears in journal Nature this week.

“When West Nile first showed up in ‘99, people knew that crows were dying and jays were dying, but no one knew if there were any population level impacts,” Kilpatrick said in a telephone interview.

2011 Book : "West Nile Story - in the Run-Up to 9/11" by Mitchel Cohen

Published by the No Spray Coalition Against Toxic Pesticides / Source : [HB005W][GDrive]

See **Dr. Thomas Patrick Monath (born 1940)**

It was in this context that in August 1999, animal pathologist
Tracey McNamara and her team working at the Bronx Zoo disclosed
that exotic birds had begun dying from an unknown disease.
They feared it would spread to other birds and might attack
human beings and present a serious health emergency. McNamara
– who had also been associated with the top security U.S. government
animal disease and biowarfare research lab on Plum Island
(off the eastern tip of Long Island, New York) – contacted the
NYC Department of Health. After a number of false starts in identifying
the pathogen, which by now had affected several people as
well as birds, the Centers for Disease Control announced that a
rare mosquito-borne virus, West Nile, was causing the disease
previously unknown in the U.S.3

[...]
wo years before what we now know simply as “9/11,” a
terrorist attack hit New York – or so we were told. U.S.
government officials announced that Saddam Hussein had
sent some arcane virus that was killing birds – mostly crows – and
that could be transmitted to people by mosquitoes. Panic ensued.
The mysterious disease threatened to infect and kill people
throughout the metropolitan area.
T
Ecologists and bird-watchers had tried to call attention to
clusters of dead crows for months earlier in 1999, mostly around
the Fort Totten area. Fort Totten is situated on the northern shore
of Queens, some 200 miles as the crow flies from the Plum Island
Animal Disease Center – a high security government lab research-
7
Drawing by Van Howell
for the No Spray Coalition
ing dangerous pathogens similar to West Nile virus.
The infected areas also overlapped the path of emissions
spewing from New Jersey’s oil refineries, raising questions for

some (but ignored by most in the NYC Department of Health) over the possibility of air pollution as the cause of – or at least a contributing factor in – the bird deaths.5 Health and government officials released incorrect and ever-changing information about the nature of the disease, which fueled panic. At first the birds were said to have died from St. Louis Encephalitis, then West Nile-'like' virus, and finally West Nile virus.

Four people in New York City died from what was said to be West Nile encephalitis that first year, a disease previously unknown in the U.S. (Encephalitis is an inflammation of the brain that could be caused by exposure to pesticides and other toxins as well as by certain viruses and bacteria.) Far fewer died in this "emergency" than from diseases caused or exacerbated by the massive aerial and truck-based pesticide spraying. Strangely – and this information had to be pried a year later from Dept. of Health officials with a crowbar – not a trace of West Nile virus was found in the brain tissue of those who'd died, even though studies at Yale showed that "people who develop full-blown cases of West Nile encephalitis . . . are those in whom the virus has penetrated the blood-brain barrier." The virus should have been found in the brain of anyone suffering or having died from West Nile.6

Sound, and into the Atlantic Ocean.

Mayor Giuliani held daily press conferences at his bunker in World Trade Center #7 surrounded by maps and graphs and armed guards, whipping up hysteria and enabling officials to circumvent civil liberties and manipulate the media and public. This was a building which, unknown to most of us at the time, also

9

housed, a few floors above, the largest CIA offices in the country outside of Langley VA, and all the Securities and Exchange Commission files on Enron and other corporate scandals, which were scheduled to be heard shortly after 9/11. (Most of those files were destroyed in the attacks on the World Trade Center.) In the beginning Giuliani and others pinned the upsurge of mosquito-borne ailments and the handful of cases of West Nile encephalitis on Saddam Hussein, just as officials were later to claim – similarly, with nary a shred of evidence – that Saddam was behind the Anthrax attacks following 9/11. During the military build-up to the Gulf War in 1990-91, then-President George Bush publicly condemned the threatened use of chemical and biological weapons by Saddam Hussein, who was depicted as "worse than Hitler," while privately shipping those very pathogens to Iraq. The U.S. military, under the guise of fearing an Iraqi attack with biological and chemical weapons, inoculated hundreds of thousands of U.S. soldiers with experimental anthrax and nerve gas vaccines that had

10

Donald Rumsfeld's famous handshake cementing trade agreements with Saddam Hussein in Iraq, circa 1983.

never before been tested on people in field conditions. Hundreds resisted, and many were quietly court-martialed.

The U.S. government knew the extent of Iraq's biological and chemical arsenal. After all, hadn't Donald Rumsfeld visited Iraq in 1983 on behalf of the Bechtel corporation, which was seeking to build an oil pipeline from Iraq to the Gulf of Aqaba via Jordan, and shaken Saddam's hand to seal the various trade agreements between the U.S. and Iraq? But

[...]

The U.S. government knew the extent of Iraq's biological and chemical arsenal. After all, hadn't Donald Rumsfeld visited Iraq in 1983 on behalf of the Bechtel corporation, which was seeking to build an oil pipeline from Iraq to the Gulf of Aqaba via Jordan, and shaken Saddam's hand to seal the various trade agreements between the U.S. and Iraq? But now, in reckless disregard of the truth (and of their own culpability in providing pathogens to Saddam), U.S. and city officials speculated – this was in September 1999, two years before 9/11, remember – that Iraq manufactured the virus said to be causing the disease, infected mosquitoes with it, and then shipped those mosquitoes overseas to be released in New York City. This scenario surely strained credulity, especially since the signature of U.S. President George Herbert Walker Bush, in his capacity as head of the CIA and later as Vice President and President, appeared on documents approving U.S. shipments to Iraq of toxic varieties of E.coli and Salmonella bacteria, and organisms that cause Anthrax, West Nile, gas gangrene and brucellosis.

11 But somehow the obvious "follow up" questions were never asked, and Bush and Donald Rumsfeld escaped criticism over their sale of toxic organisms to Iraq.

ambiguous.)

THE INSTRUCTIVE CASE OF DR. OMAR SHAFEY
r. Marcelle Layton contributed to the pesticide drumbeat
with an article on the spray campaign in the CDC's journal,
Morbidty and Mortality Weekly Report. But even here,
in the supposedly objective halls of science, political intrigue
abounds: Layton's report was chosen at the last-minute to replace
a very critical article about spraying Malathion by Florida epidemiologist
Dr. Omar Shafey, who headed the Florida Department
of Health's Division of Environmental Hazards and Health
D
25
Effects. Shafey submitted a study, "Surveillance for Acute Pesticide-
Related Illness During the Medfly Eradication Program –
Florida, 1998," which detailed 138 reported cases of pesticide-related
illnesses among Florida residents following intensive Malathion
spraying there.
Dr. Shafey's findings were slated to appear in the October 22,
1999 issue of MMWR. But on October 19 – two days before publication
– Dr. Steven Ostroff, then Acting Deputy Director for Science
and Public Health at the CDC, called John Ward, M.D., the

of spraying and replace it with Layton's. It

[..]
Dr. Shafey continued his research on workers exposed to
pesticides on the job. But two years later, he was fired by the Florida
Department of Health for an alleged over-charge of $12.50 on a
travel-reimbursement voucher. (The inspector

[...]
company announced it was
32
"almost ready" in developing a vaccine for West Nile encephalitis
– at just the moment (Oh Lucky Day!) the disease was first detected
in birds at the Bronx Zoo and as Hauer and Giuliani were
about to begin their mass spray campaign. (Oravax was awarded
a $3 million grant from the National Institutes of Health the following
summer to create a live viral vaccine for West Nile, using
the yellow fever vaccine as its base.) Oravax, according to Monath,
was also working on Dengue fever at the time that Cuba complained
that the U.S. was engaging in bioterrorism against it by
spreading mosquito-borne illnesses there. A mysterious outbreak
of Dengue fever also hit Hawaii at that time.
Some have suspected that the discovery of West Nile disease
and the readiness of the vaccine were not a coincidence, that political
and economic motives intersected and reinforced each other,
and that West Nile virus was released to create a market for the
vaccine as well as to engage in bioterrorism preparedness drills
and experiments. "The theory I and a number of other activists
have been suggesting," writes researcher Patricia Doyle, "is that
the entire WNV panic has been created specifically in order to justify
the mass distribution of this very vaccine throughout the entire
U.S. Oravax was granted a license by the U.S. Army bio-warfare
lab in Ft. Detrick in 1996 (Monath was previously a researcher at
the same lab) to manufacture a Japanese encephalitis vaccine derived
from a genetically-altered virus the Army itself created.
WNV is a variation of Japanese encephalitis. Numerous medical
and scientific institutions, many run by the Federal government,
have been quietly experimenting with WNV in NYC and the surrounding
area for decades. Most of this research involved biowarfare
applications."49
It was Hauer who, more than anyone else, persisted in raising
the "foreign terrorism" conjecture for West Nile virus (claiming
that Saddam Hussein was behind it) long after that disinformation
and attempt at public manipulation had been discredited, and
left it to Monath to push for financial subsidies to his company to
manufacture the vaccine. Hauer was next hired as Assistant Secre-
33
tary of Health and Human Services on – please note the date –
Sept. 10th, 2001. Together with Tommy Thompson (the secretary of
the agency), it was Hauer who told the White House staff and
President Bush to begin taking the drug Cipro, made by Bayer, ostensibly
for Anthrax exposure.50 The date of that recommendation?
The morning of September 11th, 2001.
Hauer then went on to head the federal Office of Public
Health Emergency Preparedness,51 created in June 2002. He used
his position as a bully pulpit to stump for emergency mandatory
vaccination programs and hammer them into place. He was the
main force behind legislation known as the Model Emergency
Health Powers Act, which establishes a bioterror preparedness
"czar" – Hauer clearly envisioned himself in that role – with authority
to order mandatory vaccinations of health care workers
and first responders (police, fire-fighters, soldiers, medical personnel)

and "quarantine" facilities for those who fall victim to smallpox or other "emergency" diseases, as well as to keep track of and round up those who refuse to take the smallpox vaccine and incarcerate them in the same facilities as people who contracted the highly contagious smallpox. The legislation has been submitted federally as well as to state legislatures across the country, where much of it has already been passed piece by piece. By 2009, the camps had already been constructed by Halliburton – the infamous corporation that Dick Cheney had headed.52

On the federal Centers for Disease Control's website, one lone footnote cites four different vaccines to be administered for smallpox, not just the one that many older folks got in the 1950s – and even that was more dangerous than we were led to believe. Three of the four kinds of vaccines would be genetically engineered and administered to unsuspecting people, despite having never been tested. Basically, the CDC – now headed by Thomas Frieden, who until 2009 directed NYC's Department of Health – is proposing a massive experiment on a population driven to hysteria by the government and media. "At the end of the day, the numbers [of first responders receiving mandatory smallpox vaccinations]

could be significantly greater than 500,000," Hauer said.53

At first, a panel of outside experts – the Advisory Committee on Immunization Practices – rejected the proposal to mandate smallpox vaccinations to the general public. But Hauer and several other officials overruled that moderating recommendation and produced a firestorm within the Bush administration over the question of mandatory emergency vaccinations. Hauer recommended "that a phased approach be used, starting with 500,000 and then moving in steps to 10 million."54 But in a decision of unheralded courage and historical importance, the California Nurses Association – now a national labor union – heroically refused to allow themselves or their patients to be vaccinated with these unnecessary experimental vaccines, igniting a resistance movement across the political spectrum that threw a wrench into the gears. In blocking the government's "emergency" forced vaccination program for smallpox, the nurses saved tens of thousands of lives and pointed the way for new forms of resistance in the post-9/11 era.

2) Monitor the health and productivity of the U.S. animal populations and monitor the health-related attributes of animal products and veterinary biologics. Emergencies are more than the outbreak of only foreign animal diseases. An unusual presentation of a disease in this country can suddenly and negatively impact the public's purchasing decisions as well as importation decisions made by other countries. VS monitors foreign animal health and maintains an extensive domestic surveillance system to prevent incursions and quickly detect and diagnose outbreaks of exotic diseases. VS has been successful in its eradication campaigns against exotic Newcastle disease (1974), hog cholera (1978) and avian influenza (1984). In September 1999, it successfully isolated a virus from tissues of a crow from the New York city area. This virus was later identified as West Nile Virus (WNV) and confirmed as the cause of a human encephalitis outbreak. At the request of New York State, VS sent an early response team to assist in investigating the cases.

West Nile Plot Exposed!

16 FEB 2015 | 05:01

Last August, a little company based in Cambridge, MA?OraVax?received a $3 million grant from the National Institutes of Health to begin work on a West Nile vaccine.

As was reported in the Daily News on Aug. 21, "Federal health officials say they will recommend that anyone in the high-risk group?children and the elderly?take the vaccine." The story went on to report that OraVax hoped to begin human testing of the vaccine in 18 months?though federal officials were expecting it sooner?perhaps even by next summer.

Dr. Thomas Monath, vice president of vaccine research and medical affairs at OraVax, who's perhaps the world's leading authority on arboviruses (insect-borne diseases)?and the man behind the development of the new vaccine?says things are coming along "outstandingly well."

"We really only began this initiative last fall, briefly," he told me via telephone. "Then, when we got funded by NIH, we started around August 1. And at this point, we have generated a vaccine candidate, so we're initiating pre-clinical studies."

This all sounds like very promising news. However, it scares the hell out of a small handful of researchers and conspiracists, who are convinced that something ominous is behind it all. Why? Most of their concerns lie with the figure of Monath himself and, to a lesser degree, with OraVax.

A bit of background. From 1974 to 1988, Dr. Monath was the medical director of the Division of Vector (i.e., mosquito)-Borne Infectious Diseases at the Centers for Disease Control. Then, from '89 to '92, he was the colonel-in-chief of the virology division at the U.S. Army Medical Research Institute of Infectious Diseases at Fort Detrick, in Maryland.

In other words, he worked in the U.S. Army's biowarfare division?and that's what worries people. What's more, together with Jerome Hauer, former director of the Mayor's Office of Emergency Management, he's been an adviser to both President Clinton (on biowar preparedness) and Mayor Giuliani (at the initial outbreak of WNV). And now he just happens to be with the company that landed the grant to develop the vaccine?a vaccine that could well mean billions for the small biotech firm in the coming years.

The conspiracy stories range from speculations that WNV was accidentally released from the biological research facility on Plum Island to the firm conviction on the part of some that OraVax intentionally unleashed the virus upon the city?first, to ensure that they would sell their vaccine, and, second, as part of a grand eugenics experiment being spearheaded by the Rockefeller Foundation.

I asked Dr. Monath if he was aware of some of the things people were saying about him.

"I've seen the e-mails," he admitted. "Of course I don't know whether I've seen them all?I don't go looking for them, because they're all tommyrot. My friends send them to me. We don't fight these things or dismiss them, because they're trying to mix truth with lies?the standard way of making things believable. But it's all preposterous, and I'm happy to tell you why."

Dr. Monath explained that most of these conspiracy tales have arisen as a direct result of his background in biodefense. "I've served on many committees on biodefense issues and so on. I'm connected in that way, and people can find that out. Also, there's the connection with my interest in arthropod-borne viruses. What I'm doing now is corporate, and it's easy to weave all sorts of conspiracy theories together. I mean, none of this has any basis in fact. For example, there was one saying that I had done work on Japanese encephalitis vaccines when I was in the Army, and that's not true at all."

When you look at OraVax and Monath over the past 10 years, however, it's easy to see why some questions could arise.

OraVax, Inc. was formed in 1990.

In December of 1990, with the Gulf War still a few weeks away, the Dept. of Defense released a memo to the Tri-Service Vaccine Task Force, recommending, among other things, that the task force "Establish as high priority the institution of a Manhattan-like project to evaluate the above vaccines in a real operational setting and to develop specific vaccines for shigella sonnei, STLT and ST enterotoxigenic E. coli, West Nile Fever, and post-wound infectious agents."

In short, military researchers were working on a WNV vaccine 10 years ago, in preparation for the possible use of biological agents by the Iraqis.

In 1992, Monath left the military, and joined OraVax.

In May of 1997, as reported in the Boston Business Journal, OraVax was given a $322 million contract with the Dept. of Defense to develop vaccines for several potential biowar agents. According to the Journal, "[OraVax] will manufacture vaccines for at least two of the diseases being targeted by the defense department's Joint Vaccination Acquisition Program."

Unfortunately, according to an OraVax memo dated Aug. 18 of the following year, the deal fell through: "OraVax, Inc...announced today that it has been unable to reach agreement with DynPort concerning the manufacture and development...of the first two vaccines proposed under the program."

As a result of that lost contract, OraVax stock value plummeted from $75 a share to 25 cents, leaving the company on the brink of being booted off of NASDAQ.

Soon thereafter, OraVax was bought out by Peptide, a British vaccine manufacturer.

On April 10, 1998, Monath and Jerry Hauer met with President Clinton, suggesting that Clinton stockpile vaccines across the country in preparation for the possibility of a bioterror attack. The President rejected the idea.

across the country in preparation for the possibility of a bioterror attack. The President rejected the idea.

In the summer of 1999, as we all know, the first cases of WNV appeared in New York, and Monath and Hauer were called in to advise the Mayor on the crisis. A year later, OraVax received the NIH grant.

There's absolutely nothing ostensibly sinister in any of that. But it reveals that there was an initiative to develop a WNV vaccine 10 years ago?and that Monath was in such a position that he was quite possibly involved.

Some researchers on the subject have pointed out that it usually takes a full 10 years to develop a vaccine from the research stages to a point where human testing can begin. Yet OraVax is saying their vaccine will begin testing in 18 months, if not sooner.

It also seemed peculiar that there was an outbreak of WNV in New York just about 10 years after military research began?and that Monath was involved in the WNV hysteria from the very beginning?and that a struggling company that, just a year earlier, was in serious financial trouble, landed the contract. Was it all just very fortuitous?

I brought up the DoD memo to Monath, and asked about his involvement.

"I went to a number of those Tri-Service meetings," he said. "I don't recall anything specifically about West Nile. But at that time, I know that the folks at Walter Reed?where I was not, I was at Fort Detrick?were doing some initial work on West Nile. My recollection is it never really went anywhere. As far as I know, there was no STO, or Science and Technology Objective, or fund line for West Nile vaccine development. If there had been one, it would've been at Walter Reed, where the infectious disease threats were addressed. Fort Detrick only dealt with bioweaponry issues."

(It should be noted, however, that Dr. Monath's work at Fort Detrick took place at the Medical Research Institute of Infectious Diseases.)

And when I further asked him about the unusual speed with which the vaccine development seemed to be progressing, he explained, "It reflects this platform technology that we're using, which is very robust. We splice the genes for the co-protein of the virus into yellow fever [vaccine]. We've got a lot of experience with that, and it has proven itself to work again with West Nile."

There's much evidence of that, too. Monath has, in the past, developed several vaccines using his yellow fever vaccine as a base. You might say it gives him a good head start.

He also went on to explain that the NIH grant?which seemed paltry when compared with other grants and contracts OraVax has been involved with?was little more than seed money, used to kickstart the program?and that other investors would be needed as the work progressed. Three million dollars, it turns out, is also the maximum amount the NIH could grant them.

These are all responses that the conspiracists, of course, have their own scary answers for?with plenty of documentation to back them up. In and amongst all of the interweavings and speculations, though, they do raise a few very good questions.

"Why would you be working on a vaccine," asks Robert Lederman, president of A.R.T.I.S.T. (Artists' Response To Illegal State Tactics)?who's done perhaps more writing on "The West Nile Plot" than anyone else?**"for a disease that's so difficult to get? And so unlikely to even make anybody sick, let alone cause fatalities? When there are so many diseases in the world, why would you be pursuing this?"**

And he's got a point. West Nile just doesn't seem to be that bad?so why the hubbub about the vaccine?

The answer, I would guess, has less to do with government plots than it does with the nature of contemporary science. Like conspiracy theories, scientific work takes place in tight focus. Both study the tiniest of issues, the incidentals, in the hopes of adding something to the big picture.

For instance, it should be noted that the West Nile vaccine is not the only vaccine that OraVax is currently working on. A month after they received the $3 million NIH grant, they received a $343 million contract with the CDC to develop a new smallpox vaccine. They also have another dozen vaccines in the works. West Nile seems innocuous, yes?but it's also a strain of Japanese encephalitis, which does kill people?so the possibility certainly exists that it could turn into something worth worrying about. And if that's the case, why not have a vaccine for it?

Fact is, I would have been much more suspicious had they received $300 million for a WNV vaccine, as opposed to $3 million.

And what about Dr. Monath? How peculiar is it that he advised the President and the Mayor and then ended up at the company that received the contract? If you look at things backwards?his background in the military's biodefense program, etc.?it might seem more than a little suspicious. Questions of conflict of interest aside, however, Monath remains the world's leading authority on these diseases, as well as the most prominent researcher into the development of vaccines for these diseases. It seems likely that wherever he ended up?whether at a small company with a shaky past or the world's largest biotech firm?he would be the one who would be given the job.

Perhaps a more important question, though, concerns the spraying itself. There's no denying that the pesticides being dumped on the city are potentially much more harmful to humans than WNV. Lord knows they kill every form of aquatic life they touch. And we have no idea what sort of long-term effects they'll have on the health of New York's population. So why the quasi-military response to such a useless "epidemic"?

Lederman feels that it's a ploy, a patently offensive tactic used to make next year's vaccine a more pleasant alternative and ensure sales. But, again, I think there's a simpler answer?namely, that this is how we've always dealt with problems like this. Not only in New York, or in California with the medflies, but all over the world.

According to a 1998 article by the CDC's Duane Gubler, "Vector-borne infectious diseases are emerging or resurging as a result of changes in public health policy, insecticide and drug resistance, shift in emphasis from prevention to emergency response, demographic and societal changes, and genetic changes in pathogens."

Historical records going back to the early part of this century indicate that outbreaks of insect-borne diseases like malaria, yellow fever, sleeping sickness and the black plague have traditionally been met with kneejerk insecticide saturation, in order to contain the problem after the fact, by killing adult carriers. Thing is, this method always seemed to work for a while.

A few decades after the problem was taken care of, however, there have been resurgences of all these diseases?usually in more virulent strains?in Asia, Africa, Europe and North America. Everything came back.

"Although the reasons for the failure of [vector-borne disease control programs] are complex and not well understood," Gubler writes, "two factors played important roles: 1) the diversion of financial support and subsequent loss of public health infrastructure and 2) reliance on quick-fix solutions such as insecticides and drugs."

He goes on to argue for the development of vaccines and a greater emphasis on prevention as opposed to reaction.

Point being, I guess, that in response to WNV, the city is only doing what every country on Earth has done in the past?and because of it, we may need that damn vaccine down the road.

When I first started looking into this story late last summer, I was convinced something shady was going on with Monath and OraVax, even before I read any of Mr. Lederman's articles. I was so suspicious of the spraying that I desperately wanted to discover that something diabolical was behind it. Believe me, Lederman and the others writing on this subject tell good stories and make strong cases?until you take a step back. Or maybe two steps back, to a point where Occam taps you on the shoulder and whispers in your ear.

There are still plenty of questions that I have about the city's West Nile hysteria. But I've come to the conclusion that the answers are more likely to be found in human stupidity than in superhuman evil.

OraVax Inc. at work on Japanese encephalitis vaccine

By Tom Salemi –

Sep 29, 1997 Updated Sep 29, 1997, 12:00am EDT

OraVax Inc. of Cambridge just signed a licensing agreement to bolster the company's development of a vaccine for Japanese encephalitis, a mosquito-borne virus endangering billions of people in Asia.

The deal with St. Louis University's Chimeric Flavivirus Vaccines gives OraVax access to the Yellow Fever virus, an effective vaccine with an extraordinary ability to replicate, according to the company.

With the school's chimeric vaccine technology, OraVax will try to meld the fast-growing quality of the Yellow Fever virus vaccine with the company's vaccine against Japanese encephalitis, dengue, hepatitis and other viruses.

The encephalitis vaccine is just one of the four the company vowed to focus on after its reorganization in the spring.

One vaccine will protect nursing-home residents who may be susceptible to certain strains of colitis or diarrhea, and work continues on the vaccine to prevent peptic ulcers.

Meanwhile, OraVax will be taking another big step with HNK20, an experimental drug created to ward off a respiratory virus in infants.

The drug didn't fare too well in tests conducted last winter in Argentina, Australia, New Zealand and South Africa, where it failed to reduce hospitalization much better than a placebo.

With cold and flu season on the way, OraVax wants to conduct a second Phase III trial on younger patients this winter, this time focusing on infants four months of age and under, where the drug proved to be most effective.

But OraVax still hasn't found a corporate partner to pay for the study.

Spokeswoman Kelly Conlon said the company needs to settle on a partner within the next three weeks.

The major vector in NYC was the Culex pipiens mosquito, but WNV has also been previously isolated in the Aedes vexans and Anopheles mosquitoes. The source of this outbreak could have been an infected bird (either migrated or imported), infected mosquitoes, or, less probably, a viremic person. West Nile fever normally does not cause birds to become ill, but during the NYC outbreak thousands of crows died and smaller numbers of birds of other species in the greater New York metropolitan area [9]. **In the past, WNV has been isolated in horses with encephalitis in Egypt, France, Portugal, Morocco, and Italy, but this is not common [10, 11]. In the New York outbreak ofWNV, »25 horses in the North Fork of Long Island (a suburb of NYC) became clinically ill, of which 9 died and 16 recovered (S. Trock, Cornell University and New York State Department of Agriculture and Markets, personal communication**). One cat also died of WNV infection in New Jersey (J. Brook, New Jersey Department of Health, personal communication). Camels, sheep, goats, and dogs can become infected, but they do not maintain virus in nature as well as birds because they have a lower population density and a slower reproductive rate [11]. It has been shown that domestic mammals either develop low-level or undetectable viremia after experimental infection. WNV has also been found in wild ixodid and argasid ticks, but their role in infecting humans is not well established [11].
The

"North Fork of Long Island" ... is not a "suburb of New York City"

'West Nile Virus' Outbreak And Dead Lobsters

When I learned about the outbreak of the brand new altered/mutated strain of West Nile Virus, I began to spend more and more time investigating Plum Island.

I have learned that Plum Island had a fiber-optic cable installed and finalized in March, 1999. During the finalization of the installation of that cable, by STV, Inc. power to the island and the facility had to be cut. All power was to go through the cable, even back-up power.

Plum Island uses a negative pressurization to maintain biocontainment. In other words, as you go to the center of the facility, where the exotic disease labs are located, the pressure is depressurized. This would prevent microbes from release should an accident happen. Negative pressurization depends on power. I have been told that the power to the facility was cut to finalize the installation of the cable.

I have learned that in the 1970's there was an accidental release of microbes. All of the people were safely evacuated, in paper clothes, from the Island. The animals were incinerated and then the Island and Facility was sprayed with toxic chemicals to decontaminate it.

The investigation of Plum Island is still ongoing. I am also investigating the death of the lobster population in Long Island Sound. Lobsters are dying by the millions. I feel this mass die-off is related to the material uncovered in my Plum Island investigation. I am, also, still in the process of investigating the 'West Nile Virus.'

http://www.rag.org.au/sra/plum.htm

...

Threats To Stop The Investigation

Thus far, I have found an equid outbreak of the same/or almost the same strain of West Nile Virus, not far from the United Nations Biocontainment level 5 facility in Italy. The outbreak happened Fall of 1998.

According to the charter of the diagnostic facility at Plum Island, foreign disease samples should have gone to Plum Island during that outbreak.

My latest findings also places Japanese Encephalitis at the Plum Island facility. In addition, Plum Island doctors have tested Japanese Encephalitis vaccine on HUMAN VOLUNTEERS.

Evidently, I have unknowingly stumbled upon something that "someone" in "some" agency does not want made public.

One of the last radio programs that myself and my partner William Thomas did, is mysteriously now unavailable on the internet archives.

A friend and confident who had worked in the US Military Biowar program and who has friends at some of the alphabet soup agencies, told me that I have attracted the attention of someone in an agency. He said, "they want to keep what I have discovered, in the shadows." He also said that they want to silence me.

My investigation continues. When I first began, I tried to get the documents to the mainstream media. NO TAKERS.

I sent the info to William Thomas, the author of "Bringing the War Home," and "Scorched Earth." William Thomas very bravely took over the investigation for me.

I am not a professional, I am just a private citizen who began to ask questions. Many of which remain unanswered at this time.

I am sincerely grateful, To William Thomas, who took time from his busy schedule and his own investigations, specifically of the Chemtrails, to help me. I could not carry one without his help. I sincerely want to thank you, Will Thomas.

I, also, want to thank Jeff Rense, Art Bell, and David Oates for enabling me to have a forum to discuss my research.

As for my health, my friend (whom I fondly call' Capt. X') is quite concerned. There are those in our Government who want this to remain in the shadows. I just cannot go along with that. I am continuing my investigation with my partner, William Thomas. Together, we are in the process of explaining where a pathogen, never before seen in the Continental U.S., has originated.

I will keep updating the Plum Island, Biocontainment Level 5, story.

Patty Doyle

** As a footnote: The Italian West Nile virus has been traced back to Senegal 1993. I am in the process of checking labs near that outbreak and will keep you updated.

https://watermark.silverchair.com/33-10-1713.pdf?token=AQECAHi208BE49Ooan9kkhW_Ercy7Dm3ZL_9Cf3qfKAc485ysgAAAp4wggKaBgkqhkiG9w0BBwagggKLMIICHwIBADCCAoAGCSqGSIb3DQEHATAeBglghkgBZQMEAS4wEQQMzrTBDbqgOyi2LL15AgEQgIICUehJ8818xAInHS8S1PiwtOfRz3KjTFvEf0WtIr0wpIJsfvM8cXc1SoG2w_1WvjuaAQfIdlBbMXjPWn0-5cLDYNWtJakduYVa5r_sgf537xiG9arDZV2_-ZPRWuQozCVuSzrLn-QQPUVfuZbzvAsQrMlnFZbFIDAedRhoYyBD2INI7C0LEbEIeqA1h_jgINvPXlDDfgITrYr-g7vWlgiMykSi9MZRdRNGurvvOrqCsSu9R94kiuuRx0kzFU7A_PiHMSOeXXRgxfxo3GkhrYdrZ-D-I-6MTWpevhHP3F7a37RWowDpKDAUjWqZF3dI_UyrHwyIALdhKJaeRyjMkwAdfHAcWzs7Wpxwax9trP1r6XRmdA1Fj5U3K-cw3XuaE_w8LAx4lkd16z82WeNu9YkPJAU7OZ4CWze_jiUkOZNlgAltITtBiP6T7fCC7Ya4W6H004cvsViMcrvX_D9isopSm4YL5DJO1gzKNlbZN9wVoojIDWPmBEChGBuoiyogjfjrVKZWBSJF5a1zKLhCGFOnPPRx3B3PEOvRpMIMhPfhRDPp5a7Z6yE4Y1buQdftgluzdFY6gnRYMh5qipCKCl2zo6FfiYSF5Bv6-zHZzLbsImJv8Pgq6kOMCehA-DSohe2Sue-seawI3k9MA1sQSj6Lu0Oh8hR7UGfnqNRl83Knk4rJ-g0SvQusVf50VQrIYsqtBUPZeVo5N_3ApPzyBOn13frwZKQqcFSDApVpB3o7kDxHcSN0LBMcv8dI5EKUNGQIJ1L4W6Sp7daLXUvvUZfxo67U

In 1999, an epidemic of West Nile virus (WNV) encephalitis occurred in New York City (NYC) and 2 surrounding New York counties.
In August 1999, an epidemic of West Nile virus (WNV) encephalitis and aseptic meningitis began in New York City (NYC) [1–3]. Over 8 weeks, 59 people were hospitalized with severe neurologic illnesses; 7 died. Concurrent epizootics with high mortality occurred in birds, particularly American crows (Corvus brachyrhynchos), and in horses on Long Island.

In 2000, 63 horses with neurologic and other illnesses due to WNV infection were reported from 26 counties in 7 states (New Jersey, New York, Connecticut, Delaware, Massachusetts, Pennsylvania, and Rhode Island) [4]. In follow-up studies of ill horses, the US Department of Agriculture documented a case fatality rate of 38% (unpublished data). These cases in horses suggested that the risk for human infection, including the presence of infected mammal-biting mosquitoes, were more widespread than the 10 counties reporting human cases.

It doesnt say WHICH towns in 1999 for horses...

2000 (April 26) - NYTimes : "A Bug That Can Fell a Horse; Fighting Mosquitoes' Threat to Thoroughbreds"

By Sarah Kershaw , **April 26, 2000** / Source : [HN01IF][GDrive]

The obsession with mosquito control at the two tracks is no surprise, given the routine frenzy surrounding the health of horses. In addition to the nine horse deaths, on a cluster of farms near Riverhead on Long Island, the virus infected 16 other horses, including 2 thoroughbreds that were racing at Belmont and another horse that raced at Yonkers.

...

Amid all this, it is still unclear whether West Nile will reappear in the New York City area or spread to Long Island again. Recent tests on hibernating mosquitoes in **Fort Totten, Queens, near the epicenter of the 1999** outbreak that infected 69 people, confirmed that the virus was still alive there. And In Westchester, a dead bird tested positive last month for the virus, raising fears that West Nile will reemerge this summer.

"You wouldn't even want to think about it," said John Dowd, a trainer, who was working with 10 horses at Aqueduct before the races there last Thursday. Among Mr. Dowd's charges that day were some racehorses, like Wires Crossed and Critical Thinker, worth up to $10 million.

Farm managers, particularly those on the East End of Long Island, where the virus struck last year, and other horse breeders said they were taking precautions similar to those at the racetracks, including using the mosquito dunks in standing water. Several said they were planning to stable their horses at night, spray them with pesticides and keep them in barns at dusk and dawn, peak mosquito hours. A few breeders said they were considering stabling their horses in upstate New York or in other states.

Jeff Raine, who manages the B**ig E farm in Jamesport, N.Y., where two horses, including a thoroughbred brood mare, succumbed to West Nile last year,** said he was doing everything he could to prepare for mosquito season. The 120-acre breeding farm is owned by Robert Entenmann of the baked goods company, and is home to 15 horses that serve as Mr. Entenmann's private breeding and racing stock.

In the feverish world of horse racing and breeding, mosquito season is about as welcome as a hurricane at the Preakness.

Especially this spring, given the prospect of a repeat of the West Nile virus -- which killed seven people and nine horses in New York last year, including a retired racehorse who was to breed thoroughbreds. The possibility that the mosquito-borne illness could destroy a multimillion-dollar celebrity like Fusaichi Pegasus, the Kentucky Derby favorite who spent four days training at Aqueduct before winning the Wood Memorial there on April 15, has track officials

more hyper than in-bred thoroughbreds.

So, these days, there are some rather strange goings-on at Aqueduct and Belmont Park, both near the epicenter of the outbreak in northern Queens and both part of an industry that contributes more than $1 billion annually to New York State's economy.

Take the chickens at Belmont, the nation's largest track, on the Queens-Nassau border. Once welcome to spend all their days scuttling around the stables and barns there, they now have a $5 bounty on their heads and are being rounded up by the hundreds.

Horsemen brought chickens to Belmont soon after the gates opened in 1905 to calm the high-strung thoroughbreds by lending a barnyard feel to the stables. But erstwhile friends, the fowl, now known to help spread West Nile, are being trapped in padlocked coops and tested for the virus. So far, almost 500 have been shipped to a farmer upstate, racing officials said.

While kicking out the chickens, Belmont officials are bringing in fish. After investigating the behavior of various species to find some that eat mosquito larvae, racing officials last week dumped 4,000 goldfish and catfish into the two lakes in the main track's infield, and into a duck pond near the grandstand.

Then there was the pesticide deal with the Native American chief. Racing officials spent $10,000 on a latex chemical called Ultracide produced by the man's company, Native American Enviro-Tech. They were told it would kill the bugs but not harm the horses. But the state has blocked the use of Ultracide because it is not registered in New York.

The obsession with mosquito control at the two tracks is no surprise, given the routine frenzy surrounding the health of horses. In addition to the nine horse deaths, on a cluster of farms near Riverhead on Long Island, the virus infected 16 other horses, including 2 thoroughbreds that were racing at Belmont and another horse that raced at Yonkers.

At the track, a cough or a sneeze is cause for alarm; wobbling, twitching and circling, symptoms of West Nile infections in horses, sends veterinarians and trainers into red alert.

"The stars of this sport are the horses," said Francis J. La Belle Jr., a spokesman for the New York Racing Association, which owns and operates New York's three largest tracks, at Belmont, Aqueduct and Saratoga. "We go nowhere without them."

Horses, like humans, can recover from West Nile, which can be deadly if it leads to encephalitis, swelling of the brain. Infections can range from what looks like a minor flu to serious neurological illnesses; but three racehorses that were infected with the virus last year recovered, and, so far, two have gone on to race, according to the veterinarians who treated them. (Some horse owners take out health insurance that could cover illness or death from West Nile, but others do not, experts said.)

Officials at both Queens racetracks are also dropping doughnut-shaped "mosquito dunks" made of larvicide, which kills the eggs, into other bodies of standing water that are mosquito breeding grounds. They are also setting up mechanical mosquito traps across the 430-acre Belmont property, and the Nassau County Health Department plans to set up a mosquito-trapping station there to catch the bugs and test them for West Nile, officials said.

Amid all this, it is still unclear whether West Nile will reappear in the New York City area or spread to Long Island again. Recent tests on hibernating mosquitoes in Fort Totten, Queens, near the epicenter of the 1999 outbreak that infected 69 people, confirmed that the virus was still alive there. And In Westchester, a dead bird tested positive last month for the virus, raising fears that West Nile will reemerge this summer.

"You wouldn't even want to think about it," said John Dowd, a trainer, who was working with 10 horses at Aqueduct before the races there last Thursday. Among Mr. Dowd's charges that day were some racehorses, like Wires Crossed and Critical Thinker, worth up to $10 million.

Farm managers, particularly those on the East End of Long Island, where the virus struck last year, and other horse breeders said they were taking precautions similar to those at the racetracks, including using the mosquito dunks in standing water. Several said they were planning to stable their horses at night, spray them with pesticides and keep them in barns at dusk and dawn, peak mosquito hours. A few breeders said they were considering stabling their horses in upstate New York or in other states.

Jeff Raine, who manages the Big E farm in Jamesport, N.Y., where two horses, including a thoroughbred brood mare, succumbed to West Nile last year, said he was doing everything he could to prepare for mosquito season. The 120-acre breeding farm is owned by Robert Entenmann of the baked goods company, and is home to 15 horses that serve as Mr. Entenmann's private breeding and racing stock.

"I've had nightmares about it recurring," said Mr. Raine, who had to pu**t to sleep the brood mare, Terroir, a retired racehorse who ran at Aqueduct and Belmont** a year before she was sent to the Jamesport farm to breed. "We're very concerned about what's going to happen this year."

Terroir's illness was the first confirmed case of equine West Nile in last year's outbreak, said Dr. John Andresen, the veterinarian who treated her and diagnosed her as having the virus. Government scientists are using genetic material from Terroir for research on a possible vaccine, he said.

At Belmont and elsewhere, state officials are testing the blood of chickens, which carry the virus but do not get sick from it, for signs of West Nile. Chickens can spread the virus to horses if mosquitoes bite infected chickens and then bite horses. But horses, "dead-end hosts," cannot spread the disease to other horses or species, experts said.

A group of chicks from Belmont who were tested recently showed no sign of exposure to the virus, said Dr. Neil Cleary, a veterinarian with the racing association who treated one of the two Belmont racehorses who was infected with West Nile but recovered.

State agriculture officials said that since the outbreak, they have conducted blood tests on horses in the Riverhead area and across Long Island to determine how many were exposed to the disease, possibly making them immune. Results released so far showed that of 69 horses tested in the Riverhead area, 20 were exposed to the disease but did not get sick. The incubation period is up to seven days, so those horses would not be at risk for infection, veterinarians said.

It is still not known why the virus struck that cluster of Long Island farms, 60 miles from the Queens epicenter of the outbreak. But several experts said they suspected West Nile was carried to Riverhead, on the tip of the island, by birds.

Dr. Andresen and other veterinarians who have studied the virus since last year's outbreak, the first time West Nile was detected in the Western Hemisphere, said the newness of the disease here made it difficult to understand the risks and to calm nervous breeders and horse owners.

"It leaves the vets in a quandary," said Dr. Howard Flynn, president of the Long Island Veterinary Medical Association, who runs a clinic in Medford, N.Y. . "This is brand-spanking new around here, and that's part of the problem."

Only one other documented outbreak of the virus caused as many deaths among horses as the Long Island one, a 1996 outbreak in Morocco. It killed 42 of 94 horses confirmed to be infected, said Dr. Peter Timoney, director of the Gluck Equine Research Center at the University of Kentucky in Lexington. A smaller outbreak occurred in Tuscany, Italy, in 1998, Dr. Timoney said.

Dr. Timoney and other veterinarians said that only a few outbreaks of West Nile had occurred among horses since the virus was first detected, in Uganda in 1937. But they said they were concerned about the high mortality rate among infected horses. Almost half the horses with confirmed cases -- 9 of 25 -- either died or were so sick they had to be put to sleep, a mortality rate far higher than the 4 or 5 percent rate for humans.

"Statistically we haven't seen a major occurrence of this disease in horses," Dr. Timoney said. "Still, think about the stakes: these Kentucky Derby hopefuls. If that one animal becomes seriously infected and dies, that's one hell of an economic loss."

Charles Wohlstetter, 85, Founder of Contel, Dies

By JOHN HOLUSHA

Charles Wohlstetter, who developed small rural telephone companies and combined them into a $3 billion business before selling it to the GTE Corporation, died yesterday at his home in New York City. He was 85.

Mr. Wohlstetter, who was born and educated in New York City, entered the telephone business when he was 50, after a long and varied career.

In 1929, at age 18, he graduated from what was then City College of New York and got a job as a runner at a small stock brokerage firm, where he quickly advanced to become a small-scale money manager. He survived the stock market crash that year and set up a brokerage house with a partner.

He was successful but restless. In 1938, he moved to Los Angeles to write screenplays. During the year he spent in Hollywood, he sold three, one of which was made into a low-budget film called "What Millionaire Playboy."

Although many writers go for years without having a film produced, Mr. Wohlstetter was dissatisfied and returned in 1939 to New York, where he organized a company to make aircraft parts for the Army. World War II brought the company plenty of business, and with the profits Mr. Wohlstetter opened an investment banking company.

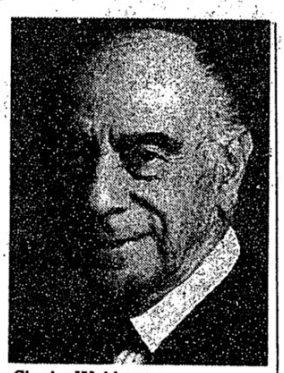
A $1.5 million investment in a small telephone company in Alaska got him interested in the thousands of independent companies scattered across the country. He formed the Continental Telephone Company with two partners in 1961 and acquired hundreds of independents.

The company, later known as Contel, pushed into new technologies, not always successfully, and in 1990, it paid $1.3 billion to acquire rights to 8.1 million potential cellular telephone customers in Kentucky, Alabama and Tennessee.

Mr. Wohlstetter had hoped to pay for the acquisition with a public offering of stock, but by the time he was ready, telephone stocks had lost favor and he could not get the price he wanted. The company then agreed to be acquired by GTE, a combination that created the country's largest local telephone company. Mr. Wohlstetter, then 80, joined GTE as vice chairman of the board, a position he held to his death.

At the time of the merger, Contel had grown to having $6 billion in assets, $3 billion in annual revenues and operations in 32 states, South America, Asia, Europe and the Middle East.

Mr. Wohlstetter enjoyed his wealth, collecting art, which is displayed at his home and office, and investing in a vineyard and winery in Bordeaux, France. He was also chairman of the Billy Rose Foundation, vice chairman of the board of trustees for the National Symphony in Washington and a trustee of the Foundation for Research in Medicine and Biology.



Charles Wohlstetter

He is survived by his wife, Rose, of New York City; three sons, Philip, of Seattle, John, of Washington, and Rand, of New York City; a brother, Albert, of Los Angeles, and two grandchildren.

Occupation

- Military strategist
- Systems theorist

Known for *The Delicate Balance of Terror*[2]

Spouse(s) Roberta Wohlstetter (née Morgan)

Children Joan Wohlstetter-Hall

Albert James Wohlstetter (December 19, 1913 – January 10, 1997) was an American political scientist noted for his influence on U.S. nuclear strategy during the Cold War. He and his wife Roberta Wohlstetter, an accomplished historian and intelligence expert, received the Presidential Medal of Freedom from Ronald Reagan on November 7, 1985.

Early life and education

Albert Wohlstetter was born on 19 December 1913, the fourth and youngest child of Philip Wohlstetter and Nellie (née Friedman). His paternal grandparents were cosmopolitan Jews who immigrated to the United States from the Austro-Hungarian Empire in the latter half of the nineteenth century. Albert's father, Philip, was born in the United States about twenty years later.[1] Albert's older siblings were William (1902–1967), Helene (1906–1974) and [Charles Wohlstetter (born 1910) (died 1995)]. Albert's brother Charles was an accomplished businessman who would help Albert get his start as a young man. Charles also employed Helene at one of his companies, ConTel, where she was killed in a shooting by a disgruntled employee in 1974.[2]

The Wohlstetters lived in the Washington Heights neighborhood of Manhattan. After attending the City College of New York, Philip Wohlstetter became an attorney and served as chief counsel to the Metropolitan Opera. In 1912, he founded one of the early phonograph companies, the Rex Talking Machine Corporation. Luminaries of the performance world were regular guests in the Wohlstetter home. The Rex company was taken over and its Wilmington, Delaware factory converted to war production during the World War I. Philip died of a heart attack in 1918 when Albert was four years old.[3]

City College of New York

Wohlstetter started at City College of New York in 1931 through a scholarship in modern dance, earning a B.A. in 1934. At the time he was involved in radical politics, and was a member of the League for a Revolutionary Workers Party, a Trotskyist splinter group, in the mid-1930s.[4]

Columbia University

Wohlstetter started at Columbia Law School on a fellowship in 1934. It was in a class there that he met Roberta Morgan. Wohlstetter was bored by law school and left the program after only one year. He stayed at Columbia to pursue a Ph.D. in mathematical logic and the philosophy of science where he studied under Abraham Wald and was a peer of Jacob Wolfowitz.[5] After a thesis titled *Language and Empiricism* earned him an M.A. in June 1937, several

fellowships allowed him to work on his dissertation. He had a fellowship with the Social Science Research Council on a project to incorporate modern mathematical methods into economics and business cycle research. From 1941–1942 he was a research associate at the National Bureau of Economic Research.[6]

In August 1942 the Wohlstetters vacationed with Dwight Macdonald, one of the editors of *Partisan Review*, and his wife, Nancy in Nantucket.[7]

He left Columbia's graduate program to work for the U.S. government on war planning during World War II and never completed his doctorate.

Early career

During the Second World War, Wohlstetter worked on problems of war production. He was first hired by the Planning Committee of the War Production Board. It is unclear how he ended up there. In an interview, Wohlstetter says that while on the Carnegie associateship with NBER, Simon Kuznets was hired by Robert R. Nathan and it was Kuznets who hired Wohlstetter.[8] Albert's brother [**Charles Wohlstetter (born 1910)**] recounts that it was Arthur F. Burns who gave Albert the job.[9]

Later he worked at Atlas Aircraft Products Company.

After the war, Wohlstetter worked briefly in business in New York.[10] He moved back to Washington, D.C. to serve as the Director of Programs for the National Housing Agency (USHA) in 1946 and 1947, the only time in his career he was a federal employee.[11] At the USHA Wohlstetter worked with Paul Weidlinger, an engineer who had worked during the war for an aircraft company owned by Albert's brother, [**Charles Wohlstetter (born 1910)**], designing modular buildings such as airplane hangars that could be assembled quickly. At the USHA Wohlstetter and Weidlinger worked on applying such principles to domestic residential buildings.[10]

During the 1937–1938 school year, Roberta had worked as a teaching assistant at the University of Southern California, during which time she became enamored with the California lifestyle.[12] At her urging, and with his brother Charles helping to secure a job for Albert, the Wohlstetters moved to Santa Monica in 1947. Albert went to work for the General Panel Corporation to "tool up" their industrial plant. General Panel Corporation was a company founded by Walter Gropius and Konrad Wachsmann, two important figures in the Bauhaus movement.[13]

RAND Corporation

While on a walk, Albert and Roberta ran into Abe Girschick, Olaf Helmer and Chen McKinsey on the street in Santa Monica. Albert knew the three from his days as a student and in government service.[14] The three mathematicians "... were overjoyed to see us. Mathematical logic was a very, very small world. There were only a little over a dozen mathematical logicians before the war in the United States ..."[15] Girschick, Helmer and McKinsey were working at the recently formed RAND Corporation. With their help, Hans Speier, the head of the RAND social science division, hired Roberta, initially to write book abstracts for circulation to the RAND staff.[16] When General Panel Corporation finally went out of business in 1951, Albert wanted to return to academia in the east, but Roberta was intent on remaining in California.[17] She set up a meeting between Albert and Charles J. Hitch, the head of the RAND economics department. The two hit it off and Wohlstetter was brought on as a consultant to the Mathematics Department.[18]

Wohlstetter remained a consultant with RAND for the first few years. It was not until June or July 1953, a few months after he began briefing *Selection and Use of Strategic Air Bases* to the Air Force that Hitch finally insisted that his consultant status was "absurd" and that he join the permanent staff.[19]

At RAND, he researched how to posture and operate U.S. strategic nuclear forces to deter plausible forms of Soviet nuclear-armed aggression in way that was credible, cost-effective and controllable.[20]

Wohlstetter's *The Delicate Balance of Terror* (1958) was highly influential in shaping the thinking of the Washington foreign policy establishment, particularly in its emphasis on the looming threat of Soviet attack.[21]

During this period, Wohlstetter's relationship with fellow RAND strategist Bernard Brodie grew increasingly acrimonious. In 1963, Brodie accused Wohlstetter of a security violation and financial malfeasance. Wohlstetter had shared a draft RAND paper by Constantin Melnik with Henry Rowen, then one of the Whiz Kids working as the Deputy Assistant Secretary of Defense for International Security Affairs under Robert McNamara. Brodie also claimed that Wohlstetter was extravagant in wining and dining clients and colleagues using RAND funds. Wohlstetter defended himself by pointing out that the Melnik paper was only a "D" designated document, RAND's lowest level classification, and as a former RAND employee who had collaborated extensively with Wohlstetter on some of his most important studies, Rowen was authorized to receive the paper. Nevertheless, RAND Director Frank Collbohm demanded that Wohlstetter submit his resignation. When Wohlstetter refused, Collbohm fired him, but agreed to let Wohlstetter stay on at RAND long enough to find another job.[22]

University of Chicago

At the suggestion of Hans Morgenthau and with his help, Wohlstetter secured a position as a professor of political science at the University of Chicago.[23]

In the 1960s and 1970s, he expanded the scope of his research to include alliance policy and nuclear nonproliferation,[24] ballistic missile defense, [25]innovation in military technology,[26] peacetime military competitions,[27] and military potential and economics of civil nuclear energy.[28]

In the 1980s, Wohlstetter frequently criticized proponents of mutual assured destruction who supported targeting of nuclear weapons on civilians and cities instead over enemy combatants and military forces.[29]

Wohlstetter and his wife, Roberta Wohlstetter, also counseled both Democratic and Republican administrations, including advisers to President John F. Kennedy during the Cuban Missile Crisis in 1962.[30] They received the Presidential Medal of Freedom from Ronald Reagan on November 7, 1985.

During his long career, Wohlstetter also taught at UCLA and the University of California, Berkeley, in the early 1960s. From 1964 to 1980, he taught in the political science department of the University of Chicago, and chaired the dissertation committees of Paul Wolfowitz, Efraim Inbar and Zalmay Khalilzad. He is often credited with influencing a number of prominent members of the neoconservative movement,[31] including Richard Perle (who, as a teenager, dated Wohlstetter's daughter Joan).[32] He is the uncle of John Wohlstetter, author of *Sleepwalking with the Bomb* and *The Long War Ahead and The Short War Upon Us*.[33]

January 12, 1988

The Commission on Integrated Long-Term Strategy meets with President Reagan to discuss their report, Discriminate Deterrence. Members of the commission on the left side of the table (clockwise from the bottom of the photograph to the top): Gen. Bernard Schriever, former Commander, Air Force Systems Command; Judge William P. Clark, former National Security Adviser; Ambassador Anne Armstrong, Chairperson, President's Foreign Intelligence Advisory Board; Gen. John Vessey, former Chairman of Joint Chiefs of Staff; Albert Wohlstetter; Fred Iklé, former Under Secretary of Defense for Policy; Zbigniew Brzezinski, former National Security Adviser; Gen. Andrew J. Goodpaster, former NATO Supreme Allied Commander; W. Graham Claytor, Jr., former Secretary of the Navy and Deputy Secretary of Defense; Samuel P. Huntington, Director, Center for International Affairs, Harvard University; Admiral James L. Holloway III, former Chief of Naval Operations **(Commission members not present: Henry A. Kissinger, former National Security Adviser and Secretary of State; [Dr. Joshua Lederberg (born 1925)], Professor of molecular genetics and informatics and President of Rockefeller University)**. Death

On 16 December 1996, his 83rd birthday, Wohlstetter was not feeling well. He and Roberta thought he was just ill or having an asthma attack. Over the telephone from New York their daughter Joan reviewed the symptoms for a heart attack and told Roberta to call an ambulance. Albert made a fuss, not wanting to go to the emergency room. At the hospital he was diagnosed as having had a serious heart attack and was discharged home with around-the-clock nursing care. In the living room he set up a makeshift chair that allowed him to partially recline so he could continue to work. A month later, on 10 January 1997, Wohlstetter died at his Laurel Canyon home.[34]

A memorial was held at the office of the RAND Corporation[35] and a month later Senator Jon Kyland special guest Richard Perle conducted a brief remembrance in the Senate chamber.[36] Albert Wohlstetter is buried at Westwood Village Memorial Park Cemetery in Los Angeles. Roberta Wolstetter died on 6 January 2007.

Awards

> President Ronald Reagan presents Albert and Roberta Wohlstetter and Paul Nitze with the Presidential Medal of Freedom. The East Room of the White House, Washington, D.C., 7 November 1985. Photograph by Peter J. Souza, courtesy of the Ronald Reagan Presidential Library.

He was twice awarded the Department of Defense Medal for Distinguished Public Service, first by Robert McNamara in February 1965 and again by Donald Rumsfeld in November 1976. He is the first recipient not employed by the Department of Defense and the first person awarded it twice.[37]

On 7 November 1985 President Reagan awarded Albert Wohlstetter, along with his wife Roberta Wohlstetter and Paul Nitze, the Presidential Medal of Freedom.

Legacy

The *Albert J. and Roberta Wohlstetter Papers* are available at the Hoover Institution Archives at Stanford University.

In popular culture

Wohlstetter served as one of the inspirations for Stanley Kubrick's film, *Dr. Strangelove or: How I Learned to Stop Worrying and Love the Bomb*. In 1962, Kubrick was looking for his next project after *Lolita* and started reading intensively on nuclear issues. One of Kubrick's early ideas was to make a realistic thriller, titled after Wohlstetter's "Delicate Balance of Terror". But Kubrick could not conceive of a realistic scenario for an accidental nuclear war, so turned instead to the idea of making a comedy. The character of Dr. Strangelove is a composite of numerous people associated with RAND that besides Wohlstetter included Herman Kahn, John von Neumann, Wernher von Braun, and Edward Teller. [...]

March 12, 2013 7:17 pm ET - Wall Street Journal - "Chinese 'Hackers' Is a Misnomer. They're Spies."

https://www.wsj.com/articles/SB10001424127887323978104578332020833172726

2013-03-12-wall-street-journal-john-wohlstetter-chinese-hackers.pdf

The U.S. is under cyber attack from a hostile regime. Forceful American digital counterattacks are in order.

By John C. Wohlstetter

In a speech on Monday at the Asia Society in New York, National Security Adviser Tom Donilon addressed Chinese cyber intrusions into U.S. government and business network infrastructures. In moving cybersecurity "to the forefront of our agenda," Mr. Donilon noted that he wasn't referring to "ordinary cybercrime or hacking." He called on Beijing to recognize the importance of cyber issues, take "serious steps" to investigate Chinese cyber intrusions, and engage in a "constructive dialogue" to define "acceptable norms of behavior in cyberspace."

To his credit, Mr. Donilon differentiates between hacking and China's threat in cyberspace—the software that controls the operation of networks linking computers in the governmental and private sphere. But in asking Beijing to investigate cyber intrusions, he is asking the government to investigate its own military's massive continuing cyberspying. While his speech reflects a desire to be diplomatic in public, it muddles the true nature of the threat and thus may confound U.S. efforts to respond.

After last month's report by Internet security firm Mandiant linking China's People's Liberation Army to hundreds of thousands of cyberattacks across the globe, including against U.S. corporations and government agencies, cybersecurity is finally getting the media attention it deserves. Yet there remain misperceptions about cyberthreats and how to respond. For instance, Chinese cyber intruders on the PLA payroll shouldn't be considered "hackers." They are spies for the Chinese government. Mr. Donilon's speech would have made the distinction clearer in the news media and in the public mind, had he not called on Beijing to fix the problem, as if it originated elsewhere.

Hacking has historical associations that differ considerably from what the PLA is doing. From the late 1960s through the early 1980s, hackers were mostly a benign phenomenon: pranksters playing hide-and-seek with network administrators. Sometimes they even played the role of outsiders testing firewalls to inform administrators of security problems.

By the 1980s, hacking had acquired a second, negative connotation. Malicious software—"malware"—made its appearance. Malware encompasses "viruses" that begin self-replicating when activated by the unsuspecting user. Also included are "worms" that replicate without user action, "logic bombs" that activate at a later time, and "Trojan horses" that appear to be legitimate programs even when detected.

Hackers from time to time purloined or altered data, malicious acts that led to the passage of federal and state laws making such intrusions unlawful. But the authorities still were dealing with a small-scale phenomenon.

Yet in the late 1980s there was a glimpse of cyberthreats to come: On May 13, 1988, Israel detected and stopped the "PLO virus," a logic bomb designed to infect and destroy files on computers at Hebrew University timed for May 14, 1988, the 40th anniversary of Israel's independence.

In the 1990s, significant economic damage became a reality. The emergence of the public Internet meant that networks connected to the World Wide Web served not thousands but many millions of computers through myriad interconnected networks.

The first decade of the 21st century saw the rise of network use by two new, malevolent actors rarely present before: terrorist groups and hostile governments. Shortly after the 9/11 attacks, Richard Clarke, the top government bureaucrat focusing on cyberthreats during the late Clinton and early George W. Bush years, was right to warn of a looming "digital Pearl Harbor."

Yet unlike terrorist organizations that generally inspire individual or small groups of hackers, the Chinese are conducting operations—cyberspying and widespread theft of sensitive data—akin to what the Soviets did during the Cold War to better position themselves in the event of a hot war. Mere hackers don't steal volumes of documentation on the ultra-advanced F-35 Lightning, the only fifth-generation fighter still being produced by the U.S. China's spies have invaded every major national-security database that they can within the Pentagon and U.S. defense companies.

In the event of war, China could use stolen data to bypass security firewalls and launch cyber strikes to blind the global positioning satellites that direct U.S. weapons to their targets and to disable satellites that enable global military and diplomatic voice and data communications. They also could cripple U.S. public telecommunications networks that link financial, energy, transportation and electric-grid infrastructures. China's newest Stealth fighter, the J-31, closely resembles the F-35.

So what should the U.S. do?

Begin by acknowledging the magnitude of the threat. The PLA's "Third Department," which handles telecommunications, can call on 12 operation bureaus to carry out cyberattacks, and three research institutes for technical support with some 13,000 staff upon request. The volume of stolen data is staggering: In March 2011, a single cyber intruder stole 24,000 files from a defense industry computer network.

A full panoply of diplomatic and economic levers must be employed to raise the costs of China's campaign. Economic sanctions can target key companies and officials; trade can be conditioned on significantly curbing cyberspying; and demonstrating the ability to penetrate Chinese military networks can impose costs on the Chinese.

Now that America's economic and financial affairs are deeply entangled with China's, mounting such a robust response may seem a daunting task. But the U.S. must begin by recognizing that the country is dealing with a hostile regime. China isn't an enemy out to destroy America, as is al Qaeda or the Islamic Republic of Iran; it is out to supplant the U.S. as the premier power on the world stage.

Had China sent military aircraft repeatedly into U.S. airspace, there would have been a swift and strong response from Washington. Had Chinese spies broken into U.S. office buildings and walked out with purloined documents, they would have been tried and punished. Instead, they did so in "cyberspace"—stealing on a scale mere burglars couldn't imagine.

China's cyber challenge won't end soon. The U.S. had better respond promptly, forcefully and creatively—and settle in for the long haul.

Cantata Sunday at Ruggles St.

"The Glorious Saviour," a Christmas Cantata by D. Stephen Cushman, minister of music and conductor, will be presented by the 70-voice adult choir of Ruggles Street Baptist Church on Sunday at 7:15 p.m.

D. STEPHEN CUSHMAN

The soloists will be Aletha Munro, soprano, and Lt Theodore W. Wu, formerly of Hong Kong, baritone. William Herzog III, compiler and author of the text, will give the narration. The performance is open to the public without charge.

Mr. Cushman, a member of the American Guild of Organists, is an organ recitalist, pianist and harpsichordist. He has been choral director and instructor of Musical History at Phillips Exeter Academy Summer School since 1956. A 1960 graduate of Harvard where he studied choral composition with Randall Thompson, he received his master's degree at the New England Conservatory of Music in 1962.

An English major at Harvard, Mr. Herzog wrote the drama, "Love Is Patient and Kind," which had its first performance on Nov. 29, at Ruggles Street Baptist Church.

WOMEN'S NEWS

Mrs. Frances Pollard
Editor

Mother, Sister Attend Rites In U.S.A.

The groom's mother and sister, Mrs. John Plett and Mrs. John French, respectively, travelled from Chilliwack to eastern United States to attend the wedding of Carolyn Janet Murch and Edelbert Gregory Plett.

Rev. Stanley Anderson and Rev. Kenneth Curtis officiated at the ceremony Oct. 1 in Calvary Baptist Church, Dorchester, Mass., for the daughter of Mr. and Mrs. Clarence E. Murch, Westwood, Mass., and the son of Mrs. Plett, Chilliwack, and the late John Plett.

Given in marriage by her father, the bride wore a gown of white bridal satin entrain trimmed with Alencon lace. An orange blossom crown held her below-the-shoulder-length veil. She carried a white orchid and stephanotis bouquet atop a Bible.

She was attended by her sister, Mrs. Joann Peterson; Mrs. Phyllis Meyers, Miss Arlene Fraser and Miss Eleanor Emerson as senior attendants and Laurel Peterson, her niece, as flower girl. They wore full - length empire gowns featuring ivory crepe skirts and cranberry velvet bodices. They carried red roses, pink carnations and white snapdragons.

A. Victor Plett, Moose Jaw, was his brother's best man. Ushers were William Smyth, Robert Solomon, Lt. Theodore Wu, and John Hansen.

Following a honeymoon by plane to Bermuda, Mr. and Mrs. Plett are residing at 1801 Riverside Dr., Ottawa, Ont.

Sep 1974 - Theodore Wu - married Marilyn Johnson

Full page : [HN00CV][GDrive]

MRS. THEODORE WAI WU

Miss Johnson, Mr. Wu are married in Boston

Pink carnations and ivory chrysanthemums decorated the altar at Park Street Congregational Church in Boston on Saturday afternoon, Sept. 7, when Marilyn Johnson became the bride of Theodore Wai Wu. The 4 o'clock ceremony was performed by Rev. Clifford Anderson, Rev. Paul E. Toms and Rev. Arnold Olsen and a reception followed in the Church Parlors.

The bride, daughter of Mr. and Mrs. Carl E. Johnson, Walpole, was escoted by her father. Her sister, Carol J. Lewin, Norfolk, was matron of honor. Bridesmaids were Ann Dwyer, Framingham; Barbara B. Frink, Wellesley; Ruth Brescia, Arlington; Gretchen LaRossa, Newton, and Gail St. Clair, Foxboro. Amy B. Lewin, Norfolk, was her aunt's flower girl.

Michael F. Brescia, Arlington, was best man for the bridegroom, who is the son of Mr. and Mrs. Joseph T. Wong, Los Angeles. Ushers included Lawrence Scott, Everett; Dr. William Peters, Arlington; Dr. James Small, Brighton; Dr. William Smyth, Watertown; Baldwin B. H. Soo-Hoo, Monterey Park, Calif.; Thomas Coperman, Falls Church, Va.; O. Bradley Latham, Reading, and Donald K. Yee, South San Gabriel, Calif.

The bride, a graduate of Lasell Junior Colllege, received her BS magna cum laude from Boston College School of Nursing. Her husband was graduated from the US Naval Academy at Annapolis and Boston University School of Law and attended Tufts University Graduate School of Arts and Sciences. He is an Assistant US Attorney for the Central District of California.

Mr. and Mrs. Wu will live in LaCanada, Calif.

Two Put on Probation in Safety Violations Case

Two officials of a Long Beach business that cleans petroleum product storage tanks were placed on four years' probation Monday on charges of violations of federal safety laws that resulted in the death of an employe.

U. S. Dist. Judge Warren J. Ferguson sentenced J. R. Dent, president of Crosby & Overton, Inc., and John Saenz, the vice president of the firm, both of whom had earlier pleaded no contest to the charges.

As a condition of probation, Ferguson ordered the company to implement a 14-point safety program drawn up by the government, including the addition of a full-time trained safety engineer.

The judge said he was rejecting a Probation Department recommendation that heavy fines also be levied on the two men and the company—which also pleaded no contest—because he would rather see their money go toward improving safety conditions.

The two men and the company were charged with failing to provide an appropriate air compressor to Jess Marinez while he was working in a naphtha storage tank at Douglas Oil Refining Co. in Paramount.

The compressor failed to work Aug. 8, 1973, cutting off Marinez' air supply and resulting in his death, according to Asst. U. S. Atty. Theodore Wai Wu.

Man Accused of Illegal Exporting of Missile Data

BY ROBERT RAWITCH
Times Staff Writer

The president of a Newport Beach aerospace manufacturing and engineering firm has been indicted by a federal grand jury on charges of illegally exporting to France technical assistance and data relating to the fabrication of materials having rocket and missile applications.

Vernon Edler, president of Edler Industries, Inc., was accused in the seven-count indictment of violating the Mutual Security Act of 1954 and making false statements to the State Department.

Asst. U.S. Atty. Theodore Wai Wu said the indictment culminates a year-long investigation by the U.S. Customs Service. The indictment alleges that Edler and the company made false statements in applications to the State Department for approval of two proposed agreements pertaining to the exportation of the data to France.

Edler Industries allegedly has participated in the manufacturing of nozzle assemblies and exit cones for various U.S. missiles, including the Minuteman and the Titan.

Edler, 56, if convicted, could be fined a maximum of $145,000 and receive a 20-year prison term. The company also could be fined up to $145,000.

Man Sentenced Over Illegal Exporting

Convicted of Giving French Data on Missile, Rocket Parts

BY ROBERT RAWITCH
Times Staff Writer

The president of a Newport Beach engineering firm was placed on five years' probation and ordered to spend 10 weekends in jail after his conviction of illegally exporting to France technical assistance and data relating to material that has rocket and missile applications.

U.S. Dist. Judge Manuel L. Real imposed the sentence on Vernon Edler, president of Edler Industries, after suspending a two-year prison sentence. As a condition of probation, Edler will have to devote 1,200 hours to charitable causes.

Edler, who once had U.S. State Department authorization to sell such data to France, lost that approval, yet continued to do business with the foreign nation, according to the government.

Edler Industries once participated in the manufacturing of nozzle assemblies and exit cones for various U.S. missiles, including the Minuteman and Titan.

Evidence at the trial revealed that between January, 1974, and April, 1975, the company's engineers and technical personnel went to France to provide technological assistance to a French company specializing in the research, development and manufacturing of missiles and rockets.

Company employes testified that during the same period, French engineers visited the Newport Beach plant on numerous occasions to discuss fabrication processes of components having applications to missiles and launch vehicles.

Without State Department approval, such discussions were allegedly in violation of the Mutual Security Act of 1954.

Prior to sentencing, Edler's attorney provided a letter to Real from the defense's chief expert witness contending that data passed along was common knowledge based on

open literature.

William Payne, a former Air Force officer and munitions expert, said in the letter that Edler Industries had "no capability for general structural design and analyses" of weapons' systems.

Although stating that other former defense contractors similarly might be exchanging data without State Department approval, Payne did not condone Edler's alleged actions.

Asst. U.S. Atty. Theodore Wai Wu did not respond in court to the letter, which was read silently by Real. But Wai Wu later said the government's expert witnesses disputed that the material passed along by Edler was common knowledge and of a harmless nature.

Real also fined Edler Industries $25,000 and placed the company on three year's probation.

Aerospace Executive To Work Out Penalty

LOS ANGELES (AP) – The president of an aerospace firm has been sentenced to 10 weekends in jail and ordered to perform 1,200 hours of charity work for illegally giving a French company technical assistance on rockets and missiles.

Vernon Edler Sr., 56, president of Edler Industries of Newport Beach, was given a two-year sentence Monday and placed on five years' probation. But U.S. District Court Judge Manuel Real suspended the term except for the weekends and charity work.

The judge also fined the company $25,000 and placed it on three years' probation.

Edler and his firm were convicted last month of five counts of illegal export in violation of the 1954 U.S. Mutual Security Act.

Asst. U.S. Atty. Theodore Wai Wu, who prosecuted the case, said company representatives provided technical assistance on lightweight and carbon material fabrication processes used in missile nozzle components to the Societe Europaene de Propulsion plant in Bordeaux, France. The prosecution said French engineers and technicians also visited Edler Industries to observe fabrication processes.

The government said that although Edler once had state-department approval to sell data to the French firm he continued to provide information through discussions in 1974 and 1975 after losing the permission without state-department approval those discussions violated the law, prosecutors said.

HOUSTON (AP) – A 5-week-old boy is recovering from injuries he suffered when a pet raccoon attacked him as he slept, his parents say.

Elmo Scott said officials at a local hospital described his son, Charles, as in fair condition Monday, a week after he was attacked in the bedroom of his grandmother's house.

"He had to get 86 stitches in his face alone," Scott said.

He said the raccoon, a pet belonging to a neighbor, apparently got in the back door and went to the bedroom where the infant slept. Scott said his brother-in-law, Charles Mullenix, went to investigate a "funny sound" and found the raccoon "all over" the baby.

Mullenix said he was bitten and scratched several times before he choked the animal to death.

Scott said the animal tore off the end of his son's nose, bit him all over the face, tore his lips and scratched him.

"We think his eyes will be okay," Scott said. "We're lucky there ... The doctors say he's improving faster than expected."

One source of worry was averted when tests showed that the raccoon did not carry rabies, Scott said.

Judge Dismisses Indictment of Millionaire on Charges of Securities, Mail Fraud

BY ROBERT RAWITCH
Times Staff Writer

Securities and mail fraud charges against millionaire Peter Traynor were dismissed Wednesday by a Los Angeles federal judge, who ruled Traynor's indictment had not been issued by a sufficient number of "informed" grand jurors.

U.S. Dist. Court Judge Harry Pregerson's 13-page opinion said he was dismissing the charges against Traynor, his associate William G. McDonald and Traynor's corporations "to preserve the integrity of the grand jury system."

Traynor, who made his fortune in the insurance industry and then turned to making motion pictures, was indicted earlier this year for allegedly making false promises in promoting the sale of $5 million in limited partnerships in his movie production companies.

The essence of the judge's ruling was that at least 12 federal grand jurors must be present and hear all the evidence presented against a potential defendant before a grand juror can be considered "informed."

In Traynor's case, although 19 jurors voted to indict him and his codefendants, only nine had been present at all the preceding grand jury sessions in which testimony was presented.

Because the indictment was dismissed without prejudice, federal prosecutors have the right to bring the case before a new grand jury in an effort to recharge Traynor, McDonald and Traynor's corporations, Leverage Funding Systems, Inc., and Centaur Film.

Asst. U.S. Atty. Theodore Wai Wu, who handled the case, said no decision has been reached on whether Pregerson's ruling will be appealed or whether the case will be represented to a new grand jury.

No matter what action is taken by the government, defense attorney Richard Kirschner said the judge's decision must be seen as "making inroads into the grand jury system in this district and creating a fairer system than exists in the state courts."

Pregerson in his opinion wrote:

"If grand jurors were told that their ability to cast a valid vote on an indictment hinges on their faithful attendance, then perhaps they would take their duties more seriously and appear in all sessions.

"It is not asking too much to require the faithful attendance of at least 12 out of 23 members of a constitutionally mandated body exercising great power over peoples' lives. To demand less casts a disparaging light on the grand jury as an institution and endorses an appearance of unfairness which has no place in our system of criminal justice."

At another point, Pregerson said there is perhaps "a significant gap" between the historic role of the grand jury and the role currently fulfilled by grand juries.

"Of necessity," Pregerson said, "the grand jury must rely on the evidence presented to it by the prosecutor.

Los Angeles Times Thurs., Oct. 18, 1979—Part II 5

Nevertheless, the grand jury has an important role to play, particularly at the federal level, where the grand jury is the only potentially neutral body that can protect the individual against the initiation of arbitrary or malevolent prosecutions.

"If such a prosecution is started, the innocent may be forced to suffer the serious economic and social harms resulting from the return of the indictment itself."

Though Pregerson's ruling is not binding on any other case, it appeared to suggest he is likely to dismiss an indictment against five reputed organized-crime figures, who similarly have challenged the quorum of grand jurors against them.

In that case, attorneys for the Justice Department's Organized Crime Strike Force gave jurors the opportunity to read transcripts of the testimony they missed.

In Pregerson's opinion on the Traynor case, however, the judge noted that a person is not an "informed" grand juror even if he reads the transcripts of missed sessions.

2 Arrested, 2 Still Sought In Sale Of Electronic Goods To Soviet Bloc

Associated Press

LOS ANGELES — Two persons have been arrested on charges of selling bugging devices and other strategic technology for shipment to the Soviet Union.

The arrests were made Wednesday, shortly before those two and two other persons were charged in a 60-count indictment handed up by a federal grand jury in Los Angeles.

Arrested were Anatoli Maluta, 61, a Soviet-born U.S. citizen who lives in Redondo Beach, and Sabina Dorn Tittel, 31, of Rancho Palos Verdes. Assistant U.S. Attorney Theodore Wu said they would be arraigned Monday. Both were held in lieu of $800,000 bail.

Still being sought are Werner Bruchhausen, 42, of West Germany, and Dietmar Ulrichshofer, 41, of Austria. "They're overseas for sure," said Alan Walls, deputy regional director of U.S. Customs. Authorities indicated they were probably in Europe.

Neither Walls nor Wu would say how the case was broken, although Walls said the investigation began 18 months ago. Walls said West German authorities cooperated.

"We're talking of a suspected $8 million worth of strategic technology," he said. "We can document and prove approximately $2 million and have a good indication of the remaining $6 million."

Walls said exporting such technology illegally is common: "It's also common that . . . it is exported to friendly countries and then diverted to hostile countries. It's difficult (to prove intent) but it's possible and we think we have," he said.

The indictment charged that during 3½ years ending in June 1980, the four conspired to ship strategic technology to West Germany and elsewhere without obtaining U.S. export licenses.

Maluta, Bruchhausen and Ulrichshofer were accused of exporting electronic monitoring and communications systems, computer components, semiconductors, manufacturing and testing equipment.

Maluta and Ms. Tittel allegedly told their employees to tell manufacturers the items were being purchased for Maluta's security business and facilities in Arizona and Alaska, officials said.

Bruchhausen owns and controls six California technology corporations and two West German corporations. Maluta, an officer and director, controlled the daily operations of the six California firms.

Named as an unindicted coconspirator was Hans Koenig, a West German and owner of a company called Elmasch, which allegedly sold high technology products from the United States to Soviet-bloc countries.

Silicon Valley new target for spies

Los Angeles Times

LOS ANGELES—Foreign intelligence efforts in the United States have shifted from Air Force bases and military targets to the fortresses of U.S. technology, say specialists in counterintelligence, electronics and law enforcement.

They say foreign agents operate here in surprisingly large numbers, and several FBI sources estimate there may be 30 Soviet KGB agents working in Northern California alone.

The agents' targets are the assembly plants that make up the heartland of the U.S. microelectronics industry—the "Silicon Valley" of Santa Clara County, Calif.

The arrests last week in Los Angeles of a suspected Polish intelligence officer and a Hughes Aircraft Co. radar engineer show the extent of the foreign powers' determination to compromise the security of aerospace and electronics firms.

The American engineer, now cooperating with the FBI, said he was paid more than $110,000 by Polish agents for technical documents that described projects Hughes planned to sell the U.S. government.

The military implications are clear for the "covert, all-weather guns systems"—the subject of one of the Hughes documents apparently acquired by the Poles. But counterintelligence and electronics specialists say national security may be even more damaged by espionage in electronics and other technological fields.

The United States has a clear international edge in microelectronics, surpassing even the Japanese in such revolutionary technologies as integrated circuits, bubble memory and other exotic computer-related fields.

Star Illustration by Kent MacIntosh

Technical superiority

But that edge is fragile. The kind of knowledge and technical data—even the memory chips and other electronics parts themselves—are extremely portable and are as useful to an enemy as they are to the United States.

Theodore Wai Wu, a Naval Academy graduate, is an assistant U.S. attorney in Los Angeles. He has prosecuted a number of cases involving the illegal transfer of technology to the Soviet bloc.

Wu said the public record is filled with evidence that U.S. military policy is based in large part on the presumption that this country has wide technical superiority over the Soviets.

"But what should happen if it turns out that our edge is not as wide as we believed?" Wu asked.

The United States has attempted in the past decade to control the spread of technology. In response, the Soviets and their allies have concentrated their intelligence gathering in the Silicon Valley, Los Angeles and other areas where the electronics industry has grown.

Soviet agents are in the market for technical information and for the manufacturing equipment needed to develop their electronics capability.

But they also are involved in the purchase through phony corporations of everything from simple parts to highly sophisticated electronics components. These materials are shipped and reshipped, sometimes with the knowledge of their U.S. manufacturers, to disguise their ultimate destination—the Soviet bloc.

The cooperation of so-called "legitimate" electronics businessmen is necessary for this traffic to continue, investigators contend.

Technology transfer

"Some of them are a hell of a lot more interested in a sale than they are in their country's security," said one U.S. customs investigator in San Pedro, Calif. "They don't care who they are selling to. A sale is a sale."

Customs officials say 40 international shipments have been seized at Los Angeles International Airport and at the harbor in the past year. Besides machine-gun parts and other munitions, the seized material included computer parts and components for a missile guidance system.

Agencies ranging from the Santa Clara County sheriff's office to the FBI and CIA are involved in investigating crimes involving "technology transfer."

The wizards of the Silicon Valley have learned to reduce entire computers to intricate layered pieces of glass that can store and sort hundreds of thousands of bits of binary information in billionths of a second. The military and industrial applications of such advances are manifold.

One of the most recent inquiries into such allegedly illicit traffic involves the "Continental Technology Corp.," under investigation by a Los Angeles federal grand jury.

No indictments have been issued in the investigation, which involves about a dozen alleged shell ized U.S. citizen born in Russia, and Werner J. Bruchausen of Neiderseeon, West Germany.

The documents—including an affidavit prepared by Santa Clara County Deputy Sheriff Wayne Brown—state the two men figure in stolen electronics parts trafficking.

A variety of sources say the federal investigation is more concerned, however, with the international movement of complete electronics systems, some of which are believed to have been smuggled out of the country.

Hidden destinations

Maluta once worked for U.S. Air Force intelligence. He referred questions about the investigation to his attorney, Carl Capozzola of Torrance, Calif., who said his client is willing to cooperate with federal investigators.

As is sometimes the practice of shipping firms attempting to evade the U.S. embargo on high-technology exports to Russia, Continental Technology shipped proscribed equipment through non-Soviet bloc countries to conceal its real destination, investigators said.

In addition to such transshipping, however, the Continental investigation has shown evidence of more sophisticated schemes. One source familiar with the investigation said electronics components, which could not be legally exported, were wired into mundane electronics equipment and shipped under disguise.

U.S. investigators went to West Germany last month to expand their probe, according to sources. The U.S. Commerce Department has suspended the export privileges of Maluta, Bruchausen, another corporate officer and three of Bruchausen's West German electronics firms.

However, investigators doubt the German will be prosecuted here because the U.S.-West German extradition treaty does not extend to export law violations.

A classic example of that problem involves Volker Nast of Hamburg, West Germany, who played a key role in a 1975 scheme to smuggle electronics gear to Moscow. Customs investigators said Nast and his colleagues have direct ties to an East German-Russian spy ring that specializes in obtaining electronics parts.

Illegal exports

Nast and five other men, including three Americans, were indicted in San Francisco for conspiring to export several tons of electronics equipment to Russia.

The equipment included not only components but machines such as "wafer scrubbers" used in the manufacture of integrated circuits.

"This stuff could never have been exported to Russia legally," said John Lockie, a Washington attorney and former federal prosecutor in San Francisco.

Lockie said federal authorities were alerted to the ring's operation six tons of sand bags were put into the packing crates in its place. The shipment was resealed and put aboard a freighter for Hamburg.

Nast met the shipment in Hamburg, investigators said, arranged to have the goods forwarded to East Germany and then to Moscow.

The 1975 incident resulted in the conviction of three American electronics executives for violations of the export laws. But the three Germans indicted, including Nast, were not brought to trial.

Nast, however, was not heard from again until this year, when customs investigators on the East Coast launched another probe into an apparent Eastern bloc attempt to obtain sensitive electronics equipment.

The target this time was a microwave receiver called an MSR-903, manufactured by the Micro-Tel Corp. of Baltimore. The device can be used to monitor satellite transmissions and has been sought by Soviet and Czech agents since 1972, the FBI said.

Tracking smugglers

The machine in question was ordered in 1980 by a U.S. businessman who requested certain modifications in the $49,000 unit.

Because the businessman told Micro-Tel officials he was ordering it for a colleague in Europe, the company notified customs investigators.

When they found that no export license had been secured for the machine, they suspected smuggling.

Agents bugged the machine with a radio-tracking beacon, according to William Mason, customs agent in charge of the investigation, which began in Trenton, N.J.

Three days after delivery, customs agents arrested a German engineering student, Rolf Peter Herms, 36, at Kennedy Airport in New York, trying to check the receiver, hidden in a large suitcase, aboard a flight to Frankfurt.

Herms, who later pleaded guilty to export violations, said he had been hired by Nast to smuggle the MSR-903 out of the United States.

Nast was indicted May 26 for conspiracy to violate U.S. munitions control laws, because the receiver is so specialized it is considered an article of war.

The coincidence of Nast's involvement in two different electronics prosecutions is not unusual. There is, according to investigators, a relatively tight international network of electronics-parts traffickers operating on the fringes of the legitimate business.

In fact, according to Northern California investigators, individuals suspected of transshipping electronics components to the Soviet Union also are alleged to be involved in a large-scale, lucrative international black market in stolen electronics parts.

Documents filed in several California courts by Santa Clara County officials show that both Maluta and Bruchausen, under investigation in the Continental Technology case, also figure in a series of criminal cases arising from the theft of memory chips from Intel Corp. and other Silicon Valley manufacturers.

An affidavit by Santa Clara Deputy Brown, filed in support of search warrants for Maluta's home and other buildings in Los Angeles, traces a kind of electronics parts pipeline that stretches from the Silicon Valley across the Atlantic to Europe and perhaps behind the Iron Curtain.

Brown said informants have told him some electronics middlemen regularly pay hundreds of thousands of dollars for parts, knowing they are stolen.

One such deal took place in Anaheim, Calif., when, an informant reportedly told Brown, a dealer paid more than $385,000 for a trunk load of stolen memory chips.

International market

The informant, identified by Brown as John Henry Jackson of Sunnyvale, Calif., and several other of Brown's sources named a number of the electronics dealers involved in this black market. Among those named were Maluta and Bruchausen.

While the affidavit in state court does not concern itself with the federal crimes involved with illegal export of electronics parts, Brown said in a recent interview he believes parts stolen in the Silicon Valley can be sent as easily to Soviet bloc countries as they are being sent to Western Europe.

The connection between the international market for stolen electronics parts and technology transfer to the Soviet Union is, however, by no means clear.

Some electronics experts doubt that any connection exists. They argue the Soviets already have developed enough manufacturing capability that they no longer need parts from the United States.

But other experts say there is evidence the Soviet electronics industry is based in large part on components copied directly from U.S. designs. These components would be compatible with U.S. parts, the experts say.

Evidence of that was found recently when intelligence analysts recovered a Soviet SAM 6 missile, which incorporates what is described as a "carbon copy" of an Intel 8080 microprocessor.

Intel Corp. officials, amazed at the faithfulness of the copy, said it would be perfectly compatible with other Intel parts and there was "absolutely no reason" why the Soviets would not be using the device with stolen U.S. parts.

U.S. seizes three high-speed boats

WASHINGTON (AP) — U.S. officials said Friday they seized three high-speed patrol boats headed for Nicaragua and that the Sandinista government had intended to use them to spy against its Central American neighbors.

The crafts, produced by a U.S. company, were equipped with high-performance engines and sophisticated electronic gear, said Theodore W. Wu, deputy assistant secretary for export enforcement at the Commerce Department.

Diversion of helicopters investigated by government

80 U.S. aircraft received by North Korea, officials claim

WASHINGTON (AP) — The Commerce Department says it has evidence that a West German exporter engineered the diversion of more than 80 U.S. helicopters to communist North Korea — aircraft similar to those provided to South Korea for its defense.

Theodore Wu, deputy assistant secretary of commerce for export enforcement, said Sunday that the diversion of the Hughes model 300 and 500 helicopters was "probably the largest illegal diversion of U.S.-manufactured aircraft" known. He said the aircraft would be enough "to give close air-to-ground support for a whole regiment of troops."

Customs and Commerce Department agents armed with search warrants seized documents Friday from two Los Angeles-area freight companies that Wu said were allegedly involved in packing and forwarding some of the helicopters.

Also on Friday, the department revoked the export licenses of two West German companies, an official of one of the firms and eight related parties, most of them in the Los Angeles area, making it illegal for anyone to deal with them in transactions involving goods of U.S. origin.

Wu said the evidence indicates that Kurt Behrens, managing director of Dela-Avia Fluggerate Gmbh., had ordered at least 85 helicopters from Hughes for delivery in 1983 and 1984, and at least 80 of the craft were delivered, ostensibly to Behrens in West Germany.

But Wu said the department's information shows the ultimate destination of the helicopters was North Korea.

He said, for example, that the latest shipment, involving 15 helicopters and repair parts, was shipped from Los Angeles on a Panamanian-flag vessel, the Westwood Merchant. They were unloaded in Antwerp, Belgium, trucked 75 miles north to Rotterdam, the Netherlands, and put on a Soviet vessel, the Prorokov. The ship was ostensibly bound for Hong Kong, but the helicopters apparently went instead to North Korea, said Wu.

Another shipment, in 1983, went from Los Angeles to Japan before being diverted to North Korea, he said.

Wu said there is no information so far to indicate that Hughes Helicopter, based in the Los Angeles suburb of Culver City, knew anything about the scheme. "The company is cooperating with the Commerce Department" in its further investigation with the Justice Department, said Wu.

But he said documents indicate that the traders who filed export papers with the U.S. government concerning the transactions "had reason to know, or in fact knew, that the 'copters were not going to West Germany but were intended for North Korea."

According to the authoritative reference book Jane's All the World's Aircraft, military versions of the model 500 helicopter are capable of carrying anti-tank rockets and machine guns.

The book says South Korea has for several years been building military versions of the model 500 for its air force from U.S.-supplied components. By 1980, the country had more than 100 such helicopters, according to Jane's.

The "related parties" denied U.S. export privileges, he said, were Associated Air Services of Van Nuys, Calif.; National Helicopter Service and Engineering, Van Nuys; Associated Industries, North Hollywood; Spedition Killewald Exportrans Gmbh, Berlin; Arnold A. Semler, Studio City, Calif., and a company bearing his name; Ronald H. Semler, identified as general manager of Associated Industries; and Monte Barry Semler, identified as Associated's director of international marketing.

North Korea got US-built 'copters

WASHINGTON (AP) – North Korea has received more than 80 U.S.-built helicopters – similar to military models provided to South Korea – through a West German exporter who allegedly diverted them there illegally, the Commerce Department says.

Commerce's deputy assistant secretary for export enforcement, Theodore Wu, said the aircraft, if modified for military use, would be enough "to give close air-to-ground support for a whole regiment of troops."

The transactions involving Hughes model 300 and 500 helicopters "is probably the largest illegal diversion of U.S.-manufactured aircraft, of helicopters, that we know of," Wu said in a telephone interview.

U.S. policy provides for an embargo against any goods being shipped to North Korea, with the sole exception of non-commercial quantities of humanitarian items.

On Friday, Customs and Commerce Department agents armed with search warrants seized documents from two Los Angeles-area freight companies that Wu said were allegedly involved in packing and forwarding some of the helicopters. He identified the companies as Unitrans International Corp. in Inglewood and Associated Industries in North Hollywood.

Also on Friday, the department revoked the export licenses of two West German companies, an official of one of the firms and eight related parties, most of them in the Los Angeles area. That step made it illegal for anyone to deal with them in transactions involving goods of U.S. origin, Wu said.

Wu said the evidence indicates that Kurt Behrens, managing director of Dela-Avia Fluggerate Gmbh., had ordered at least 85 helicopters from Hughes for delivery in 1983 and 1984, and at least 80 of the craft were delivered.

But instead of going to Behrens in West Germany, the helicopters were shipped to North Korea, he said.

California businessmen fined for alleged export conspiracy

SAN JOSE — The U.S. Commerce Department has fined the head of a Silicon Valley company and a Redondo Beach businessman a total of $450,000 for allegedly conspiring to illegally export silicon chip-making equipment to Czechoslovakia.

The Commerce Department charged that William Dart, head of Santa Clara-based Display Systems, and Josef Kubicek, president of Exclusitrade Inc. of Redondo Beach, conspired in June 1983 to export to Czechoslovakia without a license two wafer-polishing devices used in the manufacture of semiconductors.

The equipment was seized by customs officers before it could be shipped to Czechoslovakia.

The machines have no direct military applications, but certain types cannot be exported to Eastern bloc countries because they could be used to manufacture semiconductors used in computer and electronic systems with military uses, said export enforcement officer Theodore Wu.

Fines of $300,000 against Kubicek and $150,000 against Dart were announced last week by the Commerce Department's Export Enforcement Office in San Jose.

Dart on Friday said he and Kubicek plan to appeal the matter to federal court.

Export bar for Santa Clara firm

US suspects restricted high-tech equipment was sent to Bulgaria

Los Angeles Times

WASHINGTON — The Commerce Department Monday denied a California businessman export privileges for 60 days, saying it has reason to believe that his Santa Clara company has illegally exported high-technology goods to Bulgaria.

Theodore W. Wu, deputy assistant secretary for export enforcement at the Commerce Department, said the action against Anthony Speno and his business, Valley Machine & Tool, followed a Dec. 12 search of the company by department agents.

As a result of the search, Wu said, the department "has reason to believe" that the company "currently has in its possession various high-technology goods which may also be intended for export to Bulgaria," including computer disk manufacturing equipment.

"The department moved to impose this order as a preventive measure while the investigation is in progress," he added.

Federal export regulations require special licenses to export certain high-technology equipment from the United States to other countries and bar the export of certain products to Eastern bloc nations.

According to an affidavit signed by the special agent, a search warrant was obtained for company offices to determine whether it had illegally exported to Bulgaria equipment used to manufacture 2-inch to 14-inch disks.

The equipment, known as surface enhancement systems, had been produced by AYE-ZED, a San Jose company that is now bankrupt, the agent said. Bruce E. Colegrove, former owner of AYE-ZED, told an investigator that he had been hired by Speno to refurbish some of the equipment.

While working at the company's Santa Clara facilities, Colegrove told the investigator, he overheard a conversation between Speno and another unidentified person that indicated the machines were going to F.T.O. Technika in Sofia, Bulgaria. Colegrove said that he ended his contract with Valley Machine & Tool last March after the company failed to pay him. In October, when Colegrove returned for payment, only one of the refurbished machines still remained in Santa Clara, he said.

A further check, the investigator said, revealed that the company made about 10 export shipments to Bulgaria within the last year via Union Air Transport, a freight forwarder in Burlingame, which arranged for delivery of the commodities directly to an ocean shipping line.

The forwarder said that Valley Machine & Tool listed the shipments as containing general industrial equipment, or electronic and precision instruments, commodities that may be shipped to Eastern bloc countries.

The Los Angeles Times (L... • 16 Dec 1999, Thu •

WU, Mabel Lee, 91, Glendale, California, on Saturday, December 11, 1999, at Verdugo Hills Hospital. Loving mother of Carolyn C. Lu and Theodore W. Wu, Jr.; also survived by son-in-law, Eddie Lu and daughter-in-law, Marilyn J. Wu; 4 grandsons, Derek, Daryl and Douglas Lu, and Theodora Joshua Wu. Outgoing and caring, she loved her family and friends, enjoyed music and traveling.

Services will be held at the Wee Kirk Chapel, Forest Lawn-Glendale, Sat., 11:30am, Dec. 18, interment to follow at Forest Lawn.

In lieu of flowers, memorial contributions may be made to the Foothill Service Club for the Blind, 117 E. Los Feliz Blvd., Glendale, CA. 91205.

She is now rejoicing with the Heavenly Father and her Savior, Christ the Lord.

Mention of Olmer

[...]

A letter, dated October 30, was sent to the committee chairman by Deputy Assistant Customs Commissioner William Green, and he did not mince his words. The letter, which was to become known as the Green_Memo, was damming. It accused the Commerce Department of impeding cooperation in investigations, compromising customs and foreign government sources, and damaging Customs relationships with the allies. The Commerce Department, said the Green Memo, had contributed to problems affecting the national security.

The Department of Commerce hit back. It claimed that Customs had not always responded with help when needed, that it had initiated its own investigations without telling Commerce, and that if Customs seized shipments without proper technical knowledge to support those seizures it would be harassing legitimate exporters. Commerce stressed that all export control enforcement should be under one agency- the Commerce Department's Compliance Division, where controls were a priority. Customs was responsible for enforcing a number of laws, and its priorities were constantly being reassessed. (30)

Accusation and counter-accusation continued as, during the next few years, Congress became increasingly involved. The criticism from each side was bitter, but the most damning of all for Commerce came in May 1982, after an eighteen-month investigation by Senate staff members into the behavior of the Compliance Division. One special agent employed in the Compliance Division, who had served more than twenty years as a criminal investigator, told Senate staff that "the Kremlin's spy organization, the KGB, could not have organized tho Compliance Division in a way more beneficial to Soviet interests." (31)

The Senate investigators demolished the Commerce Department's claims that tho Con1pliunce Division was competent. "Our investigation found that ... it is an understaffed, poorly equipped, and in certain instances under-trained and unqualified investigative and intelligence unit." How could it carry out its function when it was overwhelmed with work? The division did not even have a "secure" telephone. Everyone knew about the problems, the Senate staff member told his committee; it was one of the worst kept secrets in the Executive Branch. But he had found no one who would come forward and tell the truth. "The highest leaders of our nation are led to believe that we have an export control capability when, in fact we don't." (32)

Most shocking of all to the assembled senators was a revelation by a former Compliance Division investigator that he was the only person responsible for ensuring that companies adhered to former President Carter's embargo on grain sales to the Soviet Union after the invasion of Afghanistan. Senator Sam Nunn of Georgia, a member of the Committee on Governmental Affairs, remarked; "So you have a major decision by the President of the United States on a major foreign policy issue involving the United States and the Soviet Union, involving all our allies, involving the credibility of our foreign policy and economic policy throughout the world, and you have the Commerce Department assigning one individual for enforcement purposes." Senator Nunn, who later introduced legislation to amend the Export Administration Act and transfer criminal enforcement from Commerce to Customs, said, "When [President Reagan] starts talking about the export of technical equipment that aids the Soviet Union, nobody tells him that they have eight inspectors covering all the airports and ports of the country in enforcing the Export Administration Act, do they?"(33)

The investigation met with resistance by government departments. Working agents and senior officials were candid - but insisted on anonymity. Both the FBI and the Justice Department refused to help evaluate Commerce, although there was a widespread sense throughout the affected areas of government that the Compliance Division was inadequate. Senator Nunn remarked: "So the attitude generally is what the President of the United States doesn't know about the inability of the Commerce Department to carry out his own policy doesnt hurt him, right? What the Congress doesn't know doesn't hurt them?" (34) Reports on the Commerce Departments relations with the Intelligence community were just as damming. The Senate investigation found intelligence on technology transfer to be insufficient, a commitment of, needed resources lacking, and the Intelligence community not organized to use information to block prohibited transfers. Intelligence sources told the Senate investigators that they had "virtually no communication with ... Compliance regarding ongoing investigations... There is a little feedback from Commerce regarding intelligence information it provides ... Compliance ... rarely seeks the expertise of the intelligence community. " (35)

The friction between Commerce s Compliance Division and the Customs Service eventually led to scarcely credible behavior by government officials. "Customs is doing its thing ... Commerce is doing its thing... and nobody is happy and it is costing the taxpayer over thirty million dollars," remarked Representative Don Bonker of Washington State, sponsor of the House version of the bill to amend the Export Administration Act. (36)

At the receiving end of the attack, Lawrence Brady did not flinch. The official who had said export administration was a "total shambles" was unswerving in his belief that Commerce should be the major body for enforcement of the Export Administration Act at home and abroad. In February 1983, he told skeptical senators that significant strides had been taken in correcting the deficiencies that had built up during the seventies. He now believed Commerce to be the equal of Customs in most respects. The Intelligence agencies had been asked to prepare current analyses of Soviet acquisition targets and methods: these were being read ·regularly by Brady and his staff. Budget and manpower had been increased; for the first time technical people were being hired as licensing officers. Commerce officials were being educated in how to use the control list, prepare license applications, and examine various licenses. Thirty-five highly trained criminal investigators had been hired, and a third of a million dollars had been spent on state-of-the-art surveillance equipment. (37)

But the main change was that a **new Commerce Department office** had been created. The much-criticized Compliance Division has been upgraded to office status. **To head the new and expanded Office of Export Enforcement, Lawrence Brady had brought on board one of.the West Coast's most renowned attorneys in the technology-transfer field, the man who had prosecuted three well-known cases** (38). **Theodore Wai Wu** was an assistant U.S. attorney in Los Angeles**, where he was assistant chief of the Criminal Division and senior trial attorney for Customs and export control violations**. Wu was not unpopular with the Customs agents with whom he had been in close contact during high-tech investigations, although had said, "He tended to get overenthusiastic." The story the agent told took place during one of the trials on technology transfer.

"He kept jumping up and down and shouting 'Objection! Objection!' The judge kept saying, 'Sustained.' At one point, Wu jumped up and shouted, 'Sustained!' 'That's my line, Mr. Wu,' the judge told him." (39)

Customs agents found him knowledgeable about technology; they admired that. And he was good at explaining technological complexities to juries. Wu was a graduate of the U.S. Naval Academy and had served on active duty in weapon and engineering assignments. He had done graduate work at Tufts University and got a J.D. at Boston University Law School.

Like Bob Cozzolina, Ted Wu believed that the first line of defense in controlling technology transfer was the private sector. "Tip-offs are critical. We rely on industry to give us leads." (40) Each of the cases he had prosecuted had been a result of information from industry. **One of Ted Wu's main assets was the Commerce Department's newly acquired IBM 370 computer, storing the 300,000 existing export licenses and all the new applications**. It had on-line tracking for all cases to proscribed destinations and details of computer exports to Western countries. It was to be upgraded throughout 1983 to store intelligence information and details on the foreign availability of technology. Accessible from the West Coast and New York, with eventual expansion to forty-seven cities, it would enable local investigators to check both destinations and users. **Lionel Olmer, Under Secretary of Commerce for International Trade**, told Congress in February 1983 that information in the computer would provide valuable help for the FBI, the CIA, and the Customs Service.

But the stronger the enforcement capabilities at Commerce, the more intense became the rivalry with Customs. At the heart of the dispute was the information stored on Ted Wu's computer. Customs agents complained that they were being denied access to the wealth of information in those memory banks, and this was hampering their investigations. Commerce officials were willing to give them details only on a case-by-case basis. Congress became aware of the problem in the spring of 1983. Under Secretary Olmer claimed at Senate hearings that a memorandum of understanding on sharing the information was about to be signed. However, it was a couple of months late getting off the ground.

"I understand you are negotiating the size of the table", said a senator.

"No, I don't think so," replied Olmer. "I'm not looking for a Nobel Peace Prize."

He was told it might be worth it.

"I do not believe there are any serious issues between us that would prevent us from getting a memorandum ... signed within the next week or so," replied Olmer. But he went on: "We've been criticzed ... for not giving ... Customs... information from the private sector which !s given to us in the course of ... applications for export .... There is an awful lot of proprietary information ... and we are simply not prepared to let it go without some understanding." (42)

At the center of the controversy was a clause in the Export Administration Act that protected proprietary commercial information obtained by Commerce. Customs Commissioner von Raab told Congress that the computer was closed to his agents because "apparently it contains some business confidential information." He said the use to which he might put the information would not cause problems. The State Department, after all, opened its files, and the Justice Department had, in fact, ruled that information that might be closed to the public was not closed to government agencies. Now, the Commerce Secretary had ruled that the information be made available; it was junior officials who were refusing to supply the data on anything other than a case-by-case basis. (43) Congress was told that the refusal by Commerce to open its files was unique to the Reagan administration. Theodore L. Thau, who from 1961 to 1972, was executive secretary of the Ex port control Administration Review Board in charge of the legal aspects of export control enforcement, had shared information with other government agencies. Thau was "surprised and shocked" that for the first time since 1949, when the act's confidentiality prrovision was adopted, the question of sharing information had arisen. (44)

The Exodus team became desperate for the licensing details. Aft shipments were seized at ports of exit, the Washington Command Center was obliged to wait until Commerce officials told them the licensing status of the equipment: the fact that copies of licenses were not included with shippers' export declarations infuriated them. Commissioner von Raab did not hesitate to express their concern. He told Congress that to speed the work of his team he did not need validated licenses with shipments; just photocopies. Twice a day one of his agents was obliged to walk across Washington's 14th Street from Treasury to Commerce, carrying details of the shipments seized by his team. "Commerce then decides what to do with the detentions," he said. (45)

The United Nations Treaty Series Project - By PETER H. ROHN UNIVERSITY OF WASHINGTON

[...]

1963. The United Nations Treaty Series Project (UNTS Project) started as a vague hunch in a class discussion. The question was how to prove the growth of international institutions in conventional international law. The answer was simple in theory but difficult in practice. We should survey the texts of treaties. If references to international institutions increased, the point was proved; otherwise, disproved. The more treaties we surveyed the more reliable the results would be. There was no money to pay for anything, no special equipment, no extra work space, nothing but the idea and the library and a group of students volunteering to do the job as part of their classwork in international law.

Two months later, some fifty students had combed through all volumes of the United Nations Treaty Series (UNTS). There were 426 volumes in the autumn of 1963. A few key characteristics were extracted from every one of the 6,734 treaties published up to that time in the UNTS. The students coded these key characteristics on dittoed code sheets. By Christmas I had on my desk a pile of several hundred code sheets filled out by 50 students in as many handwritings. I had no way of guessing the level of accuracy and completeness, let alone usefulness, of the whole exercise.

[...][page 178][...]

Also in 1965, the UNTS Project became part of the regular graduate instruction in international law at the University of Washington. A system was developed (and is still in force) whereby seminar students must combine traditional and quantitative methods in international law. Standard procedures include the handling of UNTS Project printouts, code manuals, and raw data cards. Students also use auxiliary equipment in the computer center as well as desk calculators and other simple devices for minor individual tasks. Measurements and computer-oriented activities must be related to traditional research wherever possible.

1966. This year saw a gradual shift of emphasis from investment to production. Data enlargement continued by adding identifications of international organizations referred to in treaty texts and identity of registering party, as well as some refinements in the 1965 topic code. The second annual updating was completed in June by adding to the data bank UNTS Volumes 454-503 published between June 1965 and June 1966. Data enlargement and updating having become a routine function of an on-going operation, the main thrust of the work in 1966 concerned new programs for the machine-handling of UNTS data, and analytic work in selected aspects of the law of treaties. Completed were the study of the Canadian UNTS Gap," a special study on the role of military matters in the world's treaty pattern,[12] a general statement of theoretical under- pinnings for the UNTS Project, [13] a paper on information retrieval aspects of the UNTS Project, [14] and an outline of a more general scheme of computerizing international law. [15]

Two professional meetings on the use of computers in international relations research included the UNTS Project: (1) the special working group on electronic data processing set up by the American Society of International Law; [16] and (2) the Institute on "Computers and the Policy-Making Community" sponsored by the Endowment for International Peace and the U. S. Atomic Energy Commission. [17]

Also in 1966, two graduate student papers on UNTS Project material attracted professional interest: (1) one paper was selected for presentation to a West Coast regional conference [I8] and was then revised and published elsewhere; [19] and (2) the other paper was chosen for presentation to the University of Washington Student International Law Society and then also published elsewhere. [20] By the end of 1966, a total of 15 students found their work referred to by name in UNTS Project publications,[21] and 8 of them more than once. [22]

Finally, the UNTS Project was given a broader institutional base at the University of Washington through the appointment of a joint advisory committee by the Dean of the Law School and the Chairman of the Political Science Department.

1967. Three new sets of data were added in 1967: (1) date of effect, (2) date of registration and (3) official languages. New work began on multilateral treaties and on treaty history subsequent to registration, e.g. prolongations, terminations, accessions, withdrawals, amendments, and reservations. The annual updating proceeded concurrently with the addition of new data. UNTS Volumes 504-550 were coded. This brought our data bank up to date, covering all UNTS volumes published through December 1967.

The computer center started developing for the UNTS Project a teletype capacity for instant retrieval between the UNTS Project office and the computer center. This is being done by means of the B-5500 XTAB retrieval program adapted by the computer center of the University of Washington especially to the needs of the UNTS Project. It will be used in addition to the existing capacity of the IBM-7094 for both retrieval and computation. The B-5500 program plus teletype response will cut the waste and the waiting time involved in using the IBM-7094 (or later the IBM-360) for simple retrieval jobs. **[23][Grateful recognition for imaginative help far beyond routine cooperation is made to the two co-directors of the computer center at the University of Washington, David Dekker and Carl Young, and to the following staff members in particular: Charlene Haug, Elton Hay, Larry Menninga and Monique Rona.]** Hunches can then be tested in minutes rather than days. Retrieval also has become a somewhat larger part of UNTS Project operations as more faculty and graduate students use our data bank and as more requests for special data printouts are received from outside. [24] [...]

1968 (August 14) -Co-founder of a new company - Computer Center Corporation

Computer Firm Formed

A new computer firm, the Computer Center Corp., has been formed by four University of Washington specialists, it was announced today.

Carl G. Young, director of operations at the university's computer center since 1965, has resigned to become president of the new company, which will specialize in service to scientific firms and industries on a time-sharing basis.

Quarters have been leased in the former Dresslar-Waesche Building at 4057 Roosevelt Way N. E.

Dr. David B. Dekker, who has been faculty director of the University Computer Center since its establishment, is vice president of the new firm.

DEKKER will serve in a consultant capacity during the school year and continue on the university faculty as an associate professor of mathematics and graduate-program adviser in computer sciences. He has resigned his position with the University Computer Center.

C. G. YOUNG

DR. D. B. DEKKER

Richard G. Hamlet, chief systems programmer at the University Computer Center, and Monique R. Rona, chief scientific programmer at the center, have resigned their university positions to join the new firm.

A fifth incorporator is Richard L. Wilkinson, formerly Northwest sales manager of the Digital Equipment Corp.

TIME-SHARING of the capabilities of large, fast and complex central processors will be the principal mode of operation of the corporation, Young said.

The company plans to sell computer time via common-carrier lines from teletype machines or other electronic typewriter devices situated in customer offices.

The user will be able to communicate data directly to the computer and receive almost instantaneous reply in his own office.

The Computer Center Corp. plans to be in operation about November 1.

Westside S & L Leads July Gain

Westside Federal Savings & Loan Association in July led a local reversal of the usual July trend toward a decline in net savings.

Net savings rose only $200,000 last month in the 23 associations affiliated with the Seattle League of Insured Savings Associations. Westside, a member of the association, registered a gain of $433,000.

In 1966, when there was a tight money situation comparable to this year, league institutions suffered a July loss of $6.7 million.

Not clear if Carl G Young returns to U Washington after Computer Center Corp folds ...

2008 (October 3) - Carl Garland Young passes in Seattle

[HL005H][GDrive]

Carl Garland YOUNG, age 82, of Seattle, passed away on October 3, 2008. He was born in Portland, Oregon on March 26, 1926. Carl is survived by his wife, Verona, sons, Roger Young, Eric Young, daughter, Garland Young, granddaughter, Monika Young and brother, Gordon Young. Mr. Young is also survived by several nieces, nephews, relatives and a host of friends. At Carl's request, no services will be held. If desired, memorials may be made in Carl's memory to the donor's favorite charity. Arrangements by Evergreen-Washelli.

Biography

Jordis was born 27 July 1929 in New Rockford, North Dakota. She was the daughter of Alf Dahl and Nina Olson. She was baptized 30 October 1930 at the Kverness Lutheran Church in Brantford, North Dakota.[1]

She moved from North Dakota with her family and attended school in Seattle. Jordis traveled to Europe several times in the early 1950s, once on a trip to Norway and another trip to Paris.

Jordis married Carl Garland Young twice. They married for the first time on 13 December 1952 in Seattle.[2]They married for the second time 20 July 1956 in Seattle.[3] Jordis and Carl were the parents of three children. Jordis and Carl divorced.

Jordis worked as an administrator at the University of Washington for many years and also served as a thesis reviewer for graduate students.

Jordis was a loving mother and grandmother and also enjoyed traveling.

She died 13 December 2017 at a retirement home in Lake Stevens, Washington, at the age of 88.[4]

Born

December 18, 1948 (age 71)

Brooklyn, New York, U.S.

Alma mater

Columbia University

St Antony's College, Oxford

Occupation

Writer, businessman, and politician.

Dov S. Zakheim (born December 18, 1948) is an American businessman, writer, politician, and former official of the United States government. In the Reagan administration, he held various Department of Defense positions.

Early life[edit]

Dov S. Zakheim was born on December 18, 1948 in Brooklyn, New York. He earned his bachelor's degree in government from Columbia University in 1970, and his doctorate in economics and politics at St. Antony's College, Oxford University. He is Jewish.[1][2][3]

Career[edit]

Zakheim was an adjunct professor at the National War College, Yeshiva University, Columbia University and Trinity College, where he was presidential scholar.

Zakheim served in various Department of Defense posts during the Reagan administration, including Deputy Undersecretary of Defense for Planning and Resources from 1985 to 1987. There was some controversy in both the US and Israel over Zakheim's involvement in ending the Israeli fighter program, the IAI Lavi. He argued that Israeli and U.S. interests would be best served by having Israel purchase F-16 fighters, rather than investing in an entirely new aircraft.

Zakheim was signed a letter to Clinton about Iraq.[4][5][6] During the 2000 U.S. Presidential election campaign, Zakheim served as a foreign policy advisor to George W. Bush as part of a group led by Condoleezza Rice that called itself The Vulcans.

From 1987–2001, Zakheim was CEO of SPC International, a subsidiary of System Planning Corporation, a high-technology analytical firm. During that period he served as a consultant to the Office of the Secretary of Defense, and sat on a number of major DoD panels, including its Task Force on Defense Reform (1997) and the DoD's first Board of Visitors of Overseas Regional Centers (1998–2001). In September 2000 Zakheim is also a member of the Council on Foreign Relations, the International Institute for Strategic Studies, and the United States Naval Institute, and a member of the editorial board of the journal *The National Interest*. He is a three-time recipient of the Department of Defense's highest civilian award, the Distinguished Public Service Medal, as well as other awards for government and community service.

Zakheim was an Adjunct Scholar of the Heritage Foundation, a Senior Associate at the Center for Strategic and International Studies, and published over 200 articles and monographs on defense issues.

Zakheim was then appointed as Under Secretary of Defense (Comptroller) from 2001 in George W. Bush administration, and served in this capacity until April 2004. During his term as Comptroller, he was tasked to help track down the Pentagon's 2.3 trillion dollars' worth of unaccounted transactions. DoD financial experts, Zakheim said, are making good progress reconciling the department's "lost" expenditures, trimming them from a prior estimated total of $2.3 trillion to $700 billion.[7] In 2008, he was appointed by President Bush as a member of the Commission on Wartime Contracting in Iraq and Afghanistan.

Zakheim retired as a Senior Vice President of Booz Allen Hamilton in 2010. He currently is a Senior Fellow at the CNA Corporation, a senior advisor at the Center for Strategic and International Studies. He is also Co-Vice Chair of Global Panel America (Global Panel Foundation) with Sir Malcolm Rifkind, the former UK Foreign Secretary and Minister of Defense.

His most recent book, *A Vulcan's Tale: How the Bush Administration Mismanaged the Reconstruction of Afghanistan*, discusses the Bush administration's missed opportunities and struggles to manage two wars, particularly the seemingly endless conflict in Afghanistan.[8]

Zakheim also currently sits on the Atlantic Council's[9] Board of Directors.

Dov S. Zakheim is a former Pentagon official who worked in both the George W. Bush and Ronald Reagan administrations. His track record includes collaborating with a number of militarist advocacy groups—including the neoconservative Project for the New American Century and the Center for Security Policy—and working as an executive at a host of defense contractors such as Booz Allen Hamilton and Northrop Grumman. Zakheim has also been a fellow at CNA Corporation (home to the Center for Naval Analyses), an adviser to the Center for Strategic and International Studies, a member of the advisory council of the *National Interest*, and a lecturer at numerous universities, including the National War College, Yeshiva University, and Columbia.

In 2011, Republican presidential candidate Mitt Romneynamed Zakheim as a member of his advisory team on foreign and defense policy. Joining Zakheim was a host of other former Bush administration officials like Michael Chertoff and Eric Edelman, as well as several high-profile neoconservatives, including Robert Kagan, Paula Dobriansky, Eliot Cohen, and Dan Senor.[1]

In recent years, Zakheim has written about and participated in numerous public forums on U.S. foreign policy issues. In June 2012, he was a featured speaker at an event organized by the right-wing Heritage Foundation titled "The Liberation of the Falklands, Thirty Years After: Why the United States Must Back Britain Now."[2] Also in June 2012, Zakheim was a panelist at a conference organized by the liberal-hawk Center for a New American Security titled "Rethinking U.S. Security: Navigating a World in Transition."[3]

Zakheim is the author most recently of *A Vulcan's Tale: How the Bush Administration Mismanaged the Reconstruction of Afghanistan* (Brookings Institution Press 2011), which claims to provide an insider's view of the failures of the Bush administration in waging wars in Iraq and Afghanistan.[4]

Bush Administration

Zakheim was part of an informal team of foreign policy advisors assembled by candidate George W. Bush during the 2000 presidential campaign who were nicknamed the "Vulcans." Among the other Vulcans were Stephen Hadley, Dick Cheney, Donald Rumsfeld, Condoleezza Rice, and Paul Wolfowitz. "The Vulcans," wrote James Mann in his award-winning 2004 history of the Bush "war cabinet," "represented the generation that bridged what are commonly depicted as two separate and distinct periods of modern history: Cold War and post-Cold War. For the Vulcans, the disintegration of the Soviet Union represented only a middle chapter in the narrative, not the end or the beginning."[5]

After Bush's election, Rumsfeld tapped Zakheim to serve as his undersecretary for defense –comptroller, a post from which Zakheim oversaw Pentagon spending in the wake of the 9/11 terrorist attacks and the onset of the "war on terror." Zakheim remained as comptroller until 2004, overseeing three defense budgets, each totaling more than $300 billion, and implementing six wartime supplementary budget requests.[6]

Zakheim served as the Defense Department's chief financial officer during the 2003 efforts to streamline the department's spending procedures to reflect Defense Secretary Donald Rumsfeld's vision of a 21st-century military. Critics say some of the reforms removed congressional oversight and accountability from the defense budget. During Zakheim's tenure, the Defense Department's Inspector General found that the Pentagon could not properly account for more than $1 trillion of spent funds.[7]

As the Pentagon comptroller, Zakheim also served as coordinator of the Defense Department's civilian programs in Afghanistan and as an international fundraiser for Iraq reconstruction monies, organizing the October 2003 Madrid donors conference and the June 2003 UN potential donors conference.

In 2004 Zakheim stepped down from his post at the Pentagon with little explanation. However, his resignation followed a highly critical audit by the General Accountability Office.

Like other former Bush administration officials, Zakheim became heavily critical of the administration's track record after leaving office. In 2006, he coauthored a piece in the *National Interest* with Daniel Pipes, Tommy Franks, and four others, stating: "Iraq's seemingly never-ending violence, whether it is termed a civil war, or, more euphemistically, 'sectarian strife,' has created a sense of instability, insecurity, and raw fear, for all but those Kurds living in Kurdistan. Democracy in this environment is nothing more than a sorry catch-phrase."[8]

In January 2007, Zakheim argued in an op-ed for the *Financial Times* that Iraq had fallen into a civil war and advocated that the United States pull back to Iraq's borders. "No doubt some will see this as the United States giving up on democracy and being content to stand by as Iraqis kill each other. Yet clearly democracy in Iraq must await the end of the civil war. … The strategic shift would bring relief to our overstretched and over-deployed military. It would reduce combat losses. Above all, it would give the military a mission that they can achieve. This way we can finally bring to an end a bitter domestic debate over Iraq policy that has so undermined public faith in the judgment and wisdom of their leaders on both sides of the political aisle."[9]

Defense Industry and Advocacy

Shortly after leaving the Pentagon in 2004, Zakheim became a vice president at Booz Allen Hamilton, a defense contractor that has employed a number hawkish policy figures, including former CIA head James Woolsey and retired air force general Thomas Moorman. Among the group's more notorious activities were its efforts during the lead-up to the 2003 invasion of Iraq to assist corporations in securing contracts for work in that country.[10]

Zakheim's involvement with the defense industry began when he first joined the Pentagon in 1981, serving in various posts including special assistant to the assistant secretary for international security and assistant undersecretary for policy and resources, before moving up into the post of deputy undersecretary of defense for planning and resources, working in systems acquisition and strategic planning.

When Zakheim left the Defense Department in 1987, it was for an executive vice president post with the Virginia-based government contractor Systems Planning Corporation (SPC), which has supplied the Defense Department with military technology for several decades and has been a support contractor for

the Defense Advanced Research Projects Agency (DARPA). Zakheim also served as CEO at subsidiary SPC International and as a consultant for the defense contractors McDonnell Douglas (now a part of Boeing) and Northrop Grumman.[11]

At the same time as he was working in the private sector for companies that benefit from defense spending, Zakheim was busy advocating for policies that implied increased defense spending. While still at Systems Planning Corporation in April 1998, Zakheim participated in an SPC "roundtable" discussion for the Rumsfeld Missile Commission.[12] According to a 2002 *Washington Post* story, it was this interaction with Rumsfeld that solidified Zakheim's reputation as someone who shared the future defense secretary's vision of streamlining and modernizing the U.S. military.[13]

After Bush took office in 2001, Zakheim was tapped by Rumsfeld to serve as comptroller based on his experience with defense and budgeting. As Rumsfeld told the *Washington Post*in May 2001: "I put together a few small groups, to look at some things that I thought were priority issues. Some the president asked me to. And with the thought that we could get some bright people looking at them and then we'd plug them into the Quadrennial Defense Review which we're going to do, and that starts now. … Zakheim got on board Friday and he has taken the thought that came from the financial management business that Senator [Robert] Byrd raised with me, and has thoughts, and they will again be doing some internal changes and then making some proposals for legislation at some point."[14]

Zakheim was also involved with advocacy groups like the Committee for Peace and Security in the Gulf, a neoconservative-led initiative originally formed in 1990 to support the first Gulf War. In 1998, the group sent an open letter to President Bill Clinton calling for a "comprehensive political and military strategy for bringing down Saddam and his regime." Fellow signatories included Rumsfeld, Richard Perle, Wolfowitz, Douglas Feith, Elliott Abrams, Paula Dobriansky, Frank Gaffney, Bill Kristol, Michael Ledeen, Joshua Muravchik, Jeffrey Gedmin, Fred Ikle, Robert Kagan, David Wurmser, and Peter Rodman.[15]

Zakheim later joined several of these same people in supporting the Project for the New American Century (PNAC), a neoconservative organization that played an important role in driving public and official support for the invasion of Iraq before and after the 9/11 attacks. In 1998, Zakheim signed a PNAC open letter to Clinton about the crisis in Kosovo. The letter called for U.S. support for regime change in Belgrade. Two years later, Zakheim contributed to a PNAC paper titled, "Rebuilding America's Defenses." The paper claimed that "If the United States is to maintain its preeminence—and the military revolution now underway is already an American-led revolution—the Pentagon must begin in earnest to transform U.S. military forces."

The PNAC paper also opined that in the absence of some "catastrophic" event akin to Pearl Harbor, such reforms would happen at a glacial pace. A year later, 9/11 seemed to provide such a spark to the kind of rapid transformation envisioned. "The system is a slow system to react until something happens, and something has happened. And the system is reacting," the *Washington Post* quoted Zakheim as saying in 2002. "This is going to push our [agenda] ahead, obviously geared to the war effort, precisely because it was this kind of war that many of us feared and anticipated."[16]

In 2005, after leaving the Pentagon, Zakheim remained an advocate for funding and policy to promote the "military transformation" of U.S. armed services. In an opinion piece, Zakheim wrote that Rumsfeld spent billions on such transformation programs, and he cited the wars in Iraq and Afghanistan as examples of the need for a restructured military that is more responsive, flexible, and interconnected.[17]

An Equivocal Neocon?

Zakheim is often characterized as a neoconservative because of his frequent association with neocon groups and his support for some hawkish Middle East policy prescriptions. However, a close look at his track record reveals a more complicated picture.

In 1996, Zakheim published *Flight of the Lavi: Inside a U.S.-Israeli Crisis*, which detailed his role while in the Reagan Pentagon in ending the IAI Lavi program, an initiative in the 1980s in which Israel researched and developed its own fighter jets (called the IAI Lavi). Zakheim reinforced the U.S. position that Israel should not produce an aircraft that would compete with the U.S. F-16, arguing that it was more efficient for Israel to buy jets from the United States. An ordained rabbi and an orthodox Jew, Zakheim was publicly criticized and harassed for his role in opposing the system and purportedly going against the interests of Israel. Today the Israeli Air force has the largest fleet of F-16s outside of the United States.[18]

More recently, in February 2012, Zakheim produced a monograph for the CNA Corporation that called for the United States to dissuade Israel from unilaterally attacking Iran, a view that contrasts sharply with that of many neoconservatives. Titled “The United States Navy and Israeli Navy: Background, Current Issues, Scenarios, and Prospects,” the report highlighted Israel’s rapidly changing security environment and the potential implications for both Israeli and U.S. naval policies. “Israel’s increasing isolation in its region, its parting of the ways with Turkey, and the changes being brought about by the Arab Spring, are altering the Israeli government’s strategic calculus. The passage of Iranian warships through the Suez Canal, Egypt’s readiness to terminate its blockade of Gaza, and Turkey’s readiness to escort flotillas to Gaza all point to a much more challenging eastern Mediterranean environment for the IN [Israeli Navy]. In addition, Egypt’s change of policy indicates that the IN can no longer be certain of its freedom of movement into and out of the Red Sea.”[19]

In responding to this evolving situation, Zakheim urged restraint: “It is in the USN’s [U.S. Navy]—and America’s—interests that the IN not act independently against Iran, either by launching any attacks against Iran from the Arabian Sea or even by boarding Iranian origin ships on the high seas. … [T]he USN, to the extent that it has a voice in policymaking circles, should seek to encourage the IN to follow a path of caution and moderation, if only because so many of Israel’s regional neighbors see it as an extension of the United States. This is a tall order for the USN, and it cannot moderate Israel on its own—it is questionable whether anyone can—but it is critical that it at least attempt to do so, for the sake of both navies and the nations they defend.”[20]

Such views have led some observers to claim that at heart Zakheim is not a neoconservative, but a realist. As a writer for *The Jerusalem Report* wrote shortly after Zakheim stepped down from his Pentagon post in 2004, “Wolfowitz and Feith were among the chief proponents of war with Iraq, while Zakheim is more associated with the pragmatic faction of the Republican Party. He served in the Reagan administration as an undersecretary of defense from 1985 until 1987 and is generally considered responsible for killing the Lavi project, an initiative to build an Israeli fighter jet with American technology.”[21]

Similarly, in a *New York Times* article published just after the 2000 election, James Traub wrote: "Dov Zakheim, for example, has written that the scale of atrocities in places like the Balkans is often exaggerated, and that in any case violating another nation's sovereignty threatens 'to unravel the entire fabric of international relations.' Zakheim concludes that we should intervene 'only when our own interests are clearly at stake, or when genocide is so manifest that refusal to act would destroy our moral leadership of the free world.'"[22]

In contrast to the above, however, are the numerous affiliations with neoconservative groups Zakheim has maintained over the years—most notably with the Center for Security Policy and the Project for the New American Century—as well as his at times stark characterizations of Israeli and U.S. opponents. Following the January 2006 election of Hamas in an open contest in the Palestinian territories, for example, Zakheim repeated a number of misleading historical parallels often employed by neoconservatives like Richard Pipesand Norman Podhoretz, to argue: "We have a situation not unlike Germany in

1932 when we had an upstart [Nazi] party ruled by thugs that preached hatred and racism and also claimed they would clean up a corrupt Weimar Republic. The parallels are frightening."[23]

Source : [HL006U][GDrive]

Background

Mr. Zelikow was born on September 21, 1954 in New York, United States. He is a son of Nate and Lee (Landsman) Zelikow.

Education

Philip Zelikow attended the University of Houston between 1972 and 1975. He received his degree of Bachelor of Arts from the University of Redlands in 1977. In 1981 Mr. Zelikow obtained Juris Doctor degree from the University of Houston. He also completed his studies at Tufts University, earning Master of Arts in 1984. In 1995 he received Doctor of Philosophy from the same university.

Career

- In 1979 Mr. Zelikow held the post of a briefing attorney at Texas Court of Criminal Appeals, Austin. From 1980 to 1983 he acted as a trial attorney at David Berg and Associates (now Berg & Androphy), Houston, Texas. After practicing law in the early 1980s, Mr. Zelikow turned toward the field of national security. He was adjunct professor of national security affairs at the Naval Postgraduate School in Monterey, California in 1984-1985.
- During the period of 1985-1989 Philip D. Zelikow occupied several posrts at the U.S. Department of State, Washington, District of Columbia: political officer and political adviser in Vienna, Austria, watch officer at Operations Center, Washington, District of Columbia, and line officer for Secretariat Staff, Washington, District of Columbia. Between 1989 and 1991 he served as a director for European security affairs at National Security Council, Washington, District of Columbia.
- In 1991 Mr. Zelikow became an associate professor of public policy at Harvard University, Cambridge, Massachusetts, and later member of Center for Science and International Affairs and Standing Committee on European Studies.
- He has been a contributor to books, including Securing Peace in the New Era: Politics in the Former Soviet Union and the Challenge to American Security, Nuclear Weapons in a Transformed World and The CIA and Estimates of the Soviet Union, 1950-1985. Moreover, he is known to be a contributor to periodicals, including International Security, Foreign Affairs, Journal of Strategic Studies, World and I, Political Science Quarterly, and Survival.

Achievements

- Philip D. Zelikow is notable for his writings connected with the areas of history and public policy. Mr. Zelikow has also written about terrorism and national security, including a set of Harvard case studies on "Policing Northern Ireland." He also has co-written many books. He is a recipient of several grants from Municipality of Afulah (1992) and from Vatat.

Born

Philip David Zelikow

September 21, 1954 (age 66)

New York City, New York

Education

University of Redlands

University of Houston Law Center

The Fletcher School of Law and Diplomacy

Occupation

Academic

Philip David Zelikow (/ˈ zɛlɪkoʊ/; born September 21, 1954) is an American attorney, diplomat, academic and author. He has worked as the executive director of the 9/11 Commission, director of the Miller Center of Public Affairs at the University of Virginia, and Counselor of the United States Department of State. He is the White Burkett Miller Professor of History at the University of Virginia and was American Academy in Berlin Axel Springer Fellow, in the fall of 2009.

Education

Zelikow received a BA in history and political science from the University of Redlands, a J.D. from the University of Houston Law Center (where he was an editor of the law review), and a MALD and Ph.D. in international relations from The Fletcher School of Law and Diplomacy at Tufts University.

Career

Academic and federal government positions

After practicing law in the early 1980s, Zelikow turned toward the field of national security. He was adjunct professor of national security affairs at the Naval Postgraduate School in Monterey, California in 1984–1985.

He joined the United States Department of State through the standard examination process for the foreign service as a career civil servant. As a Foreign Service Officer, he served overseas at the U.S. Mission to the conventional arms control talks in Vienna, at the State Department's 24-hour crisis center, and on the secretariat staff for Secretary of State George P. Shultz, during the second Reagan administration (1985–1989).

In 1989, in the George H. W. Bush administration, Zelikow was detailed to join the National Security Council, where he was involved as a senior White House staffer in the diplomacy surrounding the German reunification and the diplomatic settlements accompanying the end of the Cold War in Europe. During the first Gulf War, he aided President Bush, National Security Advisor Brent Scowcroft, and Secretary of State James Baker in diplomatic affairs related to the coalition. He co-authored, with Condoleezza Rice, the book Germany Unified and Europe Transformed: A Study in Statecraft (1995), an academic study of the politics of reunification.[1][2]

In 1991, Zelikow left the NSC to go to Harvard University. From 1991 to 1998, he was Associate Professor of Public Policy and co-director of Harvard's Intelligence and Policy Program, at Harvard's Kennedy School of Government.

In 1998, Zelikow moved to the University of Virginia, where until February 2005 he directed the nation's largest center on the American presidency. He served as director of the Miller Center of Public Affairs and, as White Burkett Miller Professor of History, held an endowed chair. The Center launched a project to transcribe and annotate the previously secret tapes made during the Kennedy, Nixon and Johnson presidencies.[3] In a presidential oral history project headed by James Sterling Young, it systematically gathers additional information on the presidencies of Reagan, George H.W. Bush, and Clinton.

Following an appointment at the Department of State from 2005 to 2007 during the Bush administration, Zelikow returned to academics at the University of Virginia. In 2011, he was appointed Associate Dean of the Graduate School of Arts & Sciences. He has been instrumental in restructuring the College of Arts & Sciences. Also in 2011, Zelikow was appointed by President Barack Obama to the President's Intelligence Advisory Board.[4]

Commissions and committees

- **Bush transition team**
  - In late 2000 and early 2001, Zelikow served on President Bush's transition team. After George W. Bush took office, Zelikow was named to a position on the President's Foreign Intelligence Advisory Board [PFIAB], and worked on other task forces and commissions as well. He directed the bipartisan National Commission on Federal Election Reform, created after the 2000 election and chaired by former presidents Jimmy Carter and Gerald Ford, along with Lloyd Cutler and Bob Michel. This Commission's recommendations led directly to congressional consideration and enactment into law of the Help America Vote Act of 2002.[5]
- **Markle Task Force on Security**
  - In 2002, Phil Zelikow became the executive director of the Markle Task Force on National Security in the Information Age. The Task Force comprises a diverse and bipartisan group of experienced policymakers, senior executives from the information technology industry, public interest advocates, and experts in privacy, intelligence, and national security. The Markle Task Force seeks to inform the policy judgments and investments of the federal, state and local governments in the collection and use of information as it relates to national security. The Task Force's reports and recommendations have been codified through two laws (IRPTA 2004 and the Implementing 9/11 Commission Report Act 2007) and several presidential directives.[6]
- **Executive director of the 9/11 Commission**
  - Zelikow was appointed executive director of the 9/11 Commission (National Commission on Terrorist Attacks Upon the United States), whose work included examination of the conduct of presidents Clinton and George W. Bush and their administrations prior to and on September 11,

2001. Zelikow's prior involvement with the administration of George W. Bush led to opposition from the 9/11 Family Steering Committee, citing the obvious conflict of interest of having previously worked on the Bush transition team. The Commission's Republican chair and Democratic vice-chair strongly defended Zelikow, both at the time and later.[7] In response to the concerns, Zelikow had agreed to recuse himself from any investigation matters pertaining to the National Security Council's transition from the Clinton to Bush administrations, which Zelikow had helped manage.[8]

- After being informed of the Department of Defense's Able Danger project by U.S. Army Lieutenant Colonel Anthony Shaffer, he failed to have the 9/11 Commission investigate, despite the promise that the Commission would investigate all 9/11 related topics. Able Danger was not included in the Commission's final report. In 2005 and 2006 a member of the House Armed Services Committee, Rep. Curt Weldon, publicized Shaffer's allegations in public statements and hearings.[9] A September 2006 report of the Department of Defense Inspector General found that these allegations were baseless. A further report by the Senate Select Committee on Intelligence came to the same conclusion in December 2006.[10][11]
- Some staff members of the 9/11 Commission distrusted Zelikow, considering him to be a "White House mole" in view of his being a close confidant of National Security Adviser Condoleezza Rice and his having worked in several high level capacities in the George W. Bush administration.[12]

- **Rice national security strategy project**
  - In Rise of the Vulcans (2004), James Mann reports that when Richard Haass, a senior aide to Secretary of State Colin Powell and the director of policy planning at the State Department, drafted an overview of America's national security strategy following the September 11, 2001 attacks, Dr. Rice, the national security advisor, "ordered that the document be completely rewritten. She thought the Bush administration needed something bolder, something that would represent a more dramatic break with the ideas of the past. Rice turned the writing over to her old colleague, University of Virginia Professor Philip Zelikow." One criticism of this document, issued on September 17, 2002, is that it is supposed to have been a significant document in an alleged Bush administration doctrine of preemptive war.[13][14] However, in the drafting of this document Zelikow had opposed the proposed language using preemption in the context of how to deal with weapons of mass destruction.[15]
- **Rework America**
  - In 2014–15, while on leave from the University of Virginia and working for the Markle Foundation, Zelikow helped lead a Foundation-sponsored group of prominent Americans called "Rework America." The group developed arguments and ideas on how to use the digital revolution to enlarge economic opportunity for all Americans. The group published its ideas in "America's Moment: Creating Opportunity in the Connected Age."[16]

George W. Bush administration

Zelikow's role in the second Iraq war is discussed at some length in Bob Woodward's State of Denial, which presents him as an internal critic of the way the war was being conducted in 2005 and 2006, and as an originator of the alternative approach termed "clear, hold, and build." He is also named by sources such as Jack Goldsmith's The Terror Presidency as an internal critic of the treatment of terrorist captives, and there was wide attention given to an address he made on this subject after leaving office in April 2007.

Based on speeches and internal memos, some political analysts believe that Zelikow disagreed with aspects of the Bush administration's Middle Eastern policy.[17]

As Counselor to Secretary of State Rice, Zelikow opposed the Bush administration Torture Memos. In 2006, Zelikow wrote a memorandum warning that the abuse of prisoners through so-called "enhanced interrogation" could constitute war crimes.[18][19] Bush administration officials ignored his recommendations, and tried to collect all copies of the memo and destroy them.[20][21] Jane Mayer, author of the Dark Side,[22] quotes Zelikow as predicting that "America's descent into torture will in time be viewed like the Japanese internments," in that "(f)ear and anxiety were exploited by zealots and fools."[23]

Expertise

Zelikow's area of academic expertise is the history and practice of public policy. In addition to the work on German unification, he has been significantly involved in contemporary scholarship on the Cuban Missile Crisis, including the relation between this crisis and the East-West confrontation over Berlin.

While at Harvard, he worked with Ernest R. May and Richard Neustadt on the use, and misuse, of history in policymaking. They observed, as Zelikow noted in his own words, that "contemporary" history is "defined functionally by those critical people and events that go into forming the public's presumptions about its immediate past. The idea of 'public presumption'," he explained, "is akin to William McNeill's notion of 'public myth' but without the negative implication sometimes invoked by the word 'myth.' Such presumptions are beliefs (1) thought to be true (although not necessarily known to be true with certainty), and (2) shared in common within the relevant political community."[24] "

Zelikow and May also authored and sponsored scholarship on the relationship between intelligence analysis and policy decisions. Zelikow later helped found a research project to prepare and publish annotated transcripts of presidential recordings made secretly during the Kennedy, Johnson, and Nixon administrations (see WhiteHouseTapes.org) and another project to strengthen oral history work on more recent administrations, with both these projects based at the University of Virginia's Miller Center of Public Affairs.

In writing about the importance of beliefs about history, Zelikow has called attention to what he has called "'searing' or 'molding' events [that] take on 'transcendent' importance and, therefore, retain their power even as the experiencing generation passes from the scene. In the United States, beliefs about the formation of the nation and the Constitution remain powerful today, as do beliefs about slavery and the Civil War. World War II, Vietnam, and the civil rights struggle are more recent examples." He has noted that "a history's narrative power is typically linked to how readers relate to the actions of individuals in the history; if readers cannot make a connection to their own lives, then a history may fail to engage them at all."[24]

Terrorism

Zelikow has also written about terrorism and national security, including a set of Harvard case studies on "Policing Northern Ireland." In the November–December 1998 issue of Foreign Affairs, he co-authored an article Catastrophic Terrorism, with Ashton B. Carter, and John M. Deutch, in which they speculated that if the 1993 bombing of the World Trade Center had succeeded, "the resulting horror and chaos would have exceeded our ability to describe it. Such an act of catastrophic terrorism would be a watershed event in American history. It could involve loss of life and property unprecedented in peacetime and undermine America's fundamental sense of security, as did the Soviet atomic bomb test in 1949. Like Pearl Harbor, the event would divide our past and future into a before and after. The United States might respond with draconian measures scaling back civil liberties, allowing wider surveillance

of citizens, detention of suspects and use of deadly force. More violence could follow, either future terrorist attacks or U.S. counterattacks. Belatedly, Americans would judge their leaders negligent for not addressing terrorism more urgently." [25]

Works written or co-written

Zelikow has co-written many books. He wrote a book with Ernest May on The Kennedy Tapes, and another with Joseph Nye and David C. King on Why People Don't Trust Government. Others include:

- Philip D. Zelikow with Condoleezza Rice, To Build a Better World: Choices to End the Cold War and Create a Global Commonwealth" Twelve, 2019. 528 pages, ISBN 1-538-76468-7

2013 (Sep 26) - Passing of mother, "Lee Landsman Zelikow"

Published•Thu, Sep 26, 2013 : https://jhvonline.com/lee-landsman-zelikow-p15850-124.htm

Lee Landsman Zelikow peacefully passed away in Houston, on Friday, Sept. 20, 2013, at the age of 86. Lee grew up on Long Island, in New York, where she was a gifted student who then devoted herself to caring for her parents after her father was disabled by a serious illness. Hired as a civilian employee of the U.S. Army, even before she was of age, and given a high-level security clearance, she later deployed overseas to work for U.S. occupation forces in Japan and in Okinawa from 1947 to 1950. Her charms won her titles as a beauty queen and admiring depictions on more than one aircraft fuselage.

Returning to America, Lee began a new life in Houston as a wife, mother and homemaker. Raising three children, she resumed her education, including graduate and other college coursework at Rice and the University of Houston, and became a sought-after consultant on health and nutrition.

Throughout her life, Lee was a passionate lover of the arts, especially music, and of foreign travel. After the death of her husband, Nate Zelikow, Lee found new happiness in marriage for the last 15 years of her life with Ron Morris as well as constant enjoyment in the love of her growing family.

Lee is survived by her children: Philip (and wife, Paige) Zelikow of Charlottesville, Va.; Sabrina (and husband, Edward) Engel of Houston; and Robin (and husband, Brian) Fontana of Houston; and by her grandchildren: Alexander Zelikow, Carolyn Zelikow, Hilary Engel Kamin (and husband, Brent), Natalie Engel, Bucky Engel, Meredith Fontana and Alec Fontana; and by her husband, Ron. She also is remembered lovingly by her in-laws, stepchildren, step-grandchildren and many dear friends.

Funeral services were held at the Emanu El Memorial Park, 8341 Bissonnet St., Houston, at noon on Monday, Sept. 23, 2013.

Next TRUMP MONARCHY ANNOUNCES "MAD DOG" KNIGHT IN TORY NATION

Previous Reconsidering Our Past To Understand Our Present

LOWELL P. WIGGLESWORTH, RICE UNIVERSITY, CIVIL WAR MOTIVES AND THE ZELIKOW 911 COMMISSION REPORT

by Shirley Locke Holmes, CPW News Service

from Catastrophic Terrorism: Imagining

the Transformative Event, 1998 for the

Foreign Affair, the magazine of the

Council on Foreign Relations, Nov-Dec. 1998.

David Ray Griffin and Peter Dale Scott are not the only analyst of the American experience of 911 who have raised issue with the *Official 911 Commission Report*. Historian Lowell P. Wigglesworth believes that the contrived 911 attack on the World Trade Center and the American Civil War were as engineered as the Transcontinental Railroad.

"That right. You can't really understand how we created civil war in the Middle East without knowing how it was done in the U.S.A.. The *911 Truth Movement* which now include architects and engineers, metallurgists, pilots and an array of physical scientists, physicists and chemists, have pointed out that the Lee Hamilton/Thomas Kean Commission that investigated the 911 attack were being handled by Condelezza Rice's aide Philip Zelikow who was an expert on terrorism writing in November-December 1998 about 'catastrophic terrorism'. Why is this important? Without making the connections of Philip Zelikow through Houston where he attended law school at the University of Houston, to his Tufts University thesis on the role of history and myth and to Rice University another center of myth spinning you're quite handicapped. Benjamin Rhodes, another heavy-handed manager of the Hamilton/Kean Commission report with Zelikow, along with David Rhodes, now CBS Television President, went to school in the shadows of the James A. Baker Center for Public Policy, named for Sec. of State, James A. Baker of the Baker & Botts law firm of historic Union and Southern Pacific attorneys. Rice is the school that produced both Kenneth Pitzer and Frank Vandiver. Pitzer protected the oil cabal against the potential energy encroachment of nuclear power and Vandiver sat over the Jefferson Davis Project that held the letters of Jeff Davis that proved the close relationship between Davis and the New England China trading opium smuggling power elites that drooled over the South's flatland rail route to the Pacific, the central core of my work on the U.S. Civil War," said Wigglesworth.

Philip Zelikow's home in Houston, Texas' Meyerland development.

From Harris County Clerk's records.

CLICK HERE TO ENLARGE

Indeed, Philip Zelikow was in Houston, Texas, having lived with his family in the Meyerland area where the leading High School of Bellaire is often called "Hebrew High". Zelikow's mother was from Long Island, New York and had worked in Japan after WWII with a top security clearance from 1947-1950. His father, Nate Zelikow, is mentioned in the book, *Making Movies Black* in chapter 5, noting that Nate Zelikow owned Nate Zelikow Productions (p 333). Philip Zelikow's interest in history and myth was therefore fed and watered at his home not far from his mother's alma mater, Rice University. In 2005 Frank Vandiver, a former Rice Unversity President like Kenneth Pitzer, had moved on to head up the Mosher Institute of Defense Studies at Texas A&M University where he wrote the book *How America Goes To War.* Ed Mosher of Houston's Mosher Steel had provided 13,000 tons of steel for the critical first nine floors of the WTC back in 1972. "This is a key element in the potential plan to bring down the towers along with just who was in the upper floors where planes hit. The WTC was designed by Minoru Yamasaki who has also been the architect for the infamous Pruitt-Igoe building in St. Louis used as the site of an undisclosed nuclear radiation test on unwitting America citizens and the subject of Dr. Lisa Martino-Taylors lengthy PhD dissertation. Both of Yamasaki's buildings were demolished by Controlled Demolition Inc, or CDI. Puitt-Igoe was demolished using thermite in 1972 as were the remains of WTC shortly after 911 to the horror of victims' families, especially the NYFD firefighters' families," said Wigglesworth.

Philip Zelikow's mother's obituary from the *Houston Chronicle*.

Click HERE to enlarge.

"Where David Ray Griffin does not go deep enough, nor Peter Dale Scott for that matter, is with the connections of Zelikow to David and Benjamin Rhodes

and Rice University's place in the academic atmosphere of the world's oil monopoly. "Houston, Texas is by virtue of the high concentration of petro-chemical geologists and engineers, the capital of the world's oil producers. Griffin rightly points out that the supposed attack on the WTC would have been much more devastating if the planes had they hit nearby nuclear power plants, but they didn't. Likewise, Salem Bin Laden, Osama's oldest brother, owned the Houston Gulf Manor Airport near the CIA linked Ellington Field from which attackers, Osama's older brother a highly experienced attack jet and BAC-111 jet pilot, could have staged attacks on the Houston petrochemical corridor within minutes of Gulf Manor airport which was bought for Salem by James R. Bath, GWB's Texas Air National Guard roommate, and Khalid Bin Mahfouz, the Saudi royal family's chief banker," said Wigglesworth adding "Minoru Yamasaki was the Bin Laden's leading architect for Saudi royal projects making a nice, neat, clean connection between the Bin Laden's and their architect and taking eyes off of potential hometown, Reichstag-rerun, culprits."

Wigglesworth is also concerned that not enough has been made of the fact that David Ray Griffin sees George Herbert Walker Bush's failure to take out Saddam Hussein in the first Gulf War was somehow indicative of his non-participation in the 911 event that Griffin also admits required substantial prior planning. "Saddam was, after all, originally our boy in Iraq and recipient of April Glasby's invitation to invade Kuwait," said Wigglesworth. "With thermite having been invented in the 1890's and with Minoru Yamasaki's role in Pruitt-Igoe, the spectacle's plan could well have been much older than first thought by the leading 911 Truth Movement analysts."

Griffin will reiterate Gerald Posner's assertion in *Why America Slept,* that three members of the Saudi royal family had prior knowledge of the 911 attack and that they were killed after the CIA informed Saudi intelligence of their stories. What seems farcical is that the heavy handed Saudi intelligence would surely have known that 15 of the 19 Saudi hijackers were planning something for the WTC and that given their close relationship to the Bush family that Prince Bandar would have triggered an interception. According to Wigglesworth you cannot expect Senator Bob Graham's book on 911 to really expose the censored last 28 pages of the *Official 911 Commission Report*. That would have to include Bin Laden's connections to Houston. Instead those last 28 pages send readers on a wild goose chase for Saudi involvement in LA, fifteen hundred miles west of Houston. When Graham's concerns are aired on CBS's *60 Minutes*, sitting at the controls of CBS is David Rhodes, brother of Benjamin Rhodes, and co-spinners of the 911 myth with Zelikow and all having been wet-nursed on Houston's oil spigot. Both David and Benjamin Rhodes' father and Zelikow's mother were Rice University alumni," said Wigglesworth.

"*Sixty-Minutes* had also botched the 1972 GWB Texas Air National Guard story that Mary Mapes first heard in 1999, but which CBS failed to unpack before the 2000 Presidential election....supposedly because Mapes' mother had died that year. "The story wasn't important enough to chase down without Mapes?" asked Wigglesworth. GWB's Air Guard memo story needed to mention that James R. Bath was Bush's Air Guard roommate and later the businessman who not only bought for Salem Bin Laden the Gulf Manor Airport in Houston, but he controlled the fuel supplies for Ellington Field though his company Southwest Airport Services with his partner in that company, William E. King, working for the new Bracewell & Giuliani law firm that was created with Mayor Rudy Giuliani after 911 and based in Houston. Bath and Mahfouz were board members of BCCI the Bank of Commerce and Credit International which Georgia Senator Sam Nunn called the 'Bank of crooks and criminals'...the chief Iran-Contra money laundering bank. Salem Bin Laden had died in a mysterious ultra-light airplane crash in Cibolo, Texas in 1988, the same year that CIA agent Matthew Gannon died while returning to the USA to ask the top ranking CIA at Langley just why the rank and file CIA agents across the Middle East had nothing on Al Qaeda in their files. "Gannon died on Pan Am 103 over Lockerbie, Scotland. Salem Bin Laden's death was reported falsely by CBS's Lowell Bergman to have been in his BAC-111 jet and not an ultra-light that inexplicably flew like a drone into a high power line," said Wigglesworth.

"Al Qaeda was created by the CIA from within the Egyptian-based Muslim Brotherhood to fight alongside the Mujahedeen in Afghanistan in the 1980's. This was not widely known among CIA agents even in 1988 when Gannon and Salem died, but Salem had been widely reported to have been using his BAC-111 jet in the 1980 'October Surprise' eight years before his strange death, not unlike the strange deaths of the three members of the Saudi royal family that Gerald Posner said knew about the 911 attack before it happened.....a forty-one year old dying of a heart attack, the other in a single car crash on his way to the funeral of the first and the third, a twenty-one-year-old, of thirst from having wondered by himself into the desert. Directly next to Frank Vandiver's Jefferson Davis Project on the Rice University campus is the Robert Herring Building. Built by the founder of Houston Natural Gas, the forerunner of Enron, Herring's widow, Joanne King Herring, had joined with Texas Rep. Charlie Wilson to weaponize Al Qaeda for the fight in Afghanistan. Our wars in the Middle East's Golden Crescent, the poppy growing region of the Ottoman Empire, is now doubly enticing because of oil," said Wigglesworth noting that Mrs. Herring's sons had created *One America News* which Wigglesworth said "joins CBS and the other news channels in the propagandizing Joseph Goebbels-like myth-spinning."

FIELD CHAPEL SERVICE JOINS AREA COUPLE

Helena Maria Nelson and Aviation Cadet LeRoy William Marx passed through a saber arch formed by non-commissioned officers in the bridegroom's division as they left chapel No. 1, Maxwell Field, Ala., Saturday evening following their marriage by Chaplain Sack.

For the 7:30 ceremony the bride wore white embroidered organza with long train, her fingertip fush veil capped with a Juliet headdress of seed pearls and her white bible having a spray of gardenias.

Joyce Marx, bridesmaid, had pink rosebuds in bouquet and headdress to accent the light blue in her silk marquisette dress. Aviation Cadet Bernie Zettl was best man. A reception followed the ceremony.

Cadet and Mrs. Marx are to reside at 5 Southmont drive, Perry street extension, Montgomery, Ala. Parents of these two are Mr. and Mrs. Harold Nelson, 719 Vine street, and Mr. and Mrs. William Marx, Dresbach, Minn.

IMPORTANT COLONEL GROVES

Colonel Groves, who was in charge of atomic energy operations during its investigation, progress and development until the perfection of the A-bomb dropped on Japan, must be very smart and also scientific. He must have kept a personal diary, and doubtless did have a very meticulous official record, of operations and persons engaged in such work. He certainly has been called upon by courts, to testify in criminal cases of un-American subversive activity, and before congressional investigations into such matters. He seemed to have all detailed information for instant answers. The latest was the German-born person arrested in London, who had worked on atomic energy projects here and is charged with relaying atomic "secret" information to Moscow, and of spying for the Communists here and in Britain, is the latest suspect, as to whom Colonel Groves has been called on to testify. His testimony is buttressed by that of Chief FBI, Edgar Hoover, another astute, vigilant, able and efficient official, who "broke" the case to the London authorities.

These two fine, highly important, courageous and most capable American officers continue their useful service to this Government and its people and will (should) not be forgotten by them. The great debate and general discussion going on about the hydrogen bomb calls for their continued usefulness, which cannot be dispensed with. They will be heard of often, no doubt, before this cruel war is over and at least some kind of peace and international "living together" are restored—and nobody knows when that will be.

HE GAVE HIS BLOOD

There is no satisfactory substitute for human blood; the only source is people. The philosophy of the National Blood Program—of giving blood—combines idealism with humanitarianism—giving of ism in the hearts of those who gave for others.

Dedicated to saving lives and preventing human suffering, the National Blood Program of the American Red Cross offers an un-

Sie Simon Case Set For Feb. 15

The slot machine case against Sie Simon, operator of Sie's Place, was set for Feb. 15 by Judge J. D. Stennis in city court at Biloxi Monday night. Simon is charged on five counts involving slot machines.

In other action Monday night, Judge Stennis fined the following: John Engler, Clyde Junius Singletary, Herbert Lee Keyes, Johnny Moore, Carl Wooten Siegal, Clarence Edwards, drunk, $5; Frank Allison Richards, Preston Cooley, Howard Joseph Abshire, Robert Gilliland, Williams Thomas Oakley, Roy Livingston Gardner, George Steven Cragnate, Benjamin Jefferson Kliman, Sterling Oleo Allen, Boyd Rodney Stewart, George Washington Fluker, Harry Francis Olmsted, Mrs. Joseph Wilburn, John Francis Sterne, Manuel Velazquez, Clifford W. Messer, James Garland Hakkins, Philip Harold Hein, Raffaele Quattrocchi, William Patrick Ryan, Hector Benavides, Vaco W. Guillet, Mrs. John Smith, Robert Aaron Gable, Bernie Edward Zettl, Thomas William Cox, Edward Leroy Harrison, Margie Parker, Miss Catherine Joseph, Ingeboigt B. Death Claims Red McHale In California

Death claimed the life of a retired PSNS chief quarterman electrician and well-known former Bremerton resident, Charles T. (Red) McHale, yesterday in Pacific Grove, Calif. He was 62.

Mr. McHale was employed at PSNS from 1923 until his retirement in 1952. While living in Bremerton, he was a member of several civic organizations.

He was born in Chicago, Ill., on June 26, 1896. During World War I he served in the navy and began working at PSNS following his discharge.

Upon retiring from the naval shipyard, he and his wife, Olga, moved to Astoria, Ore., where he became electrical superintendent of Astoria Marine Construction Co. from April 1, 1952, until June 30, 1957. He and his family then moved to Pacific Grove.

Obituary

C. T. (RED) McHALE

JUL 8 1958

During his years in Bremerton, Mr. McHale was a member of the Knights of Columbus and served one term as grand knight. He was also a member of the 4th degree of the Knights of Columbus. He was affiliated with the local Electricians union and was a member of Bremerton Elks, American Legion, Bremerton city planning commission and the PSNS supervisors association. He was also a member of the navy reserve.

Surviving are his wife, Olga, and daughters, Toni and Mary, at the family home in Pacific Grove, Mrs. Jack Couse of Bremerton, Mrs. Bernie Zettl of Omaha, Neb., and Mrs. J. P. Lundemo, Oceanside, Calif.; a son, navy Lt. (jg) E. B. McHale; three brothers, John J. McHale of Oak Park, Ill.; Patrick F. McHale and Joseph H. McHale, Chicago; and two sisters, Miss Anna McHale, Chicago, and Mrs. Margaret Hyland, Evergreen Park, Ill. He also leaves seven grandchildren.

Funeral services are pending at Miller-Reynolds funeral home.

RETIREMENT CEREMONIES

Seven ASD Officers Honored for Service

Seven Aeronautical Systems division officers have received medals on their retirement from the Air Force.

Col. Charles G. Allen received an oak leaf cluster to the Legion of Merit for outstanding services as deputy director of the Skybolt program.

The Air Force Commendation medal went to six officers. Col. Barton S. Pulling received it for meritorious service as ASD's deputy commander for research and engineering.

LT. COL. Charles O. Fraser was honored for his work as supply staff officer.

Lt. Col. Elmer M. Morse received the award for his service as chief of the advanced fabrications techniques branch in the Materials laboratory.

The medal went to Lt. Col. Louis P. Stanfield for service in the F110 special project office.

LT. COL. Constantine Svimonoff was honored for his work in the Dyna-Soar system program office.

Maj. Bernie E. Zettl got a similar award for his service in the B52 project office.

Also retiring at ASD were Maj. Robert A. Helterbran and M/Sgt. William E. Johnson, both of whom worked in flight test.

Dynalectron Names Planning Director

The appointment of **Bernie E. Zettl** as director of program planning was announced recently by **Charles G. Gulledge**, president of Dynalectron Corporation.

Zettl, a veteran of 20 years with the Air Force and industry in weapon system management and systems research and development operations, will work closely with the aerospace operations division of Dynalectron, which opened headquarters July 1 at 6000 Camp Bowie.

Gulledge said Zettl will work with all Dynalectron divisions in establishing plans and programming for future activities.

Lenn Jones has been appointed industrial and public relations representative in North Texas for the Texas Manufacturers Association.

Jones will be available for consultation with TMA members on industrial relations problems and will be serving Fort Worth, Dallas and other North Texas cities.

For the last 12 years, he has been associated with Safeway Stores in management and labor relations positions. He lives in Dallas.

Fort Worth Firm Wins Coffee Supply Contract

Kimbell Coffee and Tea Corporation of Fort Worth has been awarded a $147,071 contract for roasted ground coffee by the New York regional headquarters of the Defense Subsistence Supply Center which buys food supplies for the armed services.

Twelve firms competed for the contract.

A 10-year award pin was presented to **DAN R. BANNISTER**, vice president and manager of Dynalectron Aerospace Operations Division here.

Bannister, 33, of 4100 Galt, is one of the youngest aviation executives in the nation. A gold pen and pencil set were given to Bannister by **BERNIE ZETTL**, director of program planning. Also participating in the ceremony were **JACK VESTAL**, operations manager, and **JACK MIKEL**, personnel manager.

An extensive microwave system following the course of the Nile River from Cairo to Aswan will be built by Collins Radio which has a division in Dallas.

The 500-mile communication link will make television available for the first time to most Egyptian people.

JOSEPH P. POWELL has been named Houston manager of Mars Instrument Company.

The appointment of **EDWARD L. SKINNER** as sales representative for Texas and Louisiana was announced by **GORDON L. BROTT**, manager of the Fort Smith, Ark., plant of Ohio Rubber Company.

Skinner, a Dallas resident, is the former president of Renniks Rubber Company in Fort Worth.

HAL CARPENTER of Dallas has been named to supervise North Texas sales of the first rolled carpet goods to be produced in the mid-continent area.

Sequoyah Mills announced that Carpenter will be territory manager for the Fort Worth-Dallas metropolitan area.

Clary Corporation Vice President **EDSON I. SMALL** has announced the formation of a new marketing position and a man to fill the spot.

WILLIAM F. DORITY will fill the position of field sales manager, with his headquarters in Montclair, N. J.

A registered secondary offering of 350,000 shares of the Mosler Safe Company common stock ($1 par value) has been announced by Blyth & Company, Inc. and associates.

MICKEY GOLDMAN | ROY TUGGLE | SAM REZINKOFF | JOHN L. HANIGAN

JOSEPH P. POWELL | EDWARD T. SKINNER | C. H. ANSEL | DAN BANNISTER

The shares are being sold for the account of three members of the Mosler family who will hold some 57 per cent of the common stock after the sale. None of the proceeds of the sale will accrue to the company. Subject to obtaining board distribution of its common stock to meet requirements of the New York Stock Exchange, the Mosler firm intends to apply for listing on the exchange.

SAM REZINKOFF of 5400 Odessa has been elected to the Agents Advisory Council for the Southwestern region of the New York Life Insurance Company.

A marketing, research and business planning specialist, **ROBERT W. CLARK**, of Fort Worth has been appointed assistant to the president of the Western Company.

Clark has been associated with GE since 1947 and is former manager of the aviation and defense systems for the firm's outdoor lighting department in Hendersonville, N. C.

A new addition to the staff of Superior accounting, Tax & Insurance Service at 2850-A W. Berry, is **ROY TUGGLE**.

MICKEY GOLDMAN, Fort Worth business man, was one of the principals at a state meeting for Calvert Distillers Company in Dallas recently when executives of the firm came to Texas to launch Calvert Extra.

The appointment of **GORDON H. FISHER** of Gainsville as assistant to the president was announced by **FRANK R. MILLIKEN**, president of Kennecotte Copper Corporation. Fisher was president of General Minerals in Houston before joining Kennecotte.

ELBERT J. HALING, assistant to the regional director of Public Housing Administration in Fort Worth discussed "Better Public Relations for Better City Government" at the Arkansas Municipal League Convention at Hot Springs Friday.

FLOYD E. BLOUNT, Socony Mobil Oil Company of Dallas, will address the North Texas (Fort Worth-Dallas) section of the National Association of Corrosion Engineers Monday at the Torch Restaurant in Dallas at 8:30 p. m.

Three University of Texas professors have collaborated on a Textbook, "Intermediate Accounting," a new publication. The authors are **DR. JOHN WHITE, DR. GLENN A. WALSH** and **DR. CHARLES T. ZLATKOVICH.**

Preparations are underway at Aluminum Company of America's Rockdale, Texas, plant to restart a 25,000-ton potline, thus boosting the smelter's production to 100 per cent capacity and its work force to more than 1,000 men.

JOHN L. HANIGAN has been named president of Brunswick Corporation.

He will assume his new duties as soon as he can be relieved of his old ones.

The appointment of **C. H. ANSEL JR.** as technical representative for Haveg Reinhold Inc., Santa Fe Spcings, Cal., has been announced.

TOM F. ANDERSON of Alcoa has been elected president of Texas Chemcial Council, an association of more than 50 chemical firms with operations in Texas.

Hayes Employment Service has announced the complete remodeling and expansion of their offices in the Continental Life Building.

Promotion of **B. B. McCULLOUGH** from agent to assistant manager of Fort Worth District No. 1 of the American National Insurance Company of Galveston has been announced by **W. W. CHERRY**, senior vice president and director of combination agencies.

Dayton Daily News (Dayton, Ohio) · 26 Sep 1967, Tue · Page 23

Old Crows Flying to Washington

More than half a dozen Old Crows are flying from Dayton to Washington, D.C., this week to join some 1,000 others at what they're calling the greatest gathering of Crows in history.

The occasion is the fourth annual banquet of the Association of Old Crows — a nationwide group of people involved in the black art of electronic warfare.

AMONG those attending from the Dayton area will be officers of Dayton's Kittyhawk Old Crow club, C. V. Hoey, H. C. Gemmill, G. L. Ashby and W. J. Portune, A. P. Vogel, midwestern regional vice president, and F. K. Rae, special assistant to the national Old Crow president, who is a former Daytonian, Bernie Zettl.

The organization takes its name from Raven, an English code word from electronic warfare during World War II.

1968 (March 29)

National Association President To Address Local Old Crows

Bernie Zettl, national president of the Association of Old Crows, is scheduled as the featured speaker at the Tuesday meeting of the Raven Cajun Chapter of the AOC.

The meeting, slated to be held in the Gold Room at the Officers' Open Mess, will begin with cocktails at 7 p.m. and followed by a buffet style dinner at 8.

The primary business of the meeting will be the installation of officers elected by the general membership at the February meeting.

Members are invited to bring their dates to the meeting. Reservations for the dinner should be confirmed with Don Ryan at extension 3439.

Friday, November 1, 1968 BARKSDALE OBSERVER

'Old Crows' Convene In San Antonio

HQ. SAC (SAC PS) — An estimated 1,000 "crows" will migrate to San Antonio, Tex., Nov. 14 for the fifth annual meeting of an organization which has the unusual purpose of promoting an interest in electronic warfare.

The "Crows" are very human members of the Association of Old Crows who have the common interest of advancing the art of detecting and countering an enemy's electronics systems with other electronic systems and devices.

The Association is gathering to swap ideas and information and to commemorate some of the contributions of its membership to electronic warfare technology, according to President Bernie E. Zettl.

The Headquarters Strategic Air Command Chapter, known as the SAC Roost, has more than 100 members. They will be represented at the convention by Chapter President Capt. Don Rich, SAC Operations/Plans and six other members.

Maj. Al Michaels, Hq. 2nd AF, and Maj. John McNutt, 1st CEG, are the two Barksdale personnel who will attend the annual meeting in San Antonio.

The annual meeting and banquet is scheduled concurrently with the Tenth Annual NORAD Electronics Warfare Conference, also in San Antonio on Nov. 13-15. The Old Crows business meeting is scheduled for Nov. 14 at the Brooks AFB theater.

Banquet speaker will be Senator Joseph Montoya (D) of New Mexico, a longtime champion of the employment of electronic countermeasures (ECM). Master of ceremonies will be Dan Graves, from Aeronautical Systems Division at Wright-Patterson AFB, Ohio.

First organized in 1964, the Association of Old Crows' membership includes ECM personnel from all branches of the service in addition to industry and academic representatives. Associate membership is available to citizens of Canada, Great Britain, France, Sweden and Australia.

The Old Crows name dates back to the days of World War II when British ECM personnel rode black night fighter aircraft, wearing black flight suits. Because of this and the wily talents required for the job, the project was named "Raven." When American counterparts arrived for duty, they also became Ravens. The Americans later adopted the name of Crow as the American version of the same bird.

Total membership in the Association is 5,000 in 40 local clubs throughout the United States and overseas. Membership is open to anyone who has an interest in ECM. Headquarters of the Association is in Washington, D. C., P. O. Box 19127.

Electronic Warfare Men Gather in S.A.

By JERRY LOCHBAUM

Communist forces in North Vietnam were using radar to direct fire of anti - aircraft guns and missiles against attacking American planes. That was electronic warfare. The experts call it EW.

Americans devised a new kind of equipment called RHW, for Radar Homing and Warning, and went out to locate and destroy enemy radar sites in an effort code - named Project Wild Weasel. That was a venture in electronic countermeasures (ECM).

The Communists had a reply, however. They turned off their radar, and disappeared. That came under the heading of electronic counter - countermeasures (ECCM).

U.S. experts in the tricky, sophisticated and still largely secret field of work with electronic warfare and its many variants gathered in San Antonio Wednesday for two meetings which will continue through Friday.

● One is the 10th annual North American Air Defense Command electronic warfare convention at the School of Aerospace Medicine, Brooks AFB. Needless to say, it is being conducted in secrecy.

● The other is the fifth annual convention of the Association of Old Crows, a group of military and industrial people with interests in the field, meeting at Hilton Palacio del Rio

ELECTRONIC WARFARE

Continued from Page 1-A

Hotel in conjunction with the NORAD conference.

Specific details of EW approaches are secret, but the general ideas — evolving mainly from World War II experience, but with some threads reaching all the way back to World War I — have recently started coming more into the open.

Success of EW in overcoming doubts of skeptics in Vietnam is one reason for this, and another is growing scope of EW activity, observed Bernie E. Zettl, Washington, president of the Old Crows for the last two years.

"Southeast Asia has proven that electronic warfare is effective," he said. "Big money is being spent on this sort of thing."

Zettl said he has heard estimates that from $2 to $3 billion of federal money is being spent annually on EW.

Hundreds at Work

Every major electronics firm in the country, and hundreds of minor ones, are working in the field, he said. Every U.S. military airplane and missile is designed with EW considerations in mind.

Most of the work involved cannot be discussed, he explained. Some can be mentioned, one example being use of electronic gear along with photographic equipment on high - flying U2 reconnaissance flights.

Another example which has come to public attention is the work of ships like the U.S. intelligence vessel Pueblo, seized by North Korea last Jan. 23. It was loaded with equipment for intercepting radar and other electronic signals.

"What it means is the way you fight a war is changing" Zettl commented. Advanced technology is coming ever more into play. But despite the sophistication, some EW can be simple, and deadly.

There have been authenticated cases of American planes bombing friendly instead of enemy targets in Vietnam because of false radio directions broadcast in perfect English, said Col. Louis W. Pflanz Jr.

He is chief of electronic warfare, intelligence material, air defense, meteorology commodity areas, in headquarters of U.S. Army Electronics Command, Fort Monmouth, N.J.

U.S. fighter pilots flying missions in Vietnam were at first reluctant to sacrifice any of their load - carrying capacity to EW equipment, said Zettl.

But they were persuaded to try out the work of the mysterious black boxes, and found the missiles they could not outspeed or outmaneuver started going awry, he continued.

What happened, Zettl explained, was that confusing signals sent out on frequencies used by Communist radar degraded its performance. Missile direction became ineffective.

Then came the sequence of events cited at the beginning, including development of the Radar Homing and Warning system, which Zettl said automatically comes on when radar signals touch an airplane to warn a pilot he is being watched, enables him to locate the probing station, and detects firing of a missile against him.

Much Listening

To counter an electronic warfare system, you must know its characteristics, he pointed out. So there is much listening and electronic surveillance around the world, to gain information needed to fit U.S. equipment for specific EW, ECM or ECCM tasks.

EW, Col. Pflanz noted, deals with more than radar, extending across the whole spectrum of electromagnetic radiation except for ordinary, incoherent visible light. It includes coherent light, the kind emitted by lasers, as well as radio, microwaves, infrared, ultraviolet.

And EW equipment is designed for flexibility, for changing of output to meet changing needs, Zettl said.

For all the seriousness of this kind of dark warfare, its practitioners have a tradition of getting a kick out of fooling an enemy, he commented, out of producing "organized confusion" in keeping with the motto: "They shall not see."

"It's a challenge," he said. "It's a contest of wits and skills. It's like a chess game. You make a move. Somebody else makes a move."

Argue Over Approach

EW men talk of ELINT (electronic intelligence) and COMSEC (communications security) and a valued thing called QRC, quick reaction time, the ability to build or adapt equipment quickly to meet a need revealed by SIGINT (signal intelligence, both communications and non - communications).

They argue, Zettl said, over whether the best ECM approach against enemy radar should be to jam it with "noise," which the Air Force likes, or to deceive it with false signals, which the Navy goes for.

Fighting men on the ground as well as in the air are interested in EW, Col. Pflanz pointed out, one point of special interest being the tracking of an artillery shell to pinpoint the gun which fired it.

"This is one of the things that will take time to develop," he said. If more than one shell is fired, he explained, the computer used in tracking attempts is confused.

"Computers are heavy in this business," Zettl observed, noting they are needed for such tasks as sorting a great flood of signals.

While much EW equipment is under wraps, one product of EW research is in wide use by a probably unsuspecting public. Wide - band, high - fidelity video recording equipment now commonly used in TV, especially in color work, originally was developed in support of an EW need for high quality recording of electronic intelligence signals, Eettl said.

EW, which had its roots in such ideas as the British fleet's use of radio location in the World War I Battle of Jutland, blossomed in World War II with such maneuvers as the familiar use of metal foil "window" to confuse radar, the British misleading of German bombers trying to use a radar direction system, and the German use of radar reflective material on rafts to blot out the dark radar images of lakes Allied fliers used in navigation.

The British, Zettl said, called EW work by the code name Raven, a bird noted for dark and devious activity. Because of the secrecy of their work, and lack of acceptance, EW practitioners in the postwar period grew clannish and made much of the raven symbol, which eventually became a crow.

In 1964, their informal bond of common interest was formalized with organizations of the Association of Old Crows, which Zettl said has some 5,000 members. About 800 were expected for San Antonio sessions.

A highlight of their meeting will be a banquet address Thursday night by Sen. Robert C. Byrd, D-W. Va. They also are to install a new president, William S. Crawford, a veteran of Air Force EW work who now is electronic warfare product manager of Ryan Aeronautical Co. in Washingt nn

Zettl, also a veteran of Air Force EW work, is product line manager for electronic warfare in Washington for TRW systems group of TRW, Inc.

Blakely Heads Association

Samuel B. Blakely has been elected president of the San Antonio Association for Children with Learning Disabilities.

Other officers are Mrs. R. W. Handley, Mrs. Walter G. Lehr and Mrs. E. Solomon, vice presidents; Mrs. Martha R. White, secretary; Mrs. W. F. Hennessy, treasurer; Mrs. Joan Martinez, historian, and Dr. Wallace Bloom, parliamentarian.

Zettl elected Old Crows prexy

1970-10-05-garland-daily-news-pg-9-clip-old-crows-zettl

DALLAS — A Resalab, Inc., corporate executive, Bernie E. Zettl, has been elected president of the Association of Old Crows.

Zettl, who offices in Washington, D. C., will be officially installed at the annual meeting on October 8 during the association's Seventh Annual Convention to be held in Anaheim, California. He will serve as president for one year.

A national organization, the Association of Old Crows is made up of scientific and professional personnel engaged in the field of electronic warfare. It has been in existence since 1964 and has more than 9,000 members.

Arms and Influence

Grand-Jury Probe Jars The Close-Knit World Of Electronic Warfare

Did a Top Consultant Flout Law on National Security By Giving Data to Firms?

Old Crows and New Weapons

By Andy Pasztor
Staff Reporter of The Wall Street Journal

The Old Crow didn't get old by being the fastest of the birds, or the strongest, or the bravest. He got old by being wily.
—The unofficial motto of the Association of Old Crows

WASHINGTON—In the shadowy, high-tech world of electronic warfare, Bernie Zettl has been a prominent player and purveyor of inside information since he retired as an Air Force major in the early 1960s.

The gregarious 62-year-old consultant with the ready smile seems to know just about every important military and corporate decision-maker in the $3 billion-a-year business. He helped create and then served as president of the 20,000-member Association of Old Crows, a little-known but influential fraternity of electronic-warfare experts, U.S. military officers and corporate executives scattered around the globe.

Devices and Techniques

With his quick wit and connections, Mr. Zettl became an essential link to help industry understand the Pentagon's latest thinking about everything from new radar-jamming devices and submarine-surveillance techniques to improved anti-detection missile systems. From his nondescript suburban Virginia office, Mr. Zettl has worked at one time or another as a consultant for nearly a dozen of the country's largest military contractors, including TRW Inc., GTE Corp., Northrop Corp. and Sanders Associates Inc.

But in the process, federal investigators contend, Mr. Zettl violated national-security laws and regulations by quietly supplying certain clients with a steady stream of classified budget and planning documents that the Pentagon didn't want released. A continuing two-year federal grand-jury investigation of Mr. Zettl's activities hasn't produced an indictment as yet, but it has ended his cozy arrangements and sent shock waves through the close-knit group of senior military officers and civilian weapons engineers who routinely dealt with him. It has also prompted doubts about military-procurement procedures.

Many of the allegedly leaked documents, according to current and former officials familiar with the investigation, were clearly stamped "secret" and included internal spending projections for a variety of future Air Force and Navy weapons and electronic intelligence-gathering systems.

Unfair Advantage?

Dissemination of the information didn't endanger U.S. security, these officials agree, because none of the documents fell into the hands of people without the necessary federal clearance to handle sensitive military data. But investigators from the Justice Department and the Defense Department's inspector general's office want to determine how the allegedly unauthorized release occurred.

They also are raising questions about the role of the Old Crows and examining whether any contractors gained an unfair competitive advantage by obtaining the classified material outside official channels.

Interviews with Mr. Zettl, a group of his friends and business associates and several industry executives interrogated by prosecutors reveal the extent of the unusual federal investigation. The interviews also provide a rare glimpse inside the Old Crows, an organization that Mr. Zettl and others helped turn into a powerhouse in the weapons industry. The Old Crows, for example, quietly advise military leaders on complex technical issues, while the Pentagon routinely sponsors and provides space for the group's annual convention and also approves the presentation of classified papers there.

Violations Denied

Mr. Zettl denies violating any laws and asserts that the kind of consulting work he performed was "something that was done by many other people" in the industry. "I wasn't the only person in the loop," he asserts. "The documents were readily available to any company that wanted to go to the trouble . . . and pick them up. They really didn't have any reason to zero in on me."

Gus Slayton, the executive director of the Old Crows, argues that sharing the information, in fact, may have benefited U.S. security. "Industry is trying to figure out what kind of weapons systems government wants" for the future, he maintains, and routine exchange of information is a central element of that effort.

The Justice Department confirms that Mr. Zettl is the target of an "ongoing criminal investigation," but it declines to provide details. Washington attorney Robert Klimek, a retired Air Force colonel who represents the Association of Old Crows and at least one military official interviewed by investigators, says he has been assured by prosecutors that the group itself isn't a target of the grand-jury investigation.

The Pentagon declines comment. But privately some military officials worry that details of the investigation could provide critics with fresh ammunition about loopholes in the Pentagon's procurement practices at a time when federal spending on electronic weaponry is booming.

Quite apart from any potential criminal violations, investigators have documented a widespread pattern of information-swapping among members of the Association of Old Crows and their friends in uniform. Critics contend that these practices may have discouraged aggressive price competition among major weapons contractors, squeezed many smaller companies out of the business and hurt taxpayers.

Northrop, TRW and Sanders Associates deny receiving any unauthorized documents or information from Mr. Zettl. A Northrop spokesman says Mr. Zettl still serves as a "technical consultant" to one of the company's units. GTE officials decline to comment on the matter.

The association was founded in 1964 by a small band of World War II intelligence and electronics officers eager to share some drinks and recount their days of battlefield glory. The name comes from the code word "Crow," which was used to identify Allied aircraft that jammed German radar signals during bombing raids.

Outsiders first considered the group nothing more than "a marching and chowder society," recalls Rear Adm. Albert Gallotta Jr., one of the Navy's top electronic-warfare experts and the vice president of the Old Crows. But after developing a more professional image, conducting regular electronic-warfare training lectures for the Pentagon and stepping up efforts to recruit more members, the organization grew rapidly in both size and importance.

Chapters Abroad

It now boasts a pair of retired major generals on its executive committee and board of directors, along with committed members in corporate board rooms across the country. There are 81 separate chapters, or "roosts," including groups in Australia, Japan, Taiwan and the Netherlands.

2.

"We don't try to impede or criticize the military," explains William S. Crawford, another association founder who now works as a consultant in the field. However, that didn't prevent Mr. Zettl, one of the most senior and respected Old Crows, from running into difficulty: Pentagon auditors turned up an unauthorized classified document during a routine audit of one of Mr. Zettl's client companies, and the auditors started asking questions about how it got into the files. The company initially balked at providing an explanation, so the Pentagon's inspector general began a full-scale investigation to track down the leak. Mr. Zettl and his supporters won't identify the company, and neither will the government.

The investigation comes at a time when the Pentagon is enforcing tough new security protections and when senior policy makers such as Defense Undersecretary Fred Ikle are railing against leaks of all kinds. The Zettl case also coincides with publicity about a separate Pentagon investigation of allegations that a Ford Motor Co. subsidiary and other companies working on the Army's controversial $4.5 billion Divad antiaircraft gun hired at least eight retired military officers who previously had important roles in the weapon's development.

Expenditure Analyses

Among the documents Mr. Zettl allegedly passed to industry officials were five-year and one-year intelligence-expenditure analyses for the Air Force and summaries of electronic-warfare budget priorities for the Navy. Mr. Zettl maintains that all of the material was legally available to any contractor who had the required security clearance and could demonstrate "a need to know" about such projections. The most he was guilty of, Mr. Zettl's supporters contend, was technical violations of security rules for failing to officially sign out and adequately safeguard the documents.

"There are all kinds of people out there, call them consultants if you will, who make a living trying to understand such documents" and then translate them for companies, says Mr. Klimek, the association's lawyer. Mr. Klimek adds that when he worked on electronic-warfare projects in the Pentagon, "Bernie Zettl used to come around and talk to me from time to time" without ever abusing his security clearance by requesting documents.

Recently, Mr. Klimek asserts, the government has "tried to intimidate and threaten" him and some active military personnel who knew Mr. Zettl by calling them to testify before a grand jury in Alexandria, Va., or requiring them to submit to long interviews with Pentagon criminal investigators.

It isn't clear how many documents are part of the investigation, although some Old Crows familiar with the details of the case suggest it could be as many as a dozen spread over a period of several years.

Mr. Zettl won't discuss details of the documents, except to say that they didn't include the most highly classified and valuable "project-specific" information. And despite the government scrutiny of leaks, he asserts, "it's still good business and visibility for companies" selling to the Pentagon to have their executives elected to run the Association of Old Crows.

The association's officials and military backers strongly defend the organization. George Nicholas, the Pentagon's assistant director of electronic combat, says he was "concerned" when he first learned about the investigation but is now satisfied that the group's current leadership wasn't involved in any questionable activities. "The Pentagon has always supported the Old Crows," he says, and relied on them to help solve the "tough political and technical problems" of electronic warfare.

Lynwood Cosby, former superintendent of tactical electronic-warfare weapons at the Naval Research Laboratory who now works for Teledyne Inc. and is a past president of the Old Crows, says a major goal of the association is to "create the environment where exchange of information between the military and contractors can flourish." National-security restrictions, Mr. Cosby argues, sometimes "create an unnecessary impediment to the information flow" and prevent contractors "from knowing how to invest" intelligently for the future. "I'm not sure he (Mr. Zettl) did anything wrong," Mr. Cosby says.

Prosecutors' View

Prosecutors, on the other hand, are known to believe that committing even technical violations of security rules, particularly among people accustomed to dealing with sensitive information, would show that Mr. Zettl and his associates recognized that the documents were obtained and circulated outside the law. "The government attorneys keep insisting that the documents were stolen or otherwise corruptly obtained," says one Old Crow recently interviewed by investigators.

Adm. Gallotta suggests that the investigation is focusing on "questions of favoritism" involving some of the companies that hired Mr. Zettl. Anton Brees, a Northrop Corp. executive and retired Air Force official on the association's board, says that some Pentagon officer probably gave the documents to Mr. Zettl as a sign of friendship and trust. If so, Mr. Brees adds, such a relatively minor mistake "surely doesn't wipe out 20 years of productive and patriotic work" by the Old Crows.

Mr. Slayton, the association's director, says Mr. Zettl remains a member of the Old Crows but hasn't been active in running the organization for several years. Investigators have asked the association for information about several current or former members who were friends or business associates of Mr. Zettl. But it isn't clear how many other individuals in the association or in the Pentagon also may be targets of the grand-jury proceedings.

Some members of the group associated with Mr. Zettl appear bitter about the unwanted attention. Retired Air Force Maj. Gen. Gerald Carey, for instance, who works as a researcher at Georgia Institute of Technology and also serves as a director of the Old Crows, praises the association for creating a "vehicle that allows government, industry and universities to share information" about the latest advances in electronic warfare.

Without such cooperation, Mr. Carey suggests, the U.S. may be unable to take full advantage of developments in laser technology, electronically controlled optical systems, and artificial intelligence to track enemy weapons and avoid detection of its own. "I don't think what he (Mr. Zettl) was doing had anything to do with the Old Crows" or its importance as an institution, Mr. Carey argues.

Old Crows President Doyle Larson, former commander of the Air Force's Electronic Security Command, insists that the association helps give industry "guidance and direction" that would be "impossible" for the Pentagon to provide by itself.

The government's scrutiny of Mr. Zettl's consulting work also has raised questions about some of his other activities. A federal indictment released in Cleveland last month doesn't name Mr. Zettl as a defendant but says that he played a key role in helping a friend and former National Aeronautics and Space Administration official submit more than $6,800 of false travel vouchers to the government. The indictment says that Mr. Zettl participated in the allegedly fraudulent scheme at the same time that a number of his clients, including TRW and Sanders Associates, were interested in obtaining federal contracts at a NASA facility run by the same official.

Meanwhile, friends worry that Mr. Zettl seems increasingly depressed as the current investigation drags on. He has lost nearly all his defense-contractor clients, and many of the companies voluntarily tightened internal procedures for obtaining and handling classified materials. "They're afraid to have somebody working for them who is under investigation," Mr. Zettl complains.

The only reason the government singled him out for prosecution, the consultant told a reporter over the phone recently, is because "I was a big name in the aerospace industry. I knew virtually everyone in the business." But Mr. Zettl contends, "I didn't do anything different or improper" compared with "other people in the field."

Jury Indicts GTE Trio In Defense Fraud Case

WASHINGTON (UPI) — A federal grand jury has indicted three GTE Corp. officials for conspiring to obtain and use secret Pentagon documents to get government contracts, the Justice Department announced.

Attorney General Edwin Meese said the Justice Department also charged the defense arm of the company, GTE Government Systems Corp., in a separate action with an additional count of conspiracy.

The Pentagon said Tuesday the Waltham, Mass., company, which manufactures electronic warfare equipment, will plead guilty to the charge that it used the classified internal documents "to defraud the United States."

The indictment, returned in U.S. District Court in Alexandria, Va., charged a consultant and two company officials with illegally obtaining sensitive Pentagon budget documents that "reflect the potential procurements of the department ... (and) contain proprietary and classified information."

Those officials used the inside information to help the company obtain government contracts, the indictment said.

The indictment also charged the three with unauthorized possession of a classified document, using a section of the law normally reserved for espionage cases.

The separate count of conspiracy charged against the company said GTE officials took extraordinary steps to conceal their activity, the Justice Department said.

Named as defendants in the five-count indictment were:

- Robert Carter, 55, of Mountain View, Calif., a former GTE employee who was marketing manager of the Electronic Warfare Organization of GTE's Western Division.
- Walter Edgington, 60, of Annandale, Va., a GTE vice president for marketing with offices in Rossyln, Va.
- Bernie Zettl, 62, of McLean, Va., a consultant doing business as Zettl Associates, with offices in Virginia.

If convicted, GTE Government Systems Corp. faces a maximum fine of $10,000. The individuals indicted face fines and sentences up to $30,000 and 25 years in prison.

Budget data flowed freely in GTE bidding

By Bruce Mohl
Globe Staff

ALEXANDRIA, Va. – With thinning white hair and sporting a dark green sweater beneath a sportcoat, 62-year-old Bernie E. Zettl looks more like your typical grandfather than a spy.

But the US Justice Department says Zettl was indeed a spy, an industrial spy who worked as a consultant for some of the nation's largest defense contractors. The Justice Department has accused Zettl of violating federal espionage statutes by acting as the middleman in a conspiracy to obtain classified Defense Department budget documents.

Government investigators say Zettl acquired the secret documents from a source in the Pentagon and passed them along to GTE Government Systems Corp. of Waltham, Mass., which was eager to use the information to get a leg up on its competitors in bidding on government contracts.

Zettl declined to comment yesterday as he was arraigned in US District Court here. He asked for a jury trial and the trial date was set for Nov. 13.

But the GTE case, which broke last week, is causing consterna-

'Zettl was getting documents . . . [congressmen] can't obtain.'

– US Sen. Charles Grassley

tion in defense contractor circles, where, some contractors say, use of such classified budget documents is common industry practice.

The government crackdown is also giving jitters to a number of companies that have dealt with Zettl. Sanders Associates of Nash-

Bernie Zettl: More like a grandfather than a spy.

ua, N.H., which acknowledges it employed Zettl for 10 years, has been under investigation by the Justice Department, according to the company. Several Sanders employees were interviewed by government investigators earlier this year, but no action has been taken.

What is startling about the case is the acknowledgment that classified budget information not available even to Congress flows freely between the Pentagon and its suppliers. A GTE spokesman, for example, said the use of classified budget documents by contractors is frequently practiced. In its guilty plea last week, the company even said it would occasionally tell Zettl which documents it wanted.

"Zettl was getting documents from the inside and selling them, documents that members of Congress can't obtain," said Sen. Charles Grassley (R-Iowa). "It's an example of the old buddy-buddy relationship that just builds up between defense contractors and the Defense Department."

But industry officials said the Pentagon was well aware of what was happening and supported it. "It was kind of an open secret,"

Continued from Page 43

one source said. "Everyone knew what was going on."

Art Stanziano, a consultant in the field of anti-submarine warfare, said the Pentagon regularly holds meetings with contractors at which it lays out its plans. Often classified budget information is provided, he said. "I hope [the GTE case] doesn't have a chilling effect on this normal process," he said. "There needs to be a free flow of information between the two parties."

There was apparently little difficulty in obtaining the documents. Zettl told the Wall Street Journal earlier this year that "the documents were readily available to any company that wanted to go to the trouble . . . to pick them up."

In pleading guilty to the accusation of hiring Zettl to obtain the documents, GTE Government Systems Corp. was assessed the maximum $10,000 fine, as well as $590,000 to cover the government's legal costs.

One executive and one former executive at GTE were also charged. They pleaded innocent yesterday and will be tried along with Zettl.

Source of leak sought

Asst. US Atty. David H. Hopkins said the Justice Department's investigation is continuing in an effort to find out the source of the leak at the Pentagon and any other companies that might have benefitted from the information. Zettl was a consultant to more than a dozen major defense contractors.

Jack Bowers, chairman of Sanders, New Hampshire's largest private employer, said Zettl worked for the company as a marketing consultant from 1972 to 1982. "Beyond that I don't think we should make any statement," Bowers said.

Zettl was linked to Sanders in another case in Cleveland earlier this year. John McCarthy Jr., the former director of the National Aeronautics and Space Administration's Lewis Research Center, was convicted in June of submitting false travel vouchers and failing to divulge income from Zettl.

Asst. US Atty. Dan Polster said McCarthy was found to have traveled to Washington on business and submitted travel vouchers as if he were staying at a hotel there, when actually he would stay at a condominium he owned. McCarthy also failed to disclose that Zettl was paying him $500 a month to use the condominium and paying his condominium fees and utilities.

At the time, Zettl represented six companies, including Sanders, that were either doing business with or attempting to do business with NASA's Lewis Research Center.

Foot-dragging charged

Grassley, a member of the Senate Judiciary Committee, says the Justice Department dragged its feet on the Zettl case because neither GTE nor the Defense Department wanted the investigation to jeopardize existing and future contracts. Grassley said the GTE indictment was supposed to be the first of several, but because of the long delay in prosecuting GTE, other cases may have been jeopardized.

Grassley said he expects to focus on the delay in prosecuting GTE at upcoming hearings of the Senate Judiciary Committee. The hearings were called to focus on the Justice Department's handling of prosecutions of large companies.

Zettl's consulting business specialized in the field of electronic warfare. A retired Air Force major, Zettl worked in the fledgling field during World War II. In 1966 he helped found an association for those interested in electronic warfare. It was called the Association of Old Crows.

The term Old Crow dates from World War II, when US bombers were first outfitted with radio and radar receivers and transmitters, code named Ravens. The equipment operators were known as Raven Operators and, as the years went by, as Old Crows.

Today there are more than 23,000 Old Crows in more than 40 countries. An association spokesman says about 60 percent of the members work in private industry, and the rest are government employees. The association provided a perfect base for Zettl to make contacts within the Pentagon and at companies in the electronic warfare field. His clients included Northrop Corp. in Los Angeles and TRW Inc. in Cleveland.

Zettl worked for GTE from 1978 through 1983, when a routine government audit uncovered classified documents in the hands of GTE.

The subsequent investigation revealed that GTE had obtained several Defense Department budget documents, including the Pentagon's Five-Year Defense Plan and other papers outlining military programs and their objectives.

The Justice Department's indictment said these documents were used by GTE in preparing for potential contracts and for preparing bids and proposals. GTE, according to the Justice Department indictment, paid Zettl on a monthly basis. His annual fees ranged between $18,000 and $25,000.

GTE also tried to keep quiet its access to the documents, using a Post Office box in California to receive the documents and avoiding any discussion of Zettl's activities in his employment contract. One company memorandum recovered by government investigators said, in part: "Also, we do not want to list on paper the work that he is doing."

John Ellement of States News Service also contributed to this report.

Relatives

Wife (1st) - Charleen Olga Zettl (passed Sep 19, 2019)

September 6, 1929 - September 19, 2019 / Source : [HL005U][GDrive]

Charleen McHale-Zettl passed on 19 Sep surrounded by her children. She lived 90 event filled years and is survived by her children Mary, RoseAnne and Gary, and 2 granddaughters. She was from a long time Bremerton family connected to the Navy Shipyard. **She attended Star of the Sea & Bremerton High class of '48. Her first real job took her to Boeing Seattle as an admin worker. There she met a dashing Air Force pilot, Bernie Zettl, who snuck her on to the prototype Boeing 707, wearing a parachute for her first ever airplane ride!** They married a year later, joining the military family, and making many life-long friends. Charleen continued federal civil service work. In Dayton she worked in the office that developed the F-111. 20 years later her son piloted F-111's into harms way. She returned to Bremerton in the 80s and worked for the Red Cross. After her retirement she was a volunteer for 25+ years at the Puget Sound Navy Museum running the gift shop. Charleen led a life of service before self, qualities she inherited from this fine city of artisans, shipwrights and servicemen. In memory of her, please consider supporting the Navy Museum via an Amazon “smiles" login where a small percentage of each purchase goes to the museum at no additional charge.

Sister-in-law Mary Catherine McHale (passing June 2019)

July 31, 1922 - June 19, 2019 / Source - [HL005V][GDrive]

Mary Catherine was born in Pocatello, Idaho, as the first child of Charles T. (Red) McHale and Olga Schmidt McHale. The family settled in Bremerton, where it grew to seven; Mary, Rose, Francis (Toni), Terry Couse (all deceased), Charleen Zettl, PJ Lund (Bremerton), and Edward (Camarillo, CA). An alumna of Star of the Sea elementary school and Bremerton high school (class of 1940), she headed to Chicago to attend Mundelein College, including study abroad in South Hampton, England. In 1943, Mary joined the U.S. Army out of Ft. Lewis, Washington. She supported the war effort until its end in 1945 and returned to college at Seattle University. In 1950, after a few years in the private sector, Mary returned to active duty with the Army and was stationed in Ft. Ord, California.

The Monterey Bay area became her life-long home and she made a 44-year long career out of administrative support for the Defense Language Institute at the Presidio there (this included a 10-year stint in Washington, D.C.). She was a life-long member of Altrusa International and the Catholic Daughters of the Americas. Her Catholic faith was unwavering and demonstrated by her excitement to bundle up in her winter-woolies and stand at 4:00 am, in the freezing winds of Laguna Seca to see and hear Pope John Paul II.

Travel was a passion for her. If a friend suggested a trip to Europe, South America, or the Vatican, she was packed and ready to go… always toting a 35mm camera and a bag full of film. She had friends and a large, extended family all over the United States and would visit them regularly. She was an oral historian and could give you details of your own hometown that even you didn't know. The constant adventurer, Mary would never take the same route home from anywhere. Between the St. Angela Merici parish and the family home in Pacific Grove, it could take hours, with a cruise along the bay, or 17-Mile Drive, through the Presidio, up and down Prescott Avenue, or even a stop at Dennis the Menace park. Her nieces and nephews were always entertained and scared to death by her lack of attention to the road.

Mary moved back to Bremerton in 2006 and spent the last four years at Later Years Adult Family Home. The owner, Tammy and staff took wonderful care of her and enjoyed her feisty nature. She was an independent person, doing as she pleased until the end. Her family would like to thank everyone for their compassion.

Besides her two sisters and brother, Mary (Auntie Cathie to many of us) is survived by twelve nieces and nephews and thirteen great nieces and nephews

Frances McHale - Passing 2006 (June 14, 2006)

Source : [HL005W][GDrive]

March 10, 1925 To June 10, 2006

Frances A. "Toni" McHale, 81, of Bremerton died Saturday. She was born in Seattle to Charles and Olga (Schmidt) McHale. She attended Bremerton High School, and worked as an accountant for KBRO. She also worked with the Naval Post Graduate School, Fleet Numerical Weather Facility in Monterrey, Calif., the U.S. State Department in Guatemala and Keyport Naval Torpedo Station. Ms. McHale was an accomplished seamstress and knitter. She was an active member of St. Angela's Catholic Church. She was preceded in death by her sisters, Anna Barry and Theresa Crouse. She is survived by her brother, Edward McHale; sisters, P.J. Lund (Ron), Charleen Zettl and Mary Catherine McHale; her cousin, Noray Larson; and lifelong friends, Frances and Walter McConnell, Jeannie Rowlett and Jo Lauth. Visitation: 10 a.m. to 11 a.m. Friday at Holy Trinity Catholic Church, with a service to follow.

2018 (Jan 5) - Passing of Brother Robert B Zimmermann :

https://www.findagrave.com/memorial/186570067/robert-b-zimmermann

Birth 27 Dec 1926

Death 5 Jan 2018 (aged 91)

Burial : Brig Gen Wm C Doyle Veterans Memorial Cemetery

Arneytown, Burlington County, New Jersey, USA

Plot O2 6709

On January 5, 2018 of Magnolia, NJ. Age 91 years.

Beloved husband of the late Mary A. (nee Atkins). Devoted father of Barbara M. Irving, Nancy J. Perozzi, James R. Zimmermann, Steven E. Zimmermann, Carol S. Boyd, Robert W. Zimmermann, and Marianne L. McNeill. Dear brother of Evelyn Melk, June Martin, John Zimmermann, and Florence Paulson. Special friend of Sandy Russell.

He was very proud of his many grandchildren and great grandchildren and great-great grandchild with more on the way.

A U.S. Navy WWII veteran, Mr. Zimmermann was an original member of the Solid Rock Baptist Church where he was very active in the congregation and Sunday School classes right up until his death.

Relatives and friends are invited to attend his viewing Monday evening 4:00-6:00PM January 15th at the SOLID ROCK BAPTIST CHURCH 420 S. WHITE HORSE PIKE BERLIN, NJ 08009. Funeral service 6:30PM. Private interment in Brig. Gen. Wm. C. Doyle Veterans Cemetery Arneytown, NJ. Please, no flowers.

Contributions to Vision Baptist College Fund 420 S. WHITE HORSE PIKE BERLIN, NJ 08009 are preferred by the family. Arrangements under the direction of the COSTANTINO FUNERAL HOME 231 W. WHITE HORSE PIKE BERLIN, NJ 08009. For additional information or to send condolences: Costantinofuneralhome.com

Philip Richard Zimmermann Jr (born 1954)

Wikipedia Phil Zimmermann

Born Feb 12 1954 (https://www.s9.com/Biography/zimmermann-philip/)

Father : **Philip Richard Zimmermann Sr** (born 1922)

Wikipedia (saved) - [HK000E][GDrive]

Philip R. "Phil" Zimmermann *(born 1954) is an American computer scientist and cryptographer. He is the creator of Pretty Good Privacy (PGP), the most widely used email encryption software in the world. He is also known for his work in VoIP encryption protocols, notably ZRTP and Zfone. Zimmermann is co-founder and Chief Scientist of the global encrypted communications firm Silent Circle.*

Background

He was born in Camden, New Jersey. Zimmermann received a B.S. degree in computer science from Florida Atlantic University in Boca Raton, Florida in 1978. In the 1980s, Zimmermann worked in Boulder, Colorado as a software engineer and was a part of the Nuclear Weapons Freeze Campaign as a military policy analyst.

PGP

In 1991, he wrote the popular Pretty Good Privacy (PGP) program, and made it available (together with its source code) through public FTP for download, the first widely available program implementing public-key cryptography. Shortly thereafter, it became available overseas via the Internet, though Zimmermann has said he had no part in its distribution outside the United States.

The very first version of PGP included an encryption algorithm, BassOmatic, developed by Zimmermann.

Arms Export Control Act investigation

After a report from RSA Security, who were in a licensing dispute with regard to the use of the RSA algorithm in PGP, the United States Customs Service started a criminal investigation of Zimmermann, for allegedly violating the Arms Export Control Act. The United States Government had long regarded cryptographic software as a munition, and thus subject to arms trafficking export controls. At that time, PGP was considered to be impermissible ("high-strength") for export from the United States. The maximum strength allowed for legal export has since been raised and now allows PGP to be exported. The investigation lasted three years, but was finally dropped without filing charges.

After the government dropped its case without indictment in early 1996, Zimmermann founded PGP Inc. and released an updated version of PGP and some additional related products. That company was acquired by Network Associates (NAI) in December 1997, and Zimmermann stayed on for three years as a Senior Fellow. NAI decided to drop the product line and in 2002, PGP was acquired from NAI by a new company called PGP Corporation. Zimmermann served as a special advisor and consultant to that firm until Symantec acquired PGP Corporation in 2010. Zimmermann is also a fellow at the Stanford Law School's Center for Internet and Society. He was a principal designer of the cryptographic key agreement protocol (the "association model") for the Wireless USB standard.

Silent Circle

Along with Mike Janke and Jon Callas, in 2012 he co-founded Silent Circle, a secure hardware and subscription based software security company.

Dark Mail Alliance

In October 2013, Zimmermann, along with other key employees from Silent Circle, teamed up with Lavabit founder Ladar Levison to create the Dark Mail Alliance. The goal of the organization is to work on a new protocol to replace PGP that will encrypt email metadata, among other things that PGP is not capable of.

Zimmermann's Law

In 2013, an article on Zimmermann's Law quoted Phil Zimmermann as saying The natural flow of technology tends to move in the direction of making surveillance easier, and the ability of computers to track us doubles every eighteen months, in reference to Moore's law.

Awards and other recognition

Zimmermann has received numerous technical and humanitarian awards for his pioneering work in cryptography:

- *In 2018, Zimmermann was inducted into Information Systems Security Association (ISSA) hall of fame by the ISSA International Organization on October 16, 2018.*
- *In 2012, Zimmermann was inducted into the Internet Hall of Fame by the Internet Society.*
- *In 2008, PC World named Zimmermann one of the "Top 50 Tech Visionaries" of the last 50 years.*
- *In 2006, **eWeek** ranked PGP 9th in the 25 Most Influential and Innovative Products introduced since the invention of the PC in 1981.*
- *In 2003, **Reason** named him a "Hero of Freedom"*
- *In 2001, Zimmermann was inducted into the CRN Industry Hall of Fame.*
- *In 2000, **InfoWorld** named him one of the "Top 10 Innovators in E-business".*
- *In 1999, he received the Louis Brandeis Award from Privacy International.*
- *In 1998, he received a Lifetime Achievement Award from Secure Computing Magazine.*
- *In 1996, he received the Norbert Wiener Award for Social and Professional Responsibility for promoting the responsible use of technology.*
- *In 1995, he received the Chrysler Design Award for Innovation, and the Pioneer Award from the Electronic Frontier Foundation.*
- *In 1995, **Newsweek** also named Zimmermann one of the "Net 50", the 50 most influential people on the Internet.*

Simon Singh's The Code Book devotes an entire chapter to Zimmermann and PGP.

PHILIP ZIMMERMAN, WOULD-BE ASTRONAUT IN SUIT
. . . Science Club president and dozen friends at Cape Kennedy

Northeast High Students

Watch Apollo 16 Lift Off

When Apollo 16 lifts off today, students in the Northeast High School Science Club will be at Cape Kennedy with the million or so other visitors to watch the history-making event.

The trip was organized by the club and about 12 members are there, enjoying reserved parking spaces about three miles from the launch pad.

As part of the club's backgrounding for the trip, they examined and climbed into a demonstration space suit, which was sent to them by Robert E. Wilson, space science education specialist at Cape Kennedy.

Philip Zimmermann, club president, was anxious to try on the suit, since his ambition is to be an astronaut. Zimmerman will attend Florida Atlantic University next year as a faculty scholar.

New fight against war toys doesn't lower sales figures

By Rebecca Cantwell
Scripps Howard News Service

BOULDER, Colo. — Activists waging a fight against "war toys" have succeeded in raising eyebrows, but not in lowering sales.

"I don't want children — especially my own son — to become desensitized to violence and see being a soldier as a positive role model," said Philip Zimmermann.

He and his son, Matthew, 7, are among a dozen people who have protested the sale of war toys outside four Boulder toy stores in the days before Christmas.

Their targets have included guns, toy tanks and sci-fi toys that they say glorify destruction. Protesters are asking customers to write letters to store managers urging them to discontinue sales of the toys.

Kacie Cavanaugh, Matthew's mother, said protesters are trying to raise parents' awareness.

The protest so far has not altered consumers' buying patterns, said managers of Target and K mart, two outlets that sell war toys.

"They're just as popular as they used to be," said Phyllis Berka, manager of Boulder's Target store. "I have not seen a wave of anti-war-toy buying."

K mart manager Peter Stenbakken said military-toy sales have not dropped because of the protest.

But several toy stores are capitalizing on parents who wish to avoid military toys.

"Our pitch is we are a nonviolent toy store," said Sue Lounsbury, owner of Play Fair. "We don't carry squirt guns, we carry squirt animals," she said.

(Rebecca Cantwell is a reporter for the Rocky Mountain News in Denver.)

Grand jury is investigating encryption software exports

ASSOCIATED PRESS

SAN JOSE — A federal grand jury is investigating exports of a controversial computer program in a case that could affect how software is distributed worldwide.

U.S. Customs officials asked for an investigation into ViaCrypt of Phoenix and Austin Code Works of Austin, Texas, and the companies' plans for foreign distribution of software, including PGP, a program that turns data into an indecipherable code using encryption technology.

William Keane, an assistant U.S. attorney, confirmed that an investigation is continuing, but declined to comment on the case.

The PGP program has been distributed worldwide over computer networks by some computer enthusiasts who oppose the U.S. government's trade regulations on encryption.

The National Security Agency, which monitors international communications, has supported strict encryption technology export regulations, arguing that it would be difficult to keep tabs on hostile governments and foreign terrorists.

But opponents say the restrictions hurt sales and violate the First Amendment that protects the right to publish information about encryption.

"I wrote PGP to make democracy healthier. I didn't do it to make money," said Philip Zimmermann, a computer consultant who developed PGP.

"We believe everything we are doing is above board and well within the law," said ViaCrypt President Leonard Mikus. He said the company had no intentions of violating export regulations.

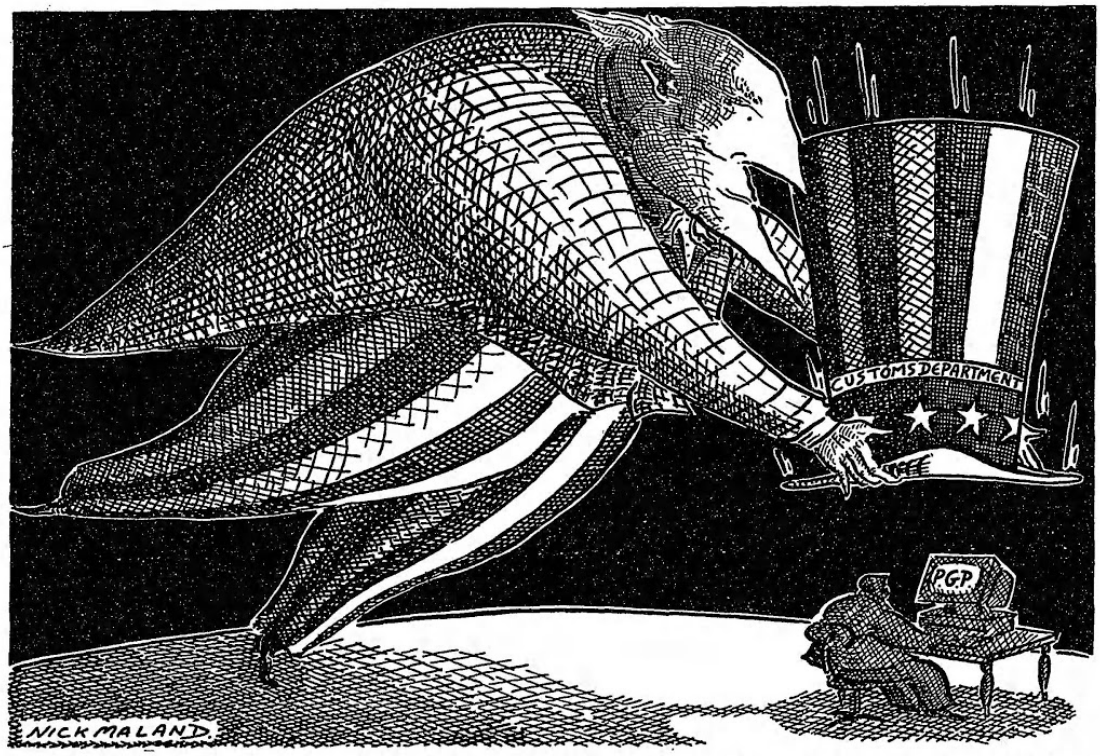
How computers could give us back the privacy that computerisation has taken away

Enter the crypto factor



Wendy Grossman

THE NEWS came, appropriately enough, over the electronic networks: Phil Zimmermann needs help. The details followed: the US Customs Department is investigating him to determine whether he was responsible for exporting full-strength encryption from the US. Under US law, strong encryption is classified as a munitions.

Zimmermann is the author of the first version of PGP, which stands for "Pretty Good Privacy". The program runs on a variety of microcomputers and is widely available as freeware on online services all over the world, including Cix and CompuServe. In fact, the program is probably "exported" many times every day. Anyone can use it to make sure that their electronic communications are secure.

Zimmermann seems to have become interested in cryptography as early as junior school. Computers came into it later: after taking a computer science degree in Florida he became a computer consultant specialising in cryptography. It wasn't until 1991 that PGP 1.0, a DOS program, was released: one of the technical difficulties was learning how to get computers to do calculations involving 300-digit numbers. Since then others have built on Zimmermann's work; there are versions of the program for DEC VAX VMS, Unix and even Microsoft Windows. There have also been improved DOS versions: we are now up to 2.3.

PGP is based on the RSA encryption algorithm, named for its developers, Rivest, Shamir and Adelman. RSA relies on a system called public-key cryptography. The program starts by generating two keys, a public and a private one. Your private key is just that: private. You keep it safe and share it with no one. Your public key, however, you get digitally signed by people who know you and can attest that it's yours. After that you can distribute it as widely as you like by any method you like. There are already "key servers" — one of them at Demon Internet Limited in London — where public keys are available for downloading by anyone who wants them. But you will, of course, keep a "key ring" of your correspondents' public keys, which you will use to decrypt their messages.

Public-key cryptography has several elegant features. First, the encryption really is "industrial strength". Second, the keys authenticate messages as well as protect them from prying eyes: if a message can be decrypted using your public key, that's a guarantee that the message came from you — and you can't later disavow it.

Enter the cypherpunks, to whom Zimmermann is a hero. Instead of relying on data protection legislation and the goodwill of systems administrators, they argue, use the computer to give us back the privacy that computerised systems have taken away. Think of encryption as an envelope: you wouldn't want to send all your private mail on postcards, would you? The private nature of the act of writing electronic mail and messages makes it easy to forget how public they really are.

Protecting the privacy of correspondence is only the beginning. Other proposed uses for encryption include digital cash, which would allow you to pay for goods and services electronically and anonymously, and selective smart cards, which would only tell authorities the information they need and no more. For example, you could have a card that told the DSS you were entitled to benefit, but gave staff none of your personal details.

The fact that it's illegal to export strong encryption from the US does not make it illegal to use PGP in the UK. However, it has been technically illegal to use PGP inside the US, because the RSA algorithm is patented by RSA Data Security, a company set up to exploit RSA, which was developed at MIT with public funding.

Ironically this patent is not valid in the UK and other countries, because of prior publication in Scientific American. This situation may be changing: a commercial version of PGP is being released in the US, and the GATT talks may uphold such US patents. (Of course many cypherpunks argue that it should not be possible to patent an algorithm, any more than you should be allowed to patent the human genome or a compound's molecular structure.)

The present US Customs investigation doesn't deal with the patent issues, only the export question. But it's come at the same time as Clinton's Clipper Chip proposals and the Digital Telephony bill, both of which seek to limit the strength of encryption available within the US. This has a certain irony: encryption is too dangerous to be given to the American public, but anyone can have a gun.

The result has been to give Zimmermann some of the gloss of a folk hero: he is regarded as being the man who gave strong encryption to the masses.

Zimmermann contends that he did not export PGP. But win or lose, he will face the usual astronomical American legal bills, so a defense fund has been set up by his attorney (email: dubois@csn.org). And win or lose, the technology is out there now. No amount of scouring of the world's hard discs will ever bring it back under control.

Encryption wizard rides out PGP trouble

Scripps Howard News Service

BOULDER, Colo. — Phil Zimmermann is enjoying a brief reprieve from his role as sentry on the electronic frontier.

As point man for privacy, he's been up in the watchtower for a long stretch. So it feels good to put his feet up in the booth at a natural-foods restaurant.

For the moment, there are no phone calls, no electronic mail, no deadlines. It's transitory, but it helps.

Because sometimes it's tough living with the irony.

"As a privacy activist, I value my own privacy and yet I've had to give up a lot of that privacy to be in the role I am now," he says.

Zimmermann is a 40-year-old software encryption wizard. He wrote a state-of-the-art program called PGP — Pretty Good Privacy — that has earned him admiration and excoriation.

Admiration because personal privacy is a notion near and dear to democracy. Excoriation because he outmaneuvered the U.S. government and intelligence agencies pushing their own competing encryption standard, the Clipper chip.

Despite all the attention, Zimmermann maintains he's not the best U.S. cryptographer "by far," though he acknowledges he may be the best-known.

He also acknowledges, with a laugh, that his 15 minutes of fame have been good for his consulting business. But he recognizes there are larger forces at work.

"I like being a political activist," he says. "But it's also hard. There are a lot of obstacles to getting this technology out. I have to do it in a way that doesn't break any laws. I think I have done it in a way that doesn't break any laws. It doesn't look to me like it breaks any laws. But the government feels differently and we'll have to see how that develops."

The legal situation is still fluid. Zimmermann is feeling a lot of heat right now from federal officials and from a San Diego grand jury. The reason is PGP.

Cryptography software is an electronic version of the cipher puzzles many newspapers carry. Those puzzles typically involve substituting one letter for another — T for E, for instance — to spell a word or phrase. The trick is to figure out the substitutions and solve the puzzle.

With conventional cryptography, the sender encodes a message using a key.

The person receiving the message must have the same key to decode it.

PGP employs something called public key cryptography, a method invented by mathematicians from the Massachusetts Institute of Technology in the late 1970s. It incorporates two mathematically related, but different, keys. Either key can be used to encode the electronic communication, but only the complementary key can be used to decode it.

The beauty is that you can tell everyone your public key, allowing them to send you private messages. After all, you're the only one who has the decoding key. Even the person who sends you the electronic message can't decode it.

"It's like those safes at 7-Eleven where they put the money in the drop box," says Zimmermann. "They can put it in but they can't get it out. You have to know the combination."

Although there are many versions of public key cryptography programs, PGP is considered the most powerful. It employs several complicated algorithms — mathematical formulas — and a 307-digit key. Cryptographers will tell you any cipher is breakable, given enough time. With PGP, you better have a few quadrillion years to spare or access to a bunch of supercomputers.

Zimmermann designed the original PGP in response to a bill in the U.S. Senate that would have required communications providers to build in a "back door" for plain text traffic. That back door would have official agencies armed with court orders to monitor illegal or potentially subversive communications.

Not long after he finished designing the first version of PGP in June 1991, Zimmermann gave it to a friend whom he won't name. The friend promptly published it on the Internet, the vast weblike network that links computers around the world.

"I didn't know much about the Internet," recalls Zimmermann. "I said, 'OK, just make sure not to export it.' After thousands and thousands of Americans got their hands on it, it spread to Europe."

That's when the trouble started. Because the Internet has connections in nearly every country in the world, putting information on it is the equivalent of handing out a global flier. But under State Department export regulations, encryption software fits in the same category as munitions. From the government's perspective, putting PGP on the Internet was akin to giving away state secrets.

Suddenly, with PGP's distribution over the Internet, anybody with a computer and modest technical know-how could code a message even the most powerful supercomputers — the kind governments typically have — would take decades, if not centuries, to break.

"This means that now, for the first time, it's possible to communicate securely with people you've never met without the prior exchange of keys over secure channels," says Zimmermann.

What public key cryptography, and PGP specifically, have done is make electronic privacy egalitarian, taking it from the realm of governments and the wealthy to the masses.

That may sound like the democratic ideal in action. But there's a big problem from the government's point of view. Criminals use computers, too, and if they can blanket their activities from the prying eyes of law enforcement or intelligence agencies, that makes it tough to protect the rest of us.

Zimmermann doesn't argue that point.

"People have asked me how I feel about criminals using this. My feeling is that criminals use cellular telephones and pocket pagers. In fact, those technologies in particular ... are notorious for use by drug dealers. ... But nobody seriously suggests we get rid of cellular phones and pocket pagers just because drug dealers use them. ... This is the same thing."

Government ire at Zimmermann goes deeper than criminals using PGP. The National Security Agency has developed its own encryption device, the Clipper chip. In pushing Clipper as the standard, the government proposes that anyone doing business with the federal system incorporate the chip in electronic communications devices, from computers to phones.

Part of the idea is to keep those communications secure. But another part of it is to allow government, law enforcement or intelligence agencies armed with the requisite court order to listen in.

Unlike PGP, the Clipper chip incorporates a back door, an entry for eavesdropping. When each Clipper chip is manufactured, the government gets a copy of the chip serial number and the associated master key. That information is escrowed at the U.S. Treasury Department and the National Institute of Standards and Technology. When an authorized agency wants to listen in, it obtains the master key from escrow and suddenly the private communication isn't so private anymore.

PGP changed the equation. Not only is it probably more powerful than Clipper — no one knows because the Skipjack algorithm behind Clipper is secret — but it also can be used on top of Clipper.

"The government is trying to intercede here with the Clipper chip and make illegal other kinds of encryption like PGP," contends Zimmermann. "It's sort of like the government saying I can't whisper something in your ear without them tapping into it. I ought to be able to whisper something in your ear, even if your ear is 1,000 miles away."

Zimmermann and cryptography go back 30 years. He recalls reading a children's book on secret writing when he was in the fourth grade. That was enough to hook him.

"I thought it was really cool," he remembers. "What kid wouldn't, right?"

His computer expertise is more recent. Born in New Jersey but raised in South Florida, he attended Florida Atlantic University in Boca Raton, where he planned to major in physics. But the computer scene was too hot to ignore.

"I took a couple of computer science courses in physics. I discovered I was spending so much time playing with computers, I decided I ought to get academic credits. I just thought they were cool and fun to play with, so I kept doing it."

In 1978, armed with a computer science degree from FAU, he headed for Colorado, where the Front Range already was a hotbed of high-tech hardware and software development. He translated his software expertise into a job at NBI, the Boulder-based maker of word-processing computers and programs. That lasted just long enough for him to decide to strike out on his on. Metamorphic Systems, a maker of the main circuit boards for Apple computers, was the result.

Like countless other entrepreneurial ventures, the firm foundered. Zimmermann found work quickly, this time with Storage Technology Corp. There, he was able to pursue his interest in cryptography and he began work on a research paper that introduced him to key players in the academic world.

About this time Zimmermann the political activist emerged. The nuclear freeze movement was at its height and Zimmermann put himself on the front lines. That led to a couple of protest-related arrests, his first real confrontation with law-and-order forces. Meanwhile, he was working behind the scenes as well.

"I saw cryptography as something important for political movements like the nuclear freeze to serve communications security needs," he recalls.

In 1985, Storage Technology Corp. slid into bankruptcy. Zimmermann was one of 3,000 people laid off in a single day as the company sought to cut costs and survive.

But if the layoff signaled the end of his career at Storage Technology, it also marked the beginning of a deeper involvement in cryptography — a pursuit that would lead to PGP.

Zimmermann's stand with PGP has earned him his share of enemies. Clipper chip proponents, who seem to be few and far between, aren't the only ones.

James Bidzos, head of RSA Data Security Inc. in California, is one. RSA Data makes its own encryption software, including MailSafe, which protects e-mail communications.

Though Bidzos is an outspoken critic of Clipper, he contends that popular perception of Zimmermann as some kind of high-tech Patrick Henry is hype.

"One guy said Zimmermann is trying to save the world from evil government," Bidzos says. "He did this to make money. ... He did two things others were not willing to do: He gave away the intellectual property of another party, and he turned a blind eye to (PGP's) illegal export."

Bidzos' anger stems from PGP's incorporation of certain RSA Data technology. There is considerable dispute about whether Zimmermann obtained that technology properly.

MIT recently took action that may produce a temporary truce. It issued the newest version of Zimmermann's program, PGP 2.5, over the Internet after obtaining a license from RSA Data to include its technology in the software.

Bidzos hasn't sued Zimmermann — yet. It may be that he figures it's a no-win situation. Even if he sues and wins, he's made a martyr out of someone who's widely perceived as an electronic patriot.

The PGP and Clipper chip debate has produced one of the strangest collections of bedfellows in recent memory. Big business and leftists, cyberpunks and corporate suits all are preaching from the same pulpit.

The pro-Clipper contingent, small as it is, holds an important hole card: Nowhere in the Constitution is protection of personal privacy spelled out. It may be implied, but it's not defined.

Indeed, U.S. legal code permits officially sanctioned invasion of our privacy if there's a compelling reason and the invaders follow legal form.

[...] PGP arouses passions like few other pieces of software. That's because PGP hits two raw nerves in the computer industry: the fight over encryption and privacy and the fight over software patents. And both of those fights are neatly encapsulated in the person of one computer scientist, turned peace activist turned cryptography outlaw, turned Cypherpunk spokesman: Phil Zimmermann.

Phil Zimmermann: On the Road to PGP

Phil Zimmermann doesn't fit the mold of the typical Cypherpunk. Married with two kids, Zimmermann lives in a small house in Boulder, Colorado, where he tries as best as he can to make a living as a full-time cryptography consultant. He feels more comfortable in a suit and tie than in a T-shirt and jeans. Zimmermann doesn't lead a glamorous, flamboyant life, but then cryptography isn't high-stakes poker. At least, it didn't used to be.

Zimmermann was born in Camden, New Jersey, in 1954, but his parents soon moved to southern Florida. He spent most of his formative years in Miami and Fort Lauderdale. When it was time for college, he picked Florida Atlantic University in nearby Boca Raton.

In college Zimmermann first studied physics, but soon he was bitten by the bug and switched his major to computer science. He met one of the school's switchboard operators, fell in love, and got married on the spring equinox in 1977. He took a year off from school to get some real-world experience working at Harris Computer Systems Division in Fort Lauderdale, where he worked on a Fortran compiler, an interval arithmetic package, and some other compiler tools. When he graduated from college in late 1978, Phil and his wife packed up everything they owned and moved to Boulder, Colorado.

Phil didn't have a job waiting for him in the Rockies, but Boulder sounded like an interesting place to live. The mountains represented a big change from the life that the couple had known on the Florida coast. And Zimmermann's degree in computer science, combined with his year of work experience, meant that he didn't have to look long for work once he arrived. In short order, he became a freelance computer consultant working with a company that was designing devices for the upcoming consumer electronics bus (CEBus). Typical applications of the technology were controlling lights in a house by remote control or using a home's electrical wiring for an alarm system.

Things were looking up for the Zimmermann family, but clouds were on the horizon: mushroom clouds. In 1980, Ronald Reagan was elected to office, and Zimmermann began to get nervous. "Reagan was in the White House. Brezhnev was in the Kremlin. Our side was building weapons that were designed to launch a first strike," he later recalled. Day by day, Zimmermann and his wife worried more about the possibility of nuclear war; the birth of their first child in 1980 made matters all the more urgent. To the couple, there seemed to be only one logical solution: emigrate to New Zealand.

"We thought it would be a hard life in New Zealand after a nuclear war, but we thought it might be still livable," he says. It was better than the supposed alternative in postwar America.

Zimmermann started obtaining the necessary passports and immigration papers for himself and his family. Everything was in order and ready to go by early 1982, when the couple heard about a conference being held in Denver by a group calling itself the Nuclear Weapons Freeze Campaign. They decided to go.

Zimmermann remembers the conference as "sobering but empowering." He heard a lecture by Daniel Ellsberg, the man who gave the Pentagon Papers to the New York Times. Ellsberg left Zimmermann feeling hopeful. The United States, after all, is a democracy. "It seemed plausible that this was a political movement that had some chance of success, of turning things around," he recalls. "And so we decided to stay and fight."

Soon after the conference, Zimmermann started hunting for books about military policy and weapons. He discovered a particularly good bookstore at a nearby mall and spent several hundred dollars. Zimmermann was going to become a self-taught military policy analyst. As soon as he finished the books, he started teaching his own course called "Get Smart on the Arms Race" at the Community Free School, a nonaccredited adult education center in Boulder. He made the rounds as a public speaker and started to train lobbyists and political candidates on issues of military policy and weapons technology. He was even arrested, along with Carl Sagan, Daniel Ellsberg, and more than 400 other protesters, at the Nevada nuclear testing grounds. "Direct action," he called it.

Politically, Zimmermann's years with the antinuclear movement were a success. Zimmermann's group helped get Tim Wirth elected to the U.S. Senate and another Democrat, David Skaggs, elected to Congress. But financially, Zimmermann couldn't have picked a worse time: he had just given up his lucrative business as a computer consultant in favor of starting a computer company with some of his friends. And startup companies, especially in the computer field, have a way of not putting food on the table.

Metamorphic Systems

In 1980, the most exciting personal computer in the world was the Apple II, manufactured by a new company in Cupertino, California, called Apple Computer. The Apple II had a full-size keyboard, fantastic graphics, and a fairly speedy microprocessor, the 6502. But as time passed, the Apple's 6502 seemed to run slower and slower. When IBM launched its new personal computer in 1981, it didn't use the 6502, but a new chip from Intel, the 8088.

Zimmermann's startup had a simple premise: build a single-board computer with an Intel 8088 that could plug into the back of an Apple II. That way, Apple II users could get the speed of the 8088, without having to give up their existing software. Zimmermann and his friends gave their company an appropriate name, Metamorphic Systems. Its headquarters was located in the kitchen of one of the founders.

By day, Zimmermann would work in his friend's kitchen, writing the basic input/output system (BIOS) of the new Metamorphic computer. At night, he would study military policy at home. And at the bank, Zimmermann's savings were draining away.

One day, Metamorphic Systems got a telephone call from a computer programmer in Arkansas named Charlie Merritt. Zimmermann picked up the phone. Merritt had seen the advertisements for Metamorphic Systems' computer and was excited by the machine's speed. Merritt needed speed, he explained to Zimmermann, because he was writing programs to do public key cryptography with an algorithm called RSA, and RSA was a pig with CPU cycles. At the mention of cryptography, something clicked in Zimmermann's mind.

Promoting Peace Discussed

By JANICE WHIPPLE
Times Correspondent

YANKEETOWN — Promoting peace was discussed by several Florida Presbyterian College students and the Parsons Memorial Church congregation in Yankeetown last week.

Alan Hulick of Marshall, Mo., son of a Presbyterian minister, stressed the need for communication. He agreed with a questioner concerning the destruction of property, saying that it was wrong, but, he added that lives were more important than buildings.

Walter Gooch of Clemson, S.C., urged economic boycott of industries such as cosmetic and cigarette, as a non-violent measure in an effort to stop the overseas combat.

Questions concerning communism brought the answer that lives were more important than the form of government. Hulick said, however, "I personally don't want to overthrow our government. The system we have now is good."

Kacie Cavanaugh answered a question concerning the suppression of Christianity under communism, by saying that Christianity was in the hearts and minds of the people and that suppression strengthens Christianity.

Rev. Terrance Peterson, pastor of the church, expressed satisfaction with the service which he said he believed encouraged communication between youths and adults even though they may not have been in agreement.

Lawn Lake shown one week before flood
...earth dam, shown above, gave way Thursday and flooded Estes Park

Flood creates extended stay for Rocky Mountain campers

By Steve Krizman
Colorado News Special

ROCKY MOUNTAIN NATIONAL PARK (AP) — An "over-nighter" next to a babbling brook became an extended stay in a campground much more secluded than a Longmont family would have liked.

Tony and Peggy Donovan awoke from their overnight stay in Rocky Mountain National Park to find the peaceful stream next to which they had camped had become a roiling torrent.

"We could hear it building, and it sounded like a freight train," said Tony Donavan, who along with his wife and two young daughters was among those camped at the Aspenglen campground.

It was sometime between 7 and 7:30 a.m. Within minutes, the campers were stranded on an island of wilderness.

"We watched the river rise and thought we were on pretty high ground," Peggy Donovan said. "Then the lady camping next to us informed us that there was water running through the campground behind us and that the water actually was on both sides of us."

"We headed for high ground, and waded through water up to our knees," Donovan said. From a safe vantage point they and their bewildered campground neighbors watched as the raging waters, propelled along Fall River after a dam broke four miles above them, tossed car-sized boulders, gnawed through a paved road and snapped tall pines "like a match stick."

Like the others still marooned in Aspenglen, the Donovans didn't know Thursday evening when or how they were going to escape their all-too-secluded mountain spot. They walked along the rubble-strewn road, skirted gaping holes, bypassed the defunct bridge over troubled waters and negotiated make-shift foot bridges to watch as U.S. Park Service crews tried to fashion a passable road back across Fall Creek to U.S. 34 and the road home.

Roasting hot dogs for dinner, the remnants of provisions intended to last them only one night, Donovan said he ould spend an extra night at Aspenglen. He said Park officials were not too optimistic when they could extricate vehicles.

For Kacie Cavanaugh, her husband and 2-year-old son, there was no pressing need to get back home, but she needed diapers. "You can't just go back and get diapers and other things you need," she said. "We don't like to backpack, and this is too much like it."

Others in the campground donated diapers to the cause, an example of how strangers stranded together pitched in to keep their situation more comfortable and even a little cheery.

If they complain, it's mostly to wonder why parks officials could not have notified them of the impending flood. Cavanaugh said a park ranger warned campers on an island in the campground, but did not move farther into the campground to warn others.

Most said their first hint that something was amiss was the sudden change in volume of the rushing river. A couple was awakened by water streaming through their tent.

"People were just running around," said Kevin Kolega of St. Joseph, Mo. His tent was just 15 feet from the river's edge.

"In looking back," said Cavanaugh, "I was sorry that more of us didn't think to yell and warn others." After the shock of the event was over, campers did got from tent to tent to make sure all were safe and had evacuated to higher ground, she said.

"You didn't really have time to get scared," she said. "but you just had the idea that you didn't know if you wree all of a sudden going to under 10 feet of water. But as it turned out, we had room to maneuver."

First on the scene, she said, were television news teams who landed in a nearby meadow in their helicopters.

Many of the campers heard of the cause of the flood through reports on Estes Park's radio station. Still, by afternoon, they were hungry for news from the outside.

Reporters, who had to hike into the area from Trail Ridge Road, often were interviewed themselves. "Did this really make the national news?" one asked. "Is that trail out of here very difficult?" inquired another.

All were shocked to hear that it was almost business as usual in the rest of the park.

The Park Service provided ice and food for those who needed provisions, while workers tried to bulldoze a crude road back to civilization. Campers who had to leave were airlifted out. By the afternoon, a makeshift path was available for those lucky enough to have a car on the other side of the river.

They spoke little of the three campers who had made it out, then disappeared in the floodwaters when they tried to retrjeve some belongings.

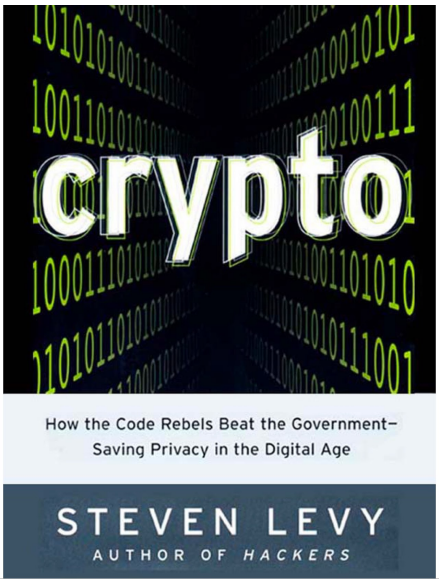
"Crypto, How the Code Rebels Beat the Government--Saving Privacy in the Digital Age" - Chapter 2

Chapter - crypto anarchy

See book at [HB000A][GDrive]



[HB000B][GDrive]

When Phil Zimmermann began his cryptography adventure, he had no idea that he would end up both hailed as a folk hero and investigated for violations of federal law. He acted out of scientific curiosity, a hobbyist's passion, and a bit of political paranoia. Born in 1954, and raised in various Florida towns, he was a self-described nerd, "not naturally a party guy." An odd, awkward duck. His father was a truck driver; both parents were alcoholics. He wanted to be an astronomer. In the fourth grade, though, he became captivated by codes. A Saturday afternoon Miami television show called M.T. Graves and the Dungeon had a kids' club. Members were sold a physical "key" to unscramble a secret code. During the show, a series of numbers were flashed on the screen and club members could use the key to translate them into magical, clear messages. Zimmermann never sent in the money to buy the key, but he jotted down the numbers anyway—and managed to decode them into plaintext. To an only child in a troubled family, transforming such gibberish into something familiar gave a sense of mastery, of belonging. A sense of an organized home.

No wonder Zimmermann sought to learn more about ciphers. He found a book by children's author Herbert S. Zim called Codes and Secret Writing. Published by Scholastic and directed at ten- to twelve-year-olds, this thin volume straightforwardly conveyed the excitement of cryptography, almost as if its author were a senior intelligence executive instructing a bright, though green, recruit. "The idea of this book is not to give you codes to copy but to help you invent your own codes—not one or two but, if you like, hundreds of codes," wrote Zim. "How you use your knowledge of codes is, of course, up to you."

The book became Zimmermann's Bible. He faithfully attempted all its exercises, such as making invisible ink out of lemon juice, creating original ciphers, and, of course, cracking the encoded messages presented in the book. A couple of years later, in junior high, a friend boasted of a code he'd made up and Zimmermann accepted the challenge of breaking it. "Make sure it's a long message," Zimmermann told the kid, who complied, foolishly thinking that a longer message would be harder to crack. The message was written in runic-style symbols, vaguely evocative of the languages of Tolkien's Middle Earth. Zimmermann did a frequency analysis, an elementary technique of cryptanalysis that simply involves counting how often alphabetic letters appear. This enabled him to solve it like a garden-variety cryptogram. All to the amazement of his buddy.

His interest in codes waned during his teenage years, and it wasn't until he was in college, at Florida Atlantic University, that Zimmermann realized computers could be cryptographic tools. Though he was majoring in physics, he wound up spending a lot of time in the computer room, at first doing course-related work, but eventually just drinking in the elixir of programming itself. The appeal was creating one's own world in the machine. "You could interact with something that wasn't a living thing but seemed to be like one," he says. Best of all, he was good at it, in contrast to his physics abilities. His nemesis: calculus.

Though he began programming his first week at college in 1972, he didn't actually see a real computer for a year, because his school only had terminals connected to distant machines. After all, Florida Atlantic wasn't MIT or Stanford. Not even a big state school. Zimmermann became a student assistant, teaching others to use the terminals. And after his second year, he dropped physics for computer science.

He rediscovered his passion for ciphers in that computer room. One of his experiments involved writing his own secret code, using the now-antiquated FORTRAN computer language. His scheme used random number functions to substitute each character in a plaintext message with a different character. The random number function was keyed with a password. Because his code couldn't be broken by frequency analysis (the randomizing function would change a "t" early in the message to one thing and subsequent "t's" to different characters), Zimmermann figured that not even the CIA could break it. He'd never imagined techniques like chosen plaintext attacks, or deconstructing random number generators. (And he'd never heard of the NSA.) As it was, years later he would encounter that same "unbreakable" cipher, presented in a student homework assignment as a cipher that could be easily broken with basic cryptanalytic techniques. "So much for my brilliant scheme," he says.

In the summer of 1977, with only one course to go before graduation and already employed at a minicomputer company in Fort Lauderdale, Zimmermann came across the Mathematical Recreations column of Scientific American, and found something that blew his mind. It was, of course, Martin Gardner's description of public key and the RSA algorithm. He was hungry to know more. Out of the blue, he called Ron Rivest at MIT and asked him about the

possibilities of implementing the system on a computer. Rivest told him that in the course of experimenting, the MIT group had already done that in LISP, a tony computer language used for artificial intelligence work. "That's out of my reach," said a disappointed Zimmermann, who had never had access to the flashy LISP machines; they were luxury items costing $100,000 and geared for research, not practical tasks like accounting. Though high-level arithmetic wasn't his strong point, Zimmermann understood that the odds of getting a LISP box at Florida Atlantic University approached infinity to one. He wondered, however, whether he could do RSA on one of those cheap new microcomputers. That would be different. Zimmermann had a partial share in one of the clunky low-cost machines of the time—it ran on a Zylog Z-80 processor, sort of the Model A of the mid-1970s. But as he thought about implementing RSA, he realized that he had little idea of how to do some of the extended arithmetic routines explained in the MIT paper. So he didn't try.

There were other things happening in Phil Zimmermann's life then. The same year he discovered RSA, he married his girlfriend Kacie Cavenaugh, who worked on the college switchboard. Not long afterward, the young couple visited friends in Boulder, Colorado, and fell in love with the area. Zimmermann returned to his Florida job but began planning for a move, and a year later he and Kacie packed up their Volkswagen Rabbit and drove to the Rockies. He got a job at a software company making workstation word processors, and began raising a family: their son was born in 1980. And then he heard Daniel Ellsberg speak at a nuclear freeze rally in Denver.

In high school, Phil Zimmermann had pretty much ignored Vietnam, but at Florida Atlantic he had come to adopt a passive but heartfelt antigovernment stance. The Nixon scandals had opened his eyes to how brazenly the government could lie. By the time of Ronald Reagan's presidency, he had totally soured on politics. He read Robert Scheer's With Enough Shovels, and worried about nuclear annihilation. Zimmermann and his wife decided to move to New Zealand, the better to avoid the coming holocaust. They went so far as to acquire passports and immigration papers. (He had yet to learn that there wasn't much of a computer industry in New Zealand.) And then he attended the 1982 rally where he heard Ellsberg, who, after his famous moment as the emancipator of the Pentagon Papers, had become a leading antinuclear activist. Zimmermann was galvanized. From that point on, he forgot about emigrating and decided to become active himself—to stay and fight.

He and some friends were starting a company they called Metamorphic Systems, and they planned to produce a circuit board for Apple computers that would run Intel-compatible programs. But Zimmermann still found time to dig into every book he could find on NATO policy, weapon systems, and the like. He would spend hundreds of dollars at a bookstore and tear through the volumes. Then he began teaching military policy at the Free University in Boulder. He spoke at nuclear freeze rallies and advised a couple of candidates for Congress. Twice he was arrested at rallies, once at the Nevada nuclear testing range, alongside his heroes Ellsberg and Carl Sagan. (Neither arrest resulted in any charges filed.)

But as the eighties moved on, the nuclear freeze movement seemed to lose steam. Metamorphic Systems wasn't doing well either: once the IBM PC became dominant, the idea of putting Intel processors into Apple II computers seemed kind of ridiculous. Zimmermann himself was a bit lost. But then, everything changed with a single phone call from a programmer in Arkansas who had a scheme few people could appreciate more than Phil Zimmermann.

The guy's name was Charlie Merritt, and it turned out that he was actually doing the thing that Zimmermann had dreamed of since reading Martin Gardner's column in 1977: he was implementing an RSA public key cryptosystem on a microcomputer. Merritt had experienced a similar reaction to Zimmermann's when he'd read about the work of the MIT researchers. Moving from his native Houston to Fayetteville, Arkansas, he started a company with several friends and they actually managed to create a public key program running on Z-80 computers. It ran very slowly, but it worked. But no one seemed to want to buy it. After a while, his friends dropped out, and Merritt, with his wife Hobbit, began selling the program themselves. Eventually news of their tiny enterprise reached the multibillion-dollar intelligence operation in Fort Meade. Periodically the NSA would send its representatives to Arkansas to warn Merritt of the dire consequences that might ensue if he sent any encryption packages out of the country. Since Merritt Software's customers were largely overseas companies that wanted encryption to circumvent the peeping thugs of corrupt regimes, this restriction virtually shut the company down. To try to get some domestic leads, Merritt was reduced to calling obscure companies he'd read about in computer magazines, hoping they would package his program with their stuff. That was how he found Metamorphic and Phil Zimmermann.

When Zimmermann heard what Merritt was up to, his excitement was so over the top that Merritt suspected a practical joke was being played on him: no one he'd ever met had been so nuts about encryption. Zimmermann told Merritt all about his own passion for crypto, about M.T. Graves and the Dungeon and Herbert Zim and Ron Rivest. He professed his hatred for Big Brother. But mostly, he wanted to know everything Merritt had learned about making RSA work on a personal computer.

Now that he knew it was possible to do so, Zimmermann became driven to write his own public key encryption program—for the people. Whereas his previous efforts in crypto had been solely performed as neat hacks, and as an expression of his passion for codes in general, he now was a sophisticated political activist who had twice been dragged off to a holding pen for asserting his opinion. He now understood that in the computer age, government had an extremely powerful tool for monitoring dissent: electronic surveillance. Not only could Big Brother types stick their collective ear into phone conversations, but they could pluck the increasingly popular e-mail messages out of the digital ether and read business plans and shameful secrets to their black, black hearts' content. While electronic mail was a terrific thing, it actually represented a step backward in privacy: even with relatively insecure physical mail, people had sealed envelopes to protect the privacy of their messages. What Zimmermann hoped to produce was the electronic equivalent to sealed envelopes. But if you gave people a crypto program to protect e-mail, you'd have something much better than sealed envelopes. If people all agreed to use it, he thought, it would be a form of solidarity, a mass movement to resist unwanted snooping. Right on, baby!

Understanding the speed limitations of public key, Zimmermann figured that his program should be a hybrid cryptosystem, using the slow public key RSA protocols to exchange keys and some other, speedier algorithm to perform the bulk encryption of the actual message. He was unaware of Lotus Notes, which was already implementing such a hybrid system, and was certainly in the dark about RSA Data Security, Inc., which was going to base an entire business on licensing public key for the kind of systems Zimmermann thought he was himself pioneering. (Neither did Zimmermann have a clue about the RSA patents.) In any case, neither of those firms had a shipping product in 1984.

Zimmermann did understand several things correctly: A useful program should run not just on a single brand of computer, but on all sorts of machines. To do this, it had to be written in a computer language that was amenable to all sorts of different processors, and as any programmer knew, the language that best satisfied that requirement was called C. Fortunately, Zimmermann knew C inside out. The program also had to be easy to use. And its circulation had to be so widespread that a near-ubiquity could quickly be realized. Thus it would benefit by the Network Effect.

Charlie Merritt was a holdout who still hadn't tackled C, but he was strong in an area where Zimmermann was sadly deficient: the complicated mathematics that enabled one to work with the huge numbers required by RSA. This was particularly important in implementing RSA on a personal computer, which used 8-bit "words" in its calculations: it was a challenging process to apply those relatively small numbers in a way that could process the mighty numbers that RSA demanded—512 bits, 1028 bits, and even more. If you didn't do it efficiently, the program would run so slowly that no one would ever use it.

Though no immediate business deal came of Merritt's call to Metamorphic, he and Zimmermann became constant telephone correspondents, with

Though no immediate business deal came of Merritt's call to Metamorphic, he and Zimmermann became constant telephone correspondents, with Zimmermann soliciting all of Merritt's knowledge of multiprecision arithmetic functions. It was such a complicated process that eventually they decided that Merritt should come to visit Zimmermann in Boulder for a sort of arithmetic boot camp, in November 1986.

It was an action-packed week, and not only because of the math that Zimmermann learned. Merritt was working on a project for the navy, producing a conventional cipher; he taught it to the younger man. The project had been subcontracted to Merritt by a company for whom he'd been consulting: RSA Data Security. Before he flew to Boulder, he'd called the company's new president to ask if they might meet in Colorado, a place that was a sight easier to get to than Fayetteville, Arkansas. Jim Bidzos agreed.

Bidzos had been looking forward to a testosterone-charged get-to-know-you dinner with Merritt—two guys in a steak house lighting cigars and swapping lies. Instead he found a third wheel was included, Zimmermann. And instead of a steak house, they wound up at The Good Earth, a brightly lit emporium of salads and grains.

The actual conversation at the restaurant would become a matter of dispute. Jim Bidzos later said he had been startled when Phil Zimmermann spoke of his plan to create a program that used RSA's proprietary protocols. In fact, RSA had a similar program, and Bidzos had brought along two copies. This was Mailsafe, written by Rivest and Adleman, two guys who by now had more math and cryptography knowledge in their little fingers than Zimmermann had managed to glean from Merritt in two years. Zimmermann, however, would claim that Bidzos was impressed with his plans, so much so that he offered the programmer a free license to the RSA algorithm. Bidzos would later vociferously deny making any such offer.

In any case, Zimmermann saw no reason to change his own plans, and he spent the next few years furthering his didactic education on cryptography so he could complete his own encryption program. He wrote up some of his ideas in a paper that was published, to his pride, in IEEE Computer, a wellregarded computer-science journal. Not bad for a kid from Florida Atlantic University.

Then he began working on the actual program. One crucial step was producing the bulk encryption algorithm that would perform the actual encoding of message content. Eschewing DES and the RSAowned RC-2 standard devised by Ron Rivest, he attempted the risky course of producing his own cipher. It was based on the one that Charlie Merritt had taught him, the cipher Merritt had produced for the navy. But Zimmermann toughened the system by introducing multiple rounds of substitution. As he refined his concept, he recalled a Dan Aykroyd routine from the original Saturday Night Live television show. Portraying a fast-talking late-night huckster, Aykroyd hawked a blender so powerful that you could throw a fish into it: the liquefied output would be a healthy juice (yum). This was the Bass-O-Matic, a perfect name, Zimmermann figured, for an encryption algorithm. Any cryptanalyst who confronted his scrambled messages would be as ineffectual at reconstructing them, he hoped, as someone attempting to reconstitute a silvery, flopping fish from the noxious goo emerging from the Bass-O-Matic blender.

Zimmermann went on to other problems, and pieces fell into place—message digests, interface, and a range of protocols. But after months and months of work, all he really had were separate components that still weren't tied together into a working program. "It took a lot more work to put them together," he says. By 1990—six years after first talking to Charlie Merritt and four years since Merritt's visit to Boulder— Zimmermann realized that in order to finish he would have to make a total gung-ho commitment, even if it meant having to tighten his budget, cut out the consulting, and spend less time with his family. He embarked on a full-time regimen of programming.

Zimmermann had dreamed up a name for his work in progress, though not one as irreverent as Bass-O-Matic. Zimmermann had been an early devotee of the Macintosh computer, and had experimented with a simple data communications program when none had existed. Thinking of "Ralph's Pretty Good Grocery," an imaginary sponsor from Garrison Keillor's A Prairie Home Companion radio show, he had called it "Pretty Good Terminal." This gave him the idea for the name of his crypto program: Pretty Good Privacy. He never really considered that it might become a major brand name. But then, his marketing plans were vague. He did hope to make some money selling PGP, but figured on a modest amount using shareware rules, where people would download the program and pay him on the honor system.

For the next six months, Zimmermann worked twelve-hour days in a bedroom of his house, which he almost lost because he didn't have the money to make the mortgage payments. Maybe, he figured, if he finally finished PGP and released it, enough users would send him money to get him back on his feet. As the software got closer to completion, he called Jim Bidzos to see if they could finally clear up the intellectual property issue that the RSA chief had brought up during that ill-fated dinner. Zimmermann explained his product and asked for a go-ahead to use the RSA algorithm. Bidzos was appalled at the request: this guy thinks we'll just give him our crown jewels? Maybe instead of asking for handouts, he suggested, Zimmermann should develop his product for some company rich enough to get a standard RSA license.

The whole conversation was so out of line with Zimmermann's vision for his product—and the dim view he took of the high-powered business world—that he basically ignored the whole problem and went back to work.

By early 1991, Zimmermann was making progress toward a working product. Then something happened to change his course—and to make PGP famous. The unlikely agent in this shift was U.S. Senator Joseph Biden, the head of the Senate Judiciary Committee and a cosponsor of pending antiterrorist legislation, Senate Bill 266. In a draft of the bill introduced on January 24, Biden inserted some new language:

> It is the sense of Congress that providers of electronic communications services and manufacturers of electronic communications service equipment shall ensure that communications systems permit the government to obtain the plaintext contents of voice, data, and other communications when appropriately authorized by law. [Emphasis added.]

A poison needle in a haystack of clauses and qualifications, this passage originally escaped scrutiny. But its appearance was no accident. The language of the bill had been forged with the help of law enforcement agencies. That sentence was included at the explicit request of the FBI. And what a sentence it was! It plunged a virtual dagger into the heart of the crypto revolution. How could tech companies and services promise to deliver the plaintext contents of encrypted texts—the original messages meant to be read only by their intended recipients—if people scrambled them with programs like Mailsafe, Lotus Notes, and PGP? Logically, the only way that the "sense of Congress" could be satisfied would be a ban on any encryption except that equipped with "trapdoors" that the manufacturers and services could flip open at the demand of the feds.

It wasn't until April 1991, however, that the crypto community itself learned of this legislative time bomb. A consultant who had done work for the NSA revealed the offending clause on various Internet bulletin boards, along with apocalyptic commentary: "Are there readers of this list that believe that providers of electronic communications services can reserve to themselves the ability to read all the traffic and still keep the traffic 'confidential' in any meaningful sense? . . . Any assertion that all use of any such trapdoors would be only 'when appropriately authorized by law' is absurd on its face. . . . Any such mechanism would be subject to abuse." The message ended with a warning that would galvanize Phil Zimmermann: "I suggest you begin to stock up on crypto gear while you can still get it."

To Zimmermann, S. 266 was the ultimate deadline. If he didn't get PGP out into the world now, the government might prevent its very existence. At least for the time being, domestic crypto was legal. So Zimmermann decided to finish up the first version of PGP quickly and get it out to as many people as possible. He also gave up his financial hopes for PGP. Instead of releasing it as shareware, he designated it "freeware." This meant not only that the software didn't cost anything, but also that users could themselves distribute it far and wide to others with the blessing of its creator.

Fortunately, a medium existed that made it easier than in any time in history to circulate an encryption system like PGP: the Internet. In 1991, the formerly government-owned computer network was just beginning its meteoric rise to ubiquity. Thousands of discussion groups abounded, and millions of files were downloaded every day. The majority of users at the time did not yet reflect the public at large— most were very computer savvy, and a lot of them were outright nerds. But these were exactly the types of people who would respond to PGP, which, despite Zimmermann's best efforts, was still not as easy to use as MacWrite or Tetris.

Oddly, at that time, Zimmermann himself was not much of an Internet devotee. He hardly knew how to use e-mail. In this sense he was still the outsider looking in. But in recent months he had begun a correspondence with a fellow crypto enthusiast in California, Kelly Goen, whom he had met through Charlie Merritt. In the month after the on-line call to action about S. 266, Zimmermann apparently gave Goen a copy of his PGP software so that it could be spread on the Internet "like dandelion seeds," Zimmermann later wrote. On May 24 Goen e-mailed Jim Warren, a computer activist and columnist for MicroTimes, a Bay Area computer-oriented newspaper, and explained the purpose of flooding the networks with PGP. "The intent here," wrote Goen, "is to invalidate the so-called trapdoor provision of the new Senate bill coming down the pike before it makes it into law." In other words, if thousands of copies of PGP were in use, Senate Bill 266 would be rendered irrelevant; when confronted with PGP-encrypted files, the AT&Ts of the world would not be able to guarantee plaintext to G-men or spooks.

On the first weekend in June, Jim Warren got a series of calls from Goen, who told him that PGP day had arrived. Goen was obviously intoxicated with the drama of it all, taking precautions that were more from the book of Maxwell Smart than James Bond. "He was driving around the Bay Area with a laptop, acoustic coupler, and cellular phone," Warren later wrote in MicroTimes. "He would stop at a pay phone, upload a number of copies for a few minutes, then disconnect and rush off to another phone miles away. He said he wanted to get as many copies scattered as widely as possible around the nation before the government could get an injunction and stop him."

Apparently, Goen was also careful to upload only to Internet sites inside the United States. Of course, once a software program appears on a file server, anyone in the world can download it: Pakistani hackers, Iraqi terrorists, Bulgarian freedom fighters, Swiss adulterers, Japanese high schoolers, French businessmen, Dutch child pornographers, Norwegian privacy nuts, or Colombian drug dealers. Though not yet a cliché, an Internet slogan was already becoming a familiar refrain: On the Information Highway, borders are just speed bumps.

How quickly did PGP leave the United States and find its way overseas, without as much as a howdydo to the export laws? Instantly. Zimmermann would later marvel at hearing that the very next day people in other countries were encrypting messages with PGP. How could Zimmermann have avoided this potentially illegal passage of his program to distant shores? "I could have not released it at all," he later said. "But there's no law against Americans having strong cryptography." And, after all, Phil Zimmermann engineered his sudden release of PGP not to circumvent export laws, but to arm his countrymen, the people who might be affected by Senate Bill 266. His motto, as expressed in his documentation to the program, was "When crypto is outlawed, only outlaws will have crypto."

Ironically, Joseph Biden's offending language, the impetus for Zimmermann's extraordinary step, met a much less enthusiastic response than PGP did. Senator Biden had been taken by surprise at the huge expression of public outrage (fueled by civil liberties groups) at the stealth antiprivacy language he had introduced. By June, he had quietly withdrawn the clause. But the incident left an unexpected legacy: hundreds of thousands of PGP-encrypted messages circulating throughout the world. Pretty Good Privacy had escaped from Phil Zimmermann's hard drive and had now been cloned countless times. He could no more recall it than one could take back one's words after they were uttered.

Zimmermann was proud of PGP 1.0 though defensive at its shortcomings. Maybe it didn't introduce any mathematical innovations. And maybe the coding was so disorganized that he felt compelled to apologize for it in the documentation. But it was one of the first really usable personal computer solutions for a complete cryptosystem, from digital signatures to encryption. "If you look at what was available at that time, there were only laboratory petri-dish versions of RSA," he says. "One had been published in Byte; it took all afternoon to do an RSA calculation. Mine did that in a few seconds. I had brought together a practical implementation that had all the things you needed to do public key cryptography. It was a major event . . . it was a watershed event."

One person disagreed strongly: Jim Bidzos of RSA and Public Key Partners. When he saw PGP, he was outraged. This was no original product, he felt—look at Mailsafe—but a blatant rip-off of his company's technology and patents. Why didn't Zimmermann get honest and call it Pretty Good Piracy? Bidzos called the Colorado programmer and, literally screaming at him, demanded he remove the software from circulation. Despite all Bidzos's previous animosity, Zimmermann was actually taken aback at this response: "I thought he would be delighted," he says. He attempted to defend himself. He had done PGP for political reasons, not to challenge any commercial enterprises. After all, the Fortune 500 companies that were RSA's potential customers don't use freeware; they buy their software from companies that will back it up and support it. So what was the problem?

Bidzos accused him of actually playing into the NSA's hands—because anything that hurt his company was music to Fort Meade.

Not long afterward, Bidzos had his lawyer put Zimmermann on legal notice that he was infringing on PKP's patents. This worried Zimmermann, and he called Bidzos once again to try to make a deal. The basis of the agreement was simple: Zimmermann would not distribute his software with the RSA protocols, and Bidzos would not sue him. An agreement was indeed drawn up to that effect, and Zimmermann signed it. But each party had his own interpretation of that phone conversation. Bidzos felt that the deal compelled Zimmermann actually to kill PGP. Zimmermann insisted that he had only affirmed his understanding of a hypothetical agreement: if he stopped distribution of PGP, then he would not be sued. Zimmermann would also claim Bidzos gave him verbal assurances that RSA would sell licenses to PGP's end-users so they could use the software without infringing on RSA's patents. Bidzos denied those claims.

It later became clear that Zimmermann's interpretation of "distributing PGP" was somewhat narrow. By leaving the distribution to others, he felt that he was free to continue his involvement with the software. In fact, Zimmermann was supervising a second release of PGP, this one with the help of some more experienced cryptographers.

He'd realized that he needed help after a sobering experience at Crypto '91 in Santa Barbara. His main mission had been to get a reading from the wizards there on the security of PGP. (Admittedly this task was overdue, considering that thousands of people were already using the program.) Right away, he ran into Brian Snow, one of the top crypto mathematicians at the NSA. Zimmermann, of course, was curious as to whether the government was upset about PGP. "If I were you, I would be more concerned about getting heat from Jim Bidzos than from the government," said Snow.

This puzzled Zimmermann—why wasn't the government worried? Then he sought private comments on his program. After first getting a brush-off from Adi Shamir—the Israeli cryptographer told him to send the program to Israel and he'd spend ten minutes with it—Zimmermann got the attention of Shamir's colleague at Weizmann, Eli Biham. They retreated to the UCSB cafeteria, scene of many a bull session and impromptu cryptanalysis at the annual conference. For Zimmermann, it was a long lunch in more ways than one; Biham quickly embarrassed the amateur cryptographer by uncovering several fatal flaws in Bass-O-Matic. The cipher was, for instance, vulnerable to a differential cryptanalysis attack. While not exactly a dead fish, the Bass-O-Matic was far from a prize catch.

Zimmermann now realized that he could only truly improve PGP if he were to recognize his own limitations. His ultimate success at codemaking would come from realizing that he wasn't really a great cryptographer. He was a knowledgeable packager and programmer who would need ace mathematicians and cryptographers to help him with the hard-core details.

Fortunately, a lot of very smart people had been excited by the release of PGP 1.0. Instead of feeling burned by its weaknesses, they were eager to pitch in and fix them. Soon Zimmermann had recruited volunteers in New Zealand, Holland, and California to be his mainstay engineers. A casual collection of kibitzers also contributed advice and small pieces. Together they began work on version 2.0. Zimmermann was the chief designer, approving every decision, every line of the code, but he hid his role so that Bidzos wouldn't think that he was abandoning his promise not to violate RSA's patents.

The result was PGP 2.0, an infinitely stronger product. Bass-O-Matic had been tossed aside ("Calling it that wasn't too good an idea, anyway," says Zimmermann. "Cryptography is something you can't joke about"). In its place, Zimmermann chose a preexisting Swiss cipher called the International Data Encryption Algorithm, or IDEA. Written in 1990 by two celebrated cryptographic mathematicians, IDEA had quickly stood up to public scrutiny. Zimmermann felt the IDEA cipher was even stronger than DES, particularly with the 128-bit keys he recommended. "This is not," he wrote in the 2.0 documentation, "a home-grown algorithm."

Another crucial improvement came in an area that Zimmermann basically had ignored with PGP 1.0: key certification, the process by which public keys are authenticated. Certification is often seen as the Achilles' heel of public key systems. The classic conundrum in such systems arises when Alice wants to send something to Bob. She scrambles it with Bob's public key, and only Bob can unscramble it. But what if Alice has never met Bob—how does she get his public key? If she asks him for it directly, she can't encode her request (obviously not, because she doesn't have his public key yet, which she would use to encrypt the message). So a potential eavesdropper, Eve, could act as "a man in the middle," and snatch that message en route. Then Eve, pretending to be Bob, could send her own public key to Alice, falsely representing it as Bob's key. (This deceptive masquerade is known as "spoofing.") If Alice is duped, she'll encode her secret message to Bob with the key. Alas, Bob won't be able to read anything scrambled with that key—only tricky Eve can. So much for the security of direct requests.

What about the idea of publishing something like a digital phone book full of public keys? The forging problem persists, unless you have a certifiably secure means of protecting that book and assuring that the keys really do belong to their purported owners. Yes, it would require an extravagant effort to pull off such a fraud. But it's possible, and as long as the vulnerability exists, any public key system has to figure out a way to get around this security hole.

Many people have come to think that the answer lies in a large-scale "certification authority" to distribute and verify public keys. Such a center would be able to process millions of public keys. Using the certification authority's own public key—presumably a key so well-circulated that no one could spoof it—you could securely query it to get someone's key, or verify a public key someone sent you. Of course, such an ambitious solution was impossible for Zimmermann. He didn't have the wherewithal, or money, to set up a closely monitored certification authority to distribute and verify public keys. So he had to come up with another method.

His solution was quite ingenious, especially since it reflected the outsider sensibility that generally characterized his efforts. Instead of a central key authority, he envisioned the PGP community itself as an authority. "PGP allows third parties, mutually trusted friends, to sign keys," explained Zimmermann in a 1993 interview. "That proves that they came from who they said they came from." By "signing" keys, Zimmermann was talking about a technique whereby someone in effect attached his or her own public key to someone else's, as a sort of stamp of approval. After you generated a public key, you'd get the key signed by people who knew you personally. These signings were to be performed face-to-face, to minimize the threat of spoofing. So if Alice knows Bob personally, she arranges to meet him, and physically hands him a disk with her PGP public key. Using his copy of PGP, Bob signs it with his own private key. (This is done simply by selecting a function in the software program and clicking the mouse.) He gives her back the signed key and keeps a copy for his own "public key ring," a collection of signed keys that PGP users are encouraged to keep on their hard drives. Later, a third party, Carol, might want to communicate with Alice but doesn't know her. So Carol seeks out Alice's public key, either from her directly or from a bulletin board full of public keys. In the latter case, how does she know it's really Alice's? She checks to see who has signed the key—does it have the imprimatur of anyone she knows? Since Carol knows Bob—and has earlier received a verified copy of Bob's public key—she can establish the veracity of his signature. If it checks out, that means that Bob has really met the person who holds this new key and is implicitly telling Carol, "Hey, it's really Alice." So Carol can be sure that Alice is who she says she is. At least to the degree she trusts Bob.

This system—known as a "web of trust"—requires some judgment on the user's part. After all, Carol can't be sure of Alice's identity unless she personally knows someone who has physically met her and signed her key. What if she doesn't know anyone who's physically signed it? Is it worth trusting a second-level verification? Maybe her friend Bob hasn't signed Alice's key, but he has signed a key of someone named Ted. And Ted has signed Alice's key. Whether you'll trust that signature depends on Ted's reputation: who are the people who have signed his key? As more and more people used PGP, some were bound to develop a reputation for being scrupulous in verifying the keys they sign. Seeing one of those trusted introducers on a key ring would be a strong assurance of authenticity. In any case, PGP allowed users to set what cryptographer Bruce Schneier refers to as "paranoia levels": how many levels of separation you're willing to accept, depending on the degree to which you trust various signers.

With this web of trust, a stronger encryption algorithm, a better interface, and a number of other improvements, PGP 2.0 was—unlike Zimmermann's favorite weekend comedy show—ready for prime time. The informal team of programmers had even prepared translations of the interface in several languages, so people worldwide could use it from the day of release. In September 1992, two of Zimmermann's helpers posted PGP 2.0 on the Net from their respective homes in Amsterdam and Auckland. This way, the program could be imported into the United States, violating no export regulations. In almost no time, the new version supplanted and exceeded the first one. "I got more mail in the month after the release than I had received the whole previous year," says Zimmermann. "It was like lighting a match to dry prairie grass."

Jim Bidzos became, if possible, even angrier. He was particularly outraged at a contention of Zimmermann's included in the documentation that came with every download of PGP. Zimmermann claimed that Public Key Partners was ripping off the American public by making people pay for technology developed on the government dime. After Zimmermann's attempts to cover himself with disclaimers ("The author of this software implementation of the RSA algorithm is providing this ... for educational use only ... Licensing this algorithm from PKP is the responsibility of you, the user, not Philip Zimmermann ...") he

is providing this ???for educational use only.??? Licensing this algorithm from PKP is the responsibility of you, the user, not Philip Zimmermann.???), he launched into a long justification of his actions, claiming that he didn't think he was infringing on any patents. He implied that by controlling the patents to public key cryptography, Public Key Partners—"essentially a litigation company," he called it—was doing the NSA's dirty work by denying crypto to the people! Finally, while not giving any assurances, he told potential users that they didn't have much to worry about by violating PKP's patent rights: "There are just too many PGP users to go after," he wrote. "And why would they single you out?"

"He's misleading people, defaming us as a way of getting support for his own agenda," said Bidzos in 1994. "There's the evil government trying to deny you your right to privacy and the evil patent holders bent on ripping you and the government off—it's not really clear who's worse, but you can put them both off by using this software. He knew it was false."

Bidzos did have a point: RSA itself had already produced Mailsafe, an implementation of the public key patents. Both parties agree that during the contentious 1986 dinner meeting, Bidzos gave Zimmermann a copy of Mailsafe, but Zimmermann claimed he never tested the software or read the documentation because he'd already figured out how his product would work. "This guy says he was blown away by the invention of RSA," says Bidzos. "We're supposed to believe that he took software written by the people who invented it, his heroes, and never was curious enough to look at it?"

Yet much of Bidzos's fury was directed not just at Zimmermann's actions but at the runaway popularity of PGP. Because it was free, available worldwide regardless of export laws, and had quickly attained a patina of coolness among the high-tech crowd, its usership quickly exceeded that of Mailsafe, and was now threatening to become an Internet standard. Despite not being an accomplished cryptographer with a Stanford or MIT pedigree, despite having virtually no sense of business or marketing, Zimmermann had done what neither the original world-class public key mathematicians nor the market-savvy Bidzos had succeeded in doing: create a bottom-up crypto phenomenon that not only won over grassroots users but was being described as the major challenge to the multibillion-dollar agency behind the Triple Fence. No wonder that by the end of 1992, Phil Zimmermann had gone from total obscurity to the hero of the crypto underground. "If I go to Europe, I'll never have to buy lunch," he said. "I have a huge number of adoring fans."

Zimmermann's do-it-yourself effort to create a crypto program and distribute it to the people—an effort consciously undertaken to circumvent government control—marked a new dimension in the ongoing battle between the NSA and the cryptographers who worked outside its reach. The agency had once felt that its voluntary prepublication compromise with academics had mitigated much of the potential damage of that community's emergence. (And with the troublesome First Amendment in play, there was little choice in the matter.) Fort Meade's minions were also fending off the commercial threat to its dominance by budging only slightly on the export situation.

But it was getting harder to convince people that it made sense to control cryptography. It was becoming increasingly clear that this was not a weapons technology but one that might fit in as a common artifact of everyday life. All those millions who used Lotus Notes were already aware of its benefits. Those with garden variety e-mail were shocked to find that basic protections just weren't there—sending mail on the Internet seemed secure but was actually one step removed from broadcasting. And as more people began using cellular phones, for instance, they wondered why it was that their calls could be so easily monitored by any wirehead who plunked down a hundred dollars for a scanner. Even the Prince of Wales had his cell calls to his mistress intercepted, with the whole world now chuckling at endearments he uttered to her, endearments that were intensely personal (OK, they involved menstruation supplies). In a world of highly evolved communications, why shouldn't everything be protected? Even the National Football League figured this out: it used crypto to encode the radio signals sent from coaches in the observation booth to quarterbacks on the field. This was something anyone could understand. Here was something as straightforward as a means to prevent the Green Bay Packers from stealing the next play from John Elway . . . and we called this national security?

These were tough questions for a branch of government not used to answering any questions at all. Butthe questioning was about to become more intense as a new force, in part inspired by Zimmermann, now came into play: cryptoactivism. Strong cryptography distributed on the Internet—and a revolutionary movement built around producing and distributing strong codes—seemed on its face a fringe activity. But with the crypto controversy heating up, it turned out that the time was ripe for a small movement to apply leverage.

So it seemed to two crypto enthusiasts who hatched an idea for a group that would be outside even the outsiders in the battle for cryptography. The concept developed spontaneously when Eric Hughes, a young mathematician living in the north Bay Area and thinking of moving down the California coast, visited his friend Tim May in Santa Cruz to do some house hunting.

Hughes and May were an interesting combination, bound by scientific passion, political libertarianism, and a slightly unnerving paranoia. (Hughes liked to joke about this, citing an unknown philosopher who supposedly said, "Cryptography is the mathematical consequence of paranoid assumptions.") Both cut striking figures, eschewing a math-nerd look for the frontier garb of the Old West: crypto cowboys. Hughes was often seen in a felt Stetson.

At forty, May was a physicist who had retired from Intel seven years earlier with a bundle of stocks. His major contribution at the semiconductor giant had been his proof that quantum events—the meanderings of subatomic particles—could affect the calculations performed by semiconductor chips. May's discovery allowed Intel's designers to devise strategies to deal with this problem, enabling the steady progress of Moore's Law. Outside of technology, May was an advocate of libertarianism, as opposed to government restrictions. "I got converted by reading Ayn Rand as a kid," he says. "I would write polemics about natural rights in class." As an adult he posted such polemics—intentionally provocative and highly entertaining rants—to Usenet groups, and his hard-core advocacy of unbridled cryptography had earned him an edgy reputation. A slim, bearded man who often wore an outback hat, he owned a small house cluttered with books, gadgets, and well-fed cats.

A semilapsed Mormon from Virginia, Eric Hughes had a long, wispy light-brown beard, aviator wirerimmed glasses, and a cold, sarcastic wit. Not yet thirty, he was brimming with attitude. But his cocky sureness was tempered with a steady intelligence that enabled him to understand both sides of an issue.

He loved cryptography. He'd studied math at Berkeley, and worked for a company overseas for a while. Now, at the dawn of the Internet, he was figuring out how he could use codes to fortify the information age. His ultimate goal was combining pure-market capitalism and freedom fighting. In his world view, governments—even allegedly benign ones like the United States—were a constant threat to the well-being of citizens. Individual privacy was a citadel constantly under attack by the state. The great miracle was that the state could be thwarted by algorithms. "It used to be that you could get privacy by going to the physical frontier, where no one would bother you," he said. "With the right application of cryptography, you can again move out to the frontier—permanently."

As radical as Hughes's vision was, it paled in comparison to that of his Santa Cruz friend. When Tim May thought about crypto it was almost like dropping acid. In the computer age, we create "virtual regions," he would say. And the conduits and pipes of the future, the very mortar and walls of those virtual spaces, could be held up by nothing but crypto. Oh, God, May would burst out when speaking of this vision, it's so profound. There's nothing else! One-way functions like the ones exploited by Diffie, Merkle, and Rivest were the building blocks of cyberspace, he insisted, and if we don't use them we would be reduced to pathetic shivering creatures standing in the ashes of a virtual burned-out house. But with it, everything is imaginable. Secure conduits—

untappable by the NSA!—from hackers in Los Gatos, California, to activists in St. Petersburg, Russia. Transactions beyond taxation. And an end to the nationstates. That was the coming revolution, according to Tim May.

Such were the topics discussed in May 1992 during Eric Hughes's house-hunting visit to Tim May. There was so much to talk about that the conversation lasted for three days. "We'd get up in the morning and just keep chatting and chatting and I wouldn't get anything done about looking for a house," says Hughes. "And we'd go out to lunch and come back and keep going. It just went on and on." By the end of the visit—not surprisingly, Hughes had made no progress in finding a house and went back to his shared crashpad in Berkeley—they agreed to organize a loose confederation of those with similar views. Not to sit around and bullshit, but to actually produce, à la Zimmermann, the tools that would arm the general public against cyberthieves, credit bureaus, and especially the government.

In the next few weeks, they enlisted the aid of some influential figures in the antigovernment crypto community. One forceful ally was thirty-seven-year-old John Gilmore, a gentle computer hacker with long thinning hair and a wispy beard (when he stood beside Eric Hughes, the two of them looked like a geeky version of the cough-drop-icon Smith Brothers). Gilmore had made a small fortune from being one of the original programmers at Sun Microsystems—he had been employee number five—but left in 1986. In 1990, along with Mitch Kapor and Grateful Dead lyricist John Perry Barlow, he'd founded the Electronic Frontier Foundation (EFF) to enforce civil liberties in the digital age, and had just started a new company called Cygnus Support, devoted to aiding users of free software. His hobby-horse was personal privacy. At a 1991 conference called "Computers, Freedom, and Privacy," he delivered a speech that anticipated the thoughts of Mays and Hughes—a people's crypto movement to stave off the government.

> What if we could build a society where the information was never collected? Where you could pay to rent a video without leaving a credit card or bank account number? Where you could prove you're certified to drive without giving your name? Where you could send and receive messages without revealing your physical location, like an electronic post office box? That's the kind of society I want to build. I want to guarantee—with physics and mathematics, not with laws—things like real privacy of personal communications . . . real privacy of personal records . . . real freedom of trade . . . real financial privacy . . . [and] real control of identification.

Gilmore was particularly interested in making sure that information about crypto found its way into the public domain. (He had been the one who had used the Internet to circulate Ralph Merkle's fastencryption paper after the NSA had asked Xerox not to publish it.) More recently, he had been trying to liberate four early cryptanalysis textbooks by the NSA's legendary wizard William Friedman, filing Freedom of Information (FOI) requests to have the fifty-year-old works declassified. He even hired a Berkeley lawyer to help him negotiate the complicated process and file suit when government agencies did not respond within the specified legal time period.

Not long after demanding the Friedman texts, Gilmore began an extensive bibliographic search for them on the Internet, using "know-bots," which were automated intelligent search programs. The bots indicated that copies of two Friedman codebreaking works were publicly accessible, one in the Virginia Military Institute library, the other on microfilm at Boston University. Apparently at one time the government had lifted the restrictions on them, but in the Reagan era they had once again been classified. Gilmore immediately got friends to send him copies and notified the judge hearing his FOI appeal that the texts were on public library shelves. The government responded by notifying Gilmore that any further distribution of the Friedman texts would violate the Espionage Act, which mandated a possible ten-year sentence for violations. In other words, Gilmore could be sent to Leavenworth for a decade, just for taking a book out of the library and sharing it with friends. Gilmore not only notified the judge that his First Amendment rights were being violated, but told his story to a local reporter.

Two days later, the government backed down, formally declassifying the two texts. But Gilmore persisted in asking for the other works, and requested that the judge declare the Espionage Act itself an unconstitutional suppression of free speech. When a reporter asked him if his stance might not weaken national security, he was unrepentant. "We are not asking to threaten national security," he said. "We're asking to discard a Cold War bureaucratic idea of national security which is obsolete. They're abridging the freedom and privacy of all citizens, to defend us against a bogeyman that they will not explain."

Working with Gilmore (only later did Whitfield Diffie agree to participate as a sort of éminence grise), Hughes and May began planning a physical meeting of the proposed movement. Hughes was then calling the group CASI, or Cryptology Amateurs for Social Irresponsibility. Hughes and May prepared all summer, setting the invitation-only event for September 19, 1992, at Hughes's house in Berkeley. Because the nature of the enterprise involved an implicit attack on the government's most powerful spy agency, it was decided that discretion should be the watchword.

The meeting exceeded everyone's expectations. Unlike the Birkenstocked academics and rubbernecking spooks who met at the Crypto conferences, the twenty or so in attendance were people who saw cryptography totally outside the context of their own careers (if indeed they had one, as some did not). Their main concern was how people would and should use crypto tools. Their politics were heavily libertarian; more than a few were also self-proclaimed Extropians, whose philosophy merged an extremist view of individual liberties with a loopy belief that the far fringes of scientific research would soon accrue to our benefit. (Topics that made Extropians giddy included nanotechnology, cyborgs, and cryogenics; some Extropians had signed up to have their heads posthumously frozen, to be thawed and revived in some distant century.)

But it would be a mistake to misjudge this group by their peccadilloes or by the modest turnout at this first meeting. In fact, they would wind up becoming so influential that their grandiose fantasies would be vindicated. Profane, cranky, and totally in tune with the digital hip-hop of Internet rhythm, they were cryptographers with an attitude. If the government hadn't enough to worry about with industry, privacy advocates, and reform-minded policy wonks urging liberalization of encryption, the emergence of crypto rebels as popular culture heroes was a tipping point, an unexpected sign that the code wars had gone someplace new. The code rebels had arrived, brandishing a powerful intellectual weapon: crypto anarchy.

For this first meeting, Tim May had produced a fifty-seven-page handout, along with an elaborate agenda including discussion of "societal implications of cryptography," "voting networks," and "anonymous information markets." There were reports on digital money in virtual realities and John Gilmore's assessment of the NSA. And there was time set aside, of course, for the "reading of manifestos." Tim May had one prepared especially for the meeting, which he called the Crypto Anarchist Manifesto. It ended on a stirring note:

> Just as the technology of printing altered and reduced the power of medieval guilds and the social power structure, so too will cryptologic methods fundamentally alter the nature of corporations and of government interference in economic transactions. Combined with emerging information markets, crypto anarchy will create a liquid market for any and all material which can be put into words and pictures. And just as a seemingly minor invention like barbed wire made possible the fencing-off of vast ranches and farms, thus altering the concepts of land and property rights in the frontier West, so too will the seemingly minor discovery out of an arcane branch of mathematics come to be the wire clippers which dismantle the barbed wire around intellectual property. Arise, world; you have nothing to lose but your barbed-wire fences!

For a couple of hours, people were invited to play "the Crypto Anarchy game," a role-playing exercise in which people imagined using exotic crypto protocols

to keep surveillants in the dark about their activities, such as passing secrets or doing drug deals. Since PGP 2.0 had been released only days before —and most in attendance were huge fans of the first version—much of the meeting was spent discussing Phil Zimmermann's latest effort, and copies were distributed to all in the room. (Zimmermann himself was still in Boulder.) The event turned into a key-swapping party, as everyone exchanged PGP public keys and signed one another's key ring. PGP, after all, was the embodiment of the group's belief that cryptography was too important to be left to governments or even well-meaning companies. Only dedicated individuals, willing to suffer the consequences of government sanction, could assure that the tools got circulated into the Internet's bloodstream. After that, John Gilmore said, "It would take a pretty strong police state to suppress this technology."

One unexpected highlight was an observation made by Hughes's companion, a leather-clad writer who penned articles for the digital hippie magazine Mondo 2000 under the name St. Jude. Listening to the visions of overturning society with modular arithmetic, she made the connection with the recent rise of socalled cyberpunks—hackers turned hipsters by linking the in-your-face iconoclasm of punk-rock rebels with the digital revolution. "Hey," she called out, "you guys are cypherpunks!" They all loved the name.

The newly dubbed group was eager to meet again in a month. In the meantime, Eric Hughes set up what would be a much more robust and fertile cypherpunk gathering place: the Internet. Using John Gilmore's server (its Internet domain name was toad.com) as a cyberspace hub, Hughes set up what was known as a list-serv, an ongoing mega-discussion where anyone who signed up for the list would receive, unfiltered, the e-mail contributions of any other member who cared to report news, critique a cryptosystem, or unleash a rant. Within a few weeks, over 100 people would sign on to the list, an impressive number considering the mind-numbing volume of messages passed—often well over 150 a day.

After that first meeting, Eric Hughes drafted what he called "a small statement of purpose" to explain what the group was about. This "cypherpunk manifesto" envisioned a home-brewed privacy structure that the government couldn't crack:

> Cypherpunks write code. They know that someone has to write to defend privacy, and since it's their privacy, they're going to write it. Cypherpunks publish their code so that their fellow cypherpunks may practice and play with it. Cypherpunks realize that security is not built in a day and are patient with incremental progress.
>
> Cypherpunks don't care if you don't like the software they write. Cypherpunks know that software can't be destroyed. Cypherpunks know that a widely dispersed system can't be shut down.
>
> Cypherpunks will make the networks safe for privacy.

A couple of days afterward, Hughes revealed the details of the second meeting, to be held on October 10 at Cygnus's new office in Mountain View. "Attendance is transitive trust, arbitrarily deep," he wrote. "Invite who[m]ever you want. . . . Do not, however, post the announcement. Time for that will come."

As indeed it would. By the following year, the list had expanded to more than 700 participants. The group's original reluctance to ban journalists from its meetings—an ironic stance for people so enthusiastic about the spread of information in the Internet age—faded. Soon, cypherpunk lore would be a staple in publications ranging from Wired magazine to the New York Times. (Their faces, hidden by masks with scrawled PGP public key "fingerprints" on them, adorned Wired's second issue.) The face of crypto had taken on a veneer of hipness.

Crypto anarchy was a fascinating concept, infecting not only the media but the well-ordered domains of corporations and government as well. Even Donn Parker, a well-known security expert who had previously specialized in assessments of computer crackers, was now weighing in on the danger of the "coming state of information anarchy if crypto is allowed to proliferate unchecked in its present form." (Parker recommended strong crypto, but with master keys in the hands of government—as it turned out, something that the government was already considering.)

But even as the crypto rebels were becoming media darlings, government threats, and civil liberties heroes, few were aware that the mathematical and philosophical basis of their efforts had come from a single man, arguably the ultimate cypherpunk. He never attended a meeting, didn't post to the list, and in fact had bitter running feuds with some of the people on it. Nonetheless, his ideas—and the patents he held on their implementations—were discussed with awe and fear both in the corporate and intelligence world. The creator himself was one of the most frustrating enigmas in the field, harder to crack than triple DES.

This was David Chaum.

Chaum, a bearded, ponytailed, Birkenstocked cryptographer and businessman, was the former Berkeley graduate student who had, on his own initiative, sustained the Santa Barbara Crypto conferences and organized the International Association for Cryptologic Research. But his legacy in the crypto world went far beyond that: for a number of years he was the privacy revolution's Don Quixote, idealistically pursuing crypto liberation from Big Brother. While at Berkeley in the late 1970s, he began building on the foundation of public key to create protocols for a world where people could perform any number of electronic functions while preserving their anonymity. If the use of public key is akin to magic, and if elaborations like secret sharing and zero-knowledge proofs are viewed as powerful examples of that magic, then David Chaum was the Houdini of crypto, inventor of mathematical tools that could deliver the impossible: all the benefits of the electronic world without the drawbacks of an electronic path that could lead crooks, corporations, and cops to one's doorstep. Magic, some believed, that potentially could make the entire concept of statehood disappear.

From a very early age, David Chaum had an interest in the hardware of privacy. "I think what's important to realize is that there is a strong driving force for me," he says. "My interest in computer security initially, and encryption later on, came because of my fascination with security technologies in general—things like locks and burglar alarms and safes." (At one point, as a graduate student, he even devised a new design for a lock and came close to selling it to a major manufacturer.) And, of course, he was completely fascinated by computers. Chaum was raised in suburban Los Angeles in a middle-class Jewish family (his birthdate is uncertain because of a characteristic refusal to divulge such specific identifying details). In high school and college—he began attending UCLA before graduating from high school, then enrolled at Sonoma State to be near a girlfriend, and finally finished up at UC San Diego—he did some garden variety computer pranking: password cracking, trash-can scrounging, and such. In math classes he hung out with a bunch of fellow malcontents: they would sit in the back of the class and every so often, when the teacher made an error, they would chime in with a counterproof. (Not exactly The Blackboard Jungle, but these were computer nerds.) He was also picking up a serious background in mathematics. And late in his college career, he came to cryptography, a discovery that in retrospect seems inevitable.

He had already been thinking about the means of protecting computer information, but his first serious thoughts on the subject were revealed in an English class paper. The politically radical young woman teaching the course had urged the students to write about what interested them passionately. Chaum wrote about encryption.

He chose Berkeley for graduate work, largely because of its association with the new paradigm of public key cryptography. He knew that Lance Hoffman

He chose Berkeley for graduate work, largely because of its association with the new paradigm of public key cryptography. He knew that Lance Hoffman, who taught there, had been Ralph Merkle's teacher. He was unaware that Hoffman had rejected Merkle's ideas out of hand. Still, he made good contacts at the school—he even met Whit Diffie, who was living in Berkeley then—and got the support he needed to begin his own work. Chaum's first papers, published in 1979, are indicative of the focus his work would take: devising cryptographic means of assuring privacy. His ideas built upon the concept of public key, particularly the authentication properties of digital signatures. "I got interested in those particular techniques because I wanted to make [anonymous] voting protocols," he says. "Then I realized that you could use them more generally as sort of untraceable communication protocols." The trail led to anonymous, untraceable digital cash.

For Chaum, politics and technology reinforced each other. He believed that as far as privacy was concerned, society stood at a crossroads. Proceeding in our current direction, we would arrive at a place where Orwell's worst prophecies were fulfilled. He delineated the problem in a paper called "Numbers Can Be a Better Form of Cash Than Paper":

> We are fast approaching a moment of crucial and perhaps irreversible decision, not merely between two kinds of technological systems, but between two kinds of society. Current developments in applying technology are rendering hollow both the remaining safeguards on privacy and the right to access and correct personal data. If these developments continue, their enormous surveillance potential will leave individual's lives vulnerable to an unprecedented concentration of scrutiny and authority.

In the early 1980s, David Chaum conducted a quest for the seemingly impossible answer to a problem that many people didn't consider a problem in the first place: how can the domain of electronic life be extended without further compromising our privacy? Or—even more daring—can we do this by actually increasing privacy? In the process he figured out how cryptography could produce an electronic version of the dollar bill.

In order to appreciate this, one must consider the obstacles to such a task. The most immediate concern of anyone attempting to produce a digital form of currency is counterfeiting. As anyone who has copied a program from a floppy disk to a hard drive knows, it is totally trivial to produce an exact copy of anything in the digital medium. What's to stop Eve from taking her one Digi-Buck and making a million, or a billion copies? If she can do this, her laptop, and every other computer, becomes a mint, and an infinite hyperinflation makes this form of currency worthless.

Chaum's way of overcoming that problem was the use of digital signatures to verify the authenticity of bills. Only one serial number would be assigned to a given "bill"—the number itself would be the bill— and when the unique number was presented to a merchant or a bank, it could be scanned to see if the virtual bill was authentic and had not been previously spent. This would be fairly easy to do if every electronic unit of currency was traced through the system at every point, but that process could also track the way people spent their money, down to the last penny. Exactly the kind of surveillance nightmare that gave Chaum the chills. How could you do this and unconditionally protect one's anonymity?

Chaum began his solution by coming up with something called a "blind signature." This is a process by which a bank, or any other authorizing agency, can authenticate a number so that it can act as a unit of currency. Yet, using Chaum's mathematics, the bank itself does not know who has the bill, and therefore cannot trace it. This way, when the bank issues you a stream of numbers designed to be accepted as cash, you have a way of changing the numbers (to make sure the money can't be traced) while maintaining the bank's imprimatur.

One of Chaum's most dramatic breakthroughs occurred when he managed to come up with a mathematical proof that this sort of anonymity could be provided unconditionally. The Eureka Moment came as he was driving his Volkswagen van from Berkeley to his home in Santa Barbara, where he taught computer science in the early eighties. "I was just turning this idea over and over in my head, and I went through all kinds of solutions. I kept riding through it, and finally by the time I got there I knew exactly how to do it in an elegant way."

He presented his theory with a vivid example: a scenario of three cryptographers finishing their meal at a restaurant and awaiting the check. The waiter appears. Your dinner, he tells the dining cryptographers, has been prepaid. The question is, by whom? Has one of the diners decided anonymously to treat his colleagues—or has the NSA or someone else paid for the meal? The dilemma was whether this information could be gleaned without compromising the anonymity of the cryptographer who might have paid for the dinner.

The answer to the "Dining Cryptographers" problem was surprisingly simple, involving coin tosses hidden from certain parties. For instance, Alice and Bob would flip a quarter behind a menu so Ted couldn't see it—and then each would privately write down the result and pass it to him. The key stipulation would be that if one of them was the benefactor who paid for the meal, that person would write down the opposite result of the coin toss. Thus if Ted received contradictory reports of the coin toss —one heads, one tails—he would know that one of his fellow diners paid for the meal. But without further collusion, he would have no way of knowing if it was Alice or Bob who paid. By a series of coin tosses and passed messages, any number of diners—in what would be called a DC-Net—could play this game. The idea could be scaled to a currency system.

"It was really important, because it meant that untraceability could be unconditional," he says— meaning mathematically bulletproof. "It doesn't matter how much computer power the NSA has to break codes—they can't figure it out, and you can prove that."

Chaum's subsequent work—as well as the patents he successfully applied for—built upon those ideas, addressing problems like preventing double-spending while preserving anonymity. In a particularly clever mathematical twist, he came up with a scheme whereby one's anonymity would always be preserved, with a single exception: if someone attempted to double-spend a unit that he or she had already spent somewhere else, at that point the second bit of information would allow a trace to be revealed. In other words, only cheaters would be identified—indeed, they would be providing evidence to law enforcement of their attempt to commit fraud.

This was exciting work, but Chaum received very little encouragement for pursuing it. "For many years it was very difficult for me to have to work on this sort of subject within the field, because people were not at all receptive to it," Chaum says. For a period of several years in the early 1980s, Chaum attempted to make personal connections with the leading lights in privacy policy and share his ideas with them.

"The uniform reaction was negative," he says. "And I couldn't understand this. It made it all the harder for me to keep pushing on this, because my academic advisors were saying, 'Oh, that's political, that's social—you're out of line.' " Even his advisor at Berkeley tried to dissuade him. "Don't work on this, because you can never tell the effects of a new idea on society," he told his stubborn student. Instead of heeding the warning, Chaum dedicated his dissertation to him, saying it was the rejection of the advisor's thinking that motivated him to finish the work.

Eventually, Chaum decided that the best way to spread his ideas would be to start his own company. By then he was living in Amsterdam; on an earlier visit with his Dutch girlfriend, he had fortuitously met up with some academics who offered him a post, which in turn led to an appointment at CWI, the Centre for Mathematics and Computer Science in Amsterdam. So, in 1990, he founded Digicash, with his own meager capital and a contract in hand from the Dutch government for a feasibility study of technology that would allow electronic toll payments on highways. Chaum developed a prototype by which smart cards holding a certain amount of verified cash value could be affixed to a windshield and high-speed scanning devices would subtract the tolls as the cars whizzed

holding a certain amount of verified cash value could be affixed to a windshield and high-speed scanning devices would subtract the tolls as the cars whizzed by. One could also use the cards to pay for public transportation and eventually for other items. Of course, the payments would be anonymous. To Chaum this was the most important part of the system: his fear was that a scheme that allowed officials to retrace the routes of citizens would be an Orwellian atrocity. (Systems eventually implemented in the United States, like the popular E-ZPass system, actually do track travelers.)

After completing that contract (the system was never implemented), Chaum kept his company active in smart-card applications; some of the projects focused on cash systems that would be used in a building or complex of buildings. He had a working example of it at Digicash headquarters on the outskirts of Amsterdam; visitors could sample the future by using anonymous cash cards to buy sodas and make phone calls.

But in the early 1990s, even as the world came around to the significance of the ideas Chaum had hatched in isolation—firms ranging from Microsoft to Citibank were pursuing digital cash projects—the company's operations remained relatively small scale. Digicash remained independent, without a close alliance with a large partner in banking or financial services. Chaum felt that in time these partners, at the least licensees who used Digicash technology, would emerge. They had to. It was now the conventional wisdom that paper money would be replaced by crypto-protected digits. When that happened, his paradigm would become a crucial factor in maintaining privacy in the age of e-money. This was an idea Chaum believed was worth holding out for.

Some people interpreted this as stubbornness, or, at least, poor business practice. "People wanted to buy David's patents but he asked for too much—he wanted control," says a former Digicash employee. Another tale making the rounds was that Chaum made a last-minute veto of a deal with Visa that would have made Digicash the standard for electronic money. A Digicash executive would later tell a reporter of similar blowups with other firms, including Microsoft. But Chaum furiously resisted the theory that his personality quirks and actions scotched realistic deals. When a reporter interviewed him about the subject, Chaum lashed out at the "malicious slander that it's hard to do deals with me." Still, frustrated by not being able to get Chaum's patents, some companies began devising their own schemes for anonymity, which may or may not have infringed on his patents.

Some cypherpunks felt that Chaum had taken the improper ideological approach by applying for patents on his work. (These idealists didn't like RSA's patents, either.) They complained that by withholding the technology from anyone who wanted to implement it—and threatening to sue anyone who tested the breadth of these patents—he was actually preventing his dream from being realized. This criticism enraged Chaum. "I really believe it's sort of my mission to do this, because I have this vision that stuff like this might be possible, and I really felt it was my responsibility to do it," he would say. "No one was working on this for a good half-dozen years while I was busily working on it and they all thought I was nuts. The patents are really helpful to our little company; we couldn't license, really, without the patents, and the whole purpose of them from my point of view is to get this stuff out there."

It was an article of faith among cypherpunks that protocols for anonymity would indeed flourish. This was not a foregone conclusion. Many tried to make their own schemes, with names like Magic Money. Meanwhile, Citibank and Visa were exploring digital cash on their own. And a well-funded new company called Cybercash was being formed outside of D.C.; one of its investors was RSA Data Security. The cypherpunks wanted to know whether this new form of money would provide an electronic trail to the user. They hoped not. The c-punk list was full of scenarios in which the Internet provided "data havens" outside the United States, places beyond the purview of the industrialized nations where people could bank funds or even gamble with digital cash. When some cypherpunks helped organize the first conference on financial cryptography, its location was a foregone conclusion: Anguilla, a small Caribbean island whose transactions laws were, to say the least, liberal.

One of Chaum's ideas, adopted wholeheartedly by cypherpunks, was the emergence of services called "remailers." These were sort of cyberspace information launderers . . . outposts on the information highway, independently maintained by cypherpunk activists, who stripped any identifying marks from a message, then passed it on either to its final destination or to another remailer, for another round of data scrubbing. Your message goes into the remailer (also known as an anonymous server) with a return address—and gets forwarded without one.

Just sending your anonymous message to a single remailer, though, was regarded as insufficient protection. Indeed, it imbued the person running the server with too much power. If he or she turned out to be untrustworthy, or got hacked, or was served with a subpoena, it would be all too easy for outsiders to get hold of one's return address. It was the same problem that Whit Diffie originally complained about with network administrators and passwords. The cypherpunks thought they had the solution to this problem: they helped seed a loose confederation of remailers around the globe. In order to get real protection, you had to direct your messages through a series, or "string," or "chain," of remailers. Each remailing service would strip the return address; only the first one would have the original address. A cop or a spy trying to trace a message would then have to get the records (if they still existed, which they generally didn't) of ten or twelve or twenty remailers in order to retrace the steps. So if the authorities couldn't get the records from some remailer nerd in Tonga, they'd never find the original. (Some paranoid users—or, more likely, cypherpunks airing out their software—went through as many as a hundred remailers on their string; since there weren't that many anonymity servers in the world, this required multiple visits.)

To be really sure your anonymity was protected, you'd use PGP to encrypt the whole shebang with the public key of the final remailer on the chain. That way no remailer until the final one would be able to read the message, which by then would have its origins well buried. Want more security? Encrypt that final message in another envelope of PGP encryption, this one scrambled with the public key of the penultimate remailer on the chain. That would provide a double layer of encryption. And so on and so on, envelopes within envelopes, until privacy was fully assured. If at any point along the way, someone attempted to read the message, they'd get gibberish, "like getting a tape of microphone hiss," gloated Eric Hughes.

With cypherpunk encouragement—the first remailer was set up by Hughes himself, on the Berkeley server—about twenty remailers were up and humming by 1993. Of all the barn-building efforts of those on the list, creating an easier way to utilize remailer chains was the most intense. It didn't seem to bother the cypherpunks that those using the nascent system weren't doing much to improve society. Most of the messages sent through remailers were postings to Usenet discussion groups on the Internet; sadly, these were generally harassing attacks on people or simply idiotic flames. Instead of enriching cyberspace conversations, these unsigned stink bombs degraded it. You'd have sophisticated on-line colloquies about technical issues or personal matters, and some moron would chime in with foul-mouthed insults—and the serious participants in the discussion would be frustrated because there'd be no way of applying sanctions to the conversational vandal who disrupted things. On the other hand, in some groups—notably those encouraging contributions from whistle-blowers or victims of sex crimes—otherwise reluctant message posters discovered a measure of security in having their messages attributed to alternate, untraceable identities known as "nyms." It wasn't unusual in such groups to see a lot of mail from clearly cloaked correspondents at sites like "bogus@no.return.address."

The hardest part of running a remailer, it turned out, was not technical. Cypherpunk scripts made the process fairly easy for the technically competent noncryptographer to set up an anon server. The tough part was standing up to the social and legal pressures that would come when outraged targets of hate mail and pranks would demand that the anonymous traffic cease. A typical case was a cypherpunk at the University of Washington who wanted to use the school's computer system as a remailer. For a few months things went fine, "which wasn't bad when you consider that it was based on a student account with a Nazi-like administration," wrote the operator. "The death blow was a target [of e-mail attacks] complaining to me about someone sending unsolicited mail

to them through my remailer." The plea to stop such mail went to the system "postmaster," the person in charge of the university's e-mail system. Of course, the postmaster didn't know anything about such a service being operated on the school's computer, and "when he looked into it, he was quite surprised." End of remailer.

More successful was the case of Julf Helsingius, a Finnish computer consultant who began a remailer in his home outside Helsinki in 1993. He wanted to provide cover to people posting in a Usenet group concerning alcoholic recovery. He set up "Penet" (a variation on his company's name, Pennitech) on a small UNIX machine running on a modest Intel 386 chip, and opened for business, relying solely on word of mouth for users. Soon thousands of people were sending messages through the machine, which would forward the messages to their destinations without the identifying header. The traffic got so intense that Julf had to install a high-speed Internet pipe in his home, which cost him a thousand dollars a month. Sometimes, users would write to Julf and ask him why he did it. The answer was complicated; Julf was part of the Swedish-speaking minority in Finland and had always felt strongly about the ability of minorities to speak up. In another sense though, he considered it a hobby. "Some people spend similar money on golf or whatever," he would say. When people complained that he was allowing creeps and perverts to express themselves, he had a reply for that too:

> I can only answer that I believe very firmly that it's not for me to dictate how other people ought to behave. But remember, anonymous postings are a privilege, and use them accordingly. I believe adult human beings can behave responsibly. Please don't let me down.

No matter what the result, the cypherpunk remailer effort generated a vital dialogue on the issue of anonymity in a digital society. One important cypherpunk text was Ender's Game, a science fiction novel by Orson Scott Card. Part of the plot hinged on an influential public debate between two unknown philosophers who took advantage of remailer-type technology to post treatises under the fictional nyms of Demosthenes and Locke. Since the ideas were subversive, it was absolutely necessary to keep their real identities secret; nonetheless, the force of their arguments changed the course of society in the novel. Another good reason to hide the real people behind these ideas was that the writers were children, a brother and sister who were, respectively, twelve and ten years old. "It's not my fault I'm twelve right now," the young man explained to his sister. "The world is always a democracy in times of flux, and the man with the best voice will win."

But it was not only science fiction that valued anonymity. The practice was crucial in the formation of the United States itself, and was arguably as American as apple pie. As cypherpunk historians loved to point out, the model for the Ender's Game debate may have been the Federalist Papers, with parts written by James Madison, John Jay, and Alexander Hamilton but published under the pseudonym Publius. And when Thomas Paine wrote Common Sense, he originally signed it "An Englishman." As the Supreme Court would note, "Anonymous pamphlets, leaflets, brochures, and even books have played an important role in the progress of mankind," a role the court has sustained in consistent rulings. In 1995, it would reaffirm the constitutionality of the concept once more, using the words of John Stuart Mill to hail anonymity as "a shield from the tyranny of the majority." Who could blame cypherpunks for producing the cryptographic tools to preserve a writer's ability to continue this vital tradition?

Plenty of people, as it turned out. Critics—among them FBI director Louis Freeh—would contend that when anonymity hit the Internet, it did not merely find a familiar niche in a new medium; it was amplified beyond recognition into something more menacing. David Chaum's invention of blind digital signatures and non-traceable anonymous cash had the potential to make cyberspace into an identity-free zone where one could go underground far more easily and effectively than in the physical world. When you spend hard currency in a store, for instance, no one asks you for ID papers—but your face marks the transaction in the cashier's mind, particularly if you're a return customer. (If you wore a bag over your head, you'd probably have trouble making the payment in the first place.) Using Chaumian protocols, you could potentially make all your purchases, send all your mail, even receive monies, with total assurance that no one would know who you are. But so could kidnappers, child pornographers, and terrorists, whose lives would be made much simpler and more secure with such tools.

Such concerns didn't faze the cypherpunks. On the contrary, they went out of their way to emphasize why the technologies of anonymity could be so controversial. A good example was Tim May's announcement of an enterprise he called "BlackNet." The group did not exist, of course. It was a thought experiment he originally figured to bring up for discussion at a cypherpunk meeting, but then decided to send it out anonymously on the Net. "I sent it through remailers so it would add a piquancy, a spiciness to it," says May, who certainly didn't mind going public with his own beliefs (he usually signed his e-mail with a hair-raising list of passions—"crypto anarchy, digital money, anonymous networks, digital pseudonyms, black markets, and collapse of governments").

BlackNet was a guerrilla theater presentation of those interests. "Your name has come to our attention," the message began. "We have reason to believe you may be interested in the products and services our new organization, BlackNet, has to offer. BlackNet is in the business of buying, selling, trading, and otherwise dealing with information in all its many forms." The offer went on to explain that with public key cryptography, a perfect data black market exists where one can get or sell everything from trade secrets to cruise missile plans without any risk of being identified. The parties in these transactions will not be known to each other, not even to BlackNet. Needless to say, no one would ever know who is behind BlackNet:

> Our location in physical space is unimportant. Our location in cyberspace is all that matters. Our primary address is the PGP key location "BlackNet" and we can be contacted (preferably through a chain of anonymous remailers) by encrypting a message to our public key (contained below) and depositing this message in one of the several locations in cyberspace we monitor.

BlackNet also purported to deal in money, offering to make anonymous deposits in the bank of your choice. You could deal with BlackNet using actual cash or "cryptocredits," BlackNet's own internal currency (which could be used in any sort of untraceable clandestine information transaction you chose). And BlackNet itself had no ideology of its own, save one: "We consider nation-states, export laws, patent laws, national security considerations, and the like to be relics of the pre-cyberspace era."

To May's delight, many accepted the BlackNet announcement at face value, especially as news of it leaked beyond the crypto community and into the more panic-prone world at large. Though BlackNet was fictional, May did believe that in the future we would see similar enterprises. It didn't bother him at all—people were free agents, and responsible for themselves. "If people die as a result of this . . . eh!" he said. "I didn't hurt them."

All in all, the exercise put a screaming exclamation point to cypherpunk philosophy. Crypto anarchy until then may have been the province of science fiction writers, but the tools to make it real were arriving. As those digital armaments were put to use, it was possible that a thousand BlackNets could bloom. Certainly this was something noted inside the Triple Fence—and at FBI headquarters as well. Did it portend a movement that had to be stopped? The establishment was beginning to think so.

With the powers of crypto, "we have the capability of 100 percent privacy," admitted security expert Donn Parker. "But if we use this, I don't think society can survive."
